eBook edition January, 2010

Britannica may be accessed at <http://www.britannica.com> on the Internet.

How to go to your page

This eBook contains 14 volumes. Each volume has its own page numbering scheme, consisting of a volume number and a page number, separated by a colon.

For example, to go to page 5 of Volume 1, type V3:5 in the "page #" box at the top of the screen and click "Go." To go to page 5 of Volume 2, type V2:5... and so forth.

How to Use the Britannica Student Encyclopedia

The 16 volumes of the *Britannica Student Encyclopedia* from Encyclopædia Britannica contain articles on more than 2,200 topics. The articles are arranged in alphabetical order from

“Aardvark” in Volume 1

to “Zuni” in Volume 15.

The last volume is the index.

Getting Started

There are several ways to find the information you want.

If you are looking for a particular title you can go to the volume that contains articles that start with the same letter and search for your topic there. For example, if you want to read the article on the American Revolution, you can go to the A volume. The words at the top of each page tell you which article is on that page. When you are looking for an article you can page through quickly by looking at those words.

Sometimes there are different ways of naming the same subject. A feature called a title cross-reference can help guide you to the title that we have used. For example, if you look for an article called “Car” in the C volume you will find a note that says

Car

▶ see Automobile.

Then you can look for the Automobile article in the A volume.

You can also search for your topic in the index. If there is an article on your topic the index will tell you which volume and page number to go to to find that article. Sometimes a topic does not have its own article, but you can still find information about that topic in the encyclopedia. The index can tell you where you can find that information. For example, if you look up the topic “dragon” in the index you will see that there is information about dragons in the article called “Animals, Legendary” even though there is no article on dragons.

In addition to the text of the articles, there are many special features that add information.

Most articles have at least one photograph, illustration, or map. Many have more than one.

At the end of most articles, there is a feature called “More to explore.” This feature tells you which articles to go to to get more information about the topic or about something that was mentioned in the article.

“Did You Know?” boxes provide quick facts about many different articles throughout the set.

Certain articles have additional special features.

...and slaves of their own. These slaves worked on large farms that supplied food for the army and the royal court.

The colony grew larger and stronger throughout the 1700s. After Great Britain and other countries outlawed the slave trade in the 1800s, Dahomey started selling slaves on oil instead of slaves.

At the end of the 1800s, France conquered Dahomey. The French combined it with other regions to form a colony that was also called Dahomey. This colony gained its independence in 1960. It kept the name of Dahomey until 1975, when it became Benin.

18 | Connecticut

Connecticut

The state of Connecticut was named for the Connecticut River. Algonquian Indians called the river Quinnebaug, meaning "Land on the long tidal river." Connecticut is nicknamed the Constitution State because its early settlers wrote a set of laws to govern themselves that later provided ideas for the U.S. Constitution. These laws, known as the Fundamental Orders of Connecticut, were created in 1638 and covered such issues as elections, powers of officials, and taxation. The capital of Connecticut is Hartford.

Geography

Connecticut is the smallest New England state. It is bordered by Massachusetts to the north, Rhode Island to the east, New York to the west, and the Long Island Sound to the south.

Connecticut has highlands in the west and east with a lowland in the middle. The northern part of the western high-

lands is called the Litchfield Hills. They include Mount Mansfield, which is the state's highest point at 2,381 feet (725 meters). The central lowland includes the fertile Connecticut River valley. The eastern highlands are low, wooded hills with many rivers.

People

At the time of the first U.S. census, in 1790, almost all of Connecticut's people were English. In the 1800s, Irish, French Canadian, Italian, Polish, and other European immigrants settled in the state. Today more than four-fifths of Connecticut's residents are of European heritage: African Americans and Hispanic each make up about 9 percent of the population. The state's Asian American and Native American groups are small.

Connecticut has a large population for its size. As a result, it is one of the country's most crowded states. Most of its people live in cities or towns. Bridgeport, on the coast, is the largest city. Other large cities are Hartford, New Haven, and Stamford.

Economy

Real estate, finance, and the insurance industry are major parts of Connecticut's economy. Hartford is known as the Insurance Capital of the World because of the many insurance companies with offices there. Manufacturing businesses in Connecticut produce jet aircraft engines, computer equipment, chemicals, machinery, and other goods. Hart-

154 | Bush, George

BRITANNICA STUDENT ENCYCLOPEDIA

Bush, George

After serving two terms as vice president, George Bush became the 43rd president of the United States in 1989. The main event of George's presidency was the Persian Gulf War.

Early Life

George Herbert Walker Bush was born on June 12, 1924, in Milton, Massachusetts. His family later moved to Greenwich, Connecticut. George was the second of five children born to Prescott Sheldon Bush and Dorothy Walker Bush. His father was a banker and later a U.S. senator.

In 1942 Bush joined the U.S. Naval Reserve. As a Navy pilot, he flew many missions in the Pacific during World War II. In 1945 Bush married Barbara Pierce. After the war he attended Yale University and earned a degree in economics. Bush then moved to Texas.

George Bush won the 41st U.S. election.

Acropolis means “city at the top” in Greek.

(See Acropolis.)

Airships float in the air like balloons, but they have engines and can be steered.

(See Airship.)

Alchemists were people who were famous for trying to turn lead into gold.

(See Alchemy.)

Almonds are commonly called nuts, but they are actually seeds.

(See Almond.)

At least six types of amoeba are found in human beings.

(See Amoeba.)

Knights in Europe once wore armor made of large steel or iron plates.

(See Armor.)

Aardvark

Although armadillos look like anteaters, they are actually related to elephants, manatees, and dugongs.

The unusual mammal called the armadillo was named by South Africans in the early 1800s. In the local language, Afrikaans, “armadillo” means “earth pig.” This name aptly describes a large, heavily built animal with thin hair and short, stumpy legs. The scientific name of the armadillo is *Orycteropus afer*.

Armadillos live in dry places in Africa south of the Sahara Desert. The armadillo can reach a length of 6 feet (1.8 meters). Its head has huge donkeylike ears, a long snout, and drooping eyelids with long lashes. During the day armadillos sleep in underground burrows. At night they dig underground for their favorite food, termites. They break open the termites’ nests with their massive, flattened claws. Then they suck up the insects with their long tongue.

Female armadillos give birth to one baby per year. After a few weeks the baby begins to follow its mother around. It goes off on its own before it is 1 year old. Armadillos can live for more than 20 years in zoos.

Aaron, Hank

On April 8, 1974, major league baseball star Hank Aaron hit his 715th home run. That home run broke Babe Ruth’s record of 714, which had stood since 1935. Aaron broke several other batting records as well. Because he hit so well he was sometimes called Hammerin’ Hank.

Early Life

Henry Louis Aaron was born on February 5, 1934, in Mobile, Alabama. Even as a young boy Hank hoped to play professional baseball. At age 16 he began playing shortstop with the semiprofessional Mobile Black Bears baseball team.

Career

Aaron began his professional career in 1952. He played a few months as a shortstop with the Indianapolis Clowns of the Negro American League. In 1954

Hank Aaron

Aaron joined the Boston Braves of the National League, where he played mostly as an outfielder.

In 1955 Aaron established himself as a star. He had a .314 batting average, 27 home runs, and 106 runs batted in (RBI). In 1957 he helped lead the Braves to their first World Series title.

The Braves moved to Atlanta, Georgia, at the end of 1965, and Aaron moved with them. After the 1974 baseball season, he was traded to the Milwaukee Brewers of the American League.

Retirement

Aaron retired after the 1976 season with a lifetime batting average of .305. He was elected to the Baseball Hall of Fame on January 13, 1982. At the time he held several career batting records, including 755 home runs, 1,477 extra-base hits, and 2,297 RBIs. His home run record was broken in 2007 by Barry Bonds.

Baseball • Ruth, Babe

Abacus

Long before the invention of the electronic calculator or the computer, people counted and did calculations with a device called an abacus. On this instrument, calculations are made with beads, or counters, instead of numerals. The beads are arranged on wires stretched across a frame. Each wire represents the ones, tens, hundreds, and so on.

The abacus is an ancient device to help solve math problems.

The abacus was probably invented in Mesopotamia by an ancient group of people known as Sumerians. The ancient Egyptians, Greeks, Romans, and Chinese all used the abacus as well.

In about AD 700 the Hindus invented a numeral system that made adding with written numbers as easy as adding on an abacus. The Arabs soon adopted this system, and they introduced it into Europe more than 1,000 years ago. As written calculations became easier, the abacus passed out of use in Europe. But it continues to be used by people in China, Japan, and the Middle East.

Did You Know?

An abacus expert can add numbers almost as fast as a person with a pocket calculator.

Abbreviation

An abbreviation is a shortened form of a word or a phrase. People use abbreviations to save time and space. People are always creating new abbreviations, and old ones are sometimes forgotten.

Some abbreviations are official, such as the codes that the U.S. Postal Service uses for the states. Others are more informal. People often use the abbrevia-

Some Common Abbreviations	
AD	<i>anno Domini</i> (in the year of the Lord)
AM	<i>ante meridiem</i> (before noon)
Ave.	Avenue
BC	before Christ
Blvd.	Boulevard
C	Celsius, centigrade
CD-ROM	compact disc read-only memory
cm, m, km	centimeter, meter, kilometer
Dr.	Doctor
DVD	digital videodisc
F	Fahrenheit
ft	foot, feet
g, kg	gram, kilogram
IOU	I Owe You
Jr.	Junior
l	liter
mph	miles per hour
no.	<i>numero</i> (number)
oz.	ounce
PM	<i>post meridiem</i> (after noon)
Rd.	Road
Sr.	Senior
St.	Saint, Street
vs.	<i>versus</i> (against)

tion ad for the word advertising, for example.

There are a few different kinds of abbreviations. People often abbreviate words by writing only the first letter, one or a few other letters in the word, and a period. For instance, the word teaspoon is abbreviated as “tsp.”

People abbreviate phrases by writing only the first letter of each word. This type of abbreviation is usually written in capital letters with no periods between them. For example, the abbreviation for “as soon as possible” is ASAP.

One of the most common types of abbreviation is called an acronym. Acronyms combine the first letters of a group of words to create a new word. NASA, which stands for National Aeronautics and Space Administration, is an acronym. It is pronounced “NA-suh,” not “N-A-S-A.”

U.S. Postal Codes					
AK	Alaska	KY	Kentucky	NY	New York
AL	Alabama	LA	Louisiana	OH	Ohio
AR	Arkansas	MA	Massachusetts	OK	Oklahoma
AZ	Arizona	MD	Maryland	OR	Oregon

KS	Kansas	NV	Nevada	WY	Wyoming

Some acronyms become so common that they begin to be used as real words rather than as abbreviations. The word laser started out as an acronym. Its full scientific meaning is “light amplification by stimulated emission of radiation.”

Abernathy, Ralph

Ralph Abernathy

Ralph Abernathy was a leader of the civil rights movement in the United States. He worked closely with Martin Luther King, Jr.

Ralph David Abernathy was born on March 11, 1926, in Linden, Alabama. In 1948 he became a minister in the Baptist church. In 1950 he graduated from Alabama State University with a degree in mathematics. Then he studied sociology at Atlanta University in Atlanta, Georgia.

In 1951 Abernathy became pastor of the First Baptist Church in Montgomery, Alabama. A few years later he met Mar-

tin Luther King, Jr. The two men began fighting laws that kept blacks and whites separated.

One such law forced blacks and whites to sit in separate parts of buses. In 1955 Abernathy and King organized a protest of the Montgomery bus system. Blacks refused to ride the buses until the seating rules were changed. This protest helped start the civil rights movement.

In 1957 King and Abernathy started the Southern Christian Leadership Conference (SCLC). The SCLC was an organization that worked to win equal rights for blacks. After King was murdered in 1968, Abernathy became president of the SCLC.

Abernathy resigned as president of the SCLC in 1977. Then he went back to being a pastor in Atlanta. He died there on April 17, 1990.

Abidjan

Population
(2005 estimate)
urban area,
3,576,000

Abidjan is the largest city of Côte d'Ivoire in West Africa. It was the country's capital until 1983. Then Yamoussoukro was made the capital. Even after that

The coastal city of Abidjan is an important business center of Côte d'Ivoire.

date, however, Abidjan remained the site of most government functions.

Abidjan is located in the southern part of the country. It has a port even though it is separated from the Atlantic Ocean by a sandbar. The Vridi Canal connects the port to the sea.

Because of the port, Abidjan is a center of West African trade. Cocoa, coffee, timber, bananas, pineapples, and fish are shipped from the port. The city also manufactures beer, soap, matches, and automobiles.

Abidjan became the capital of the French colony of Ivory Coast in 1934. Ivory Coast became the independent country of Côte d'Ivoire in 1960. Abidjan remained the capital.

Abnaki

The Abnaki (or Abenaki) were a group of Native American tribes who originally

lived in what are now New England and eastern Canada. They included the Passamaquoddy, the Penobscot, and the Pennacook.

The Abnaki hunted animals such as bear, deer, and moose in the forests. They fished in lakes and rivers. The coastal tribes caught lobsters and gathered oysters and clams. The southern tribes planted fields of corn, squash, and beans.

The Abnaki generally lived in small bands of related families. Bands lived part of the year in permanent villages and part of the year in hunting camps. Their houses were cone-shaped wigwams made from a wooden frame covered with bark.

In the early 1600s Europeans began arriving in Abnaki territory. Most were traders who offered metal tools and other European goods in exchange for furs. But the Europeans also brought diseases such as smallpox that killed tribespeople by the thousands.

Abnaki Native Americans perform a traditional dance in Vermont.

After the American Revolution (1775–83) the Americans took over much of the tribes' territory. Without land, the Abnaki could no longer live in their traditional way. Some managed to change their way of life and survive. In the late 20th century about 1,000 Abnaki lived in Quebec, Canada. More than 6,000 Abnaki lived in the United States.

Native Americans

Abolitionist Movement

In the late 1700s people who were opposed to slavery began a movement to abolish, or end, the practice. This was called the abolitionist movement. Followers of the movement were known as abolitionists.

Europeans had begun using Africans as slaves in the late 1400s. After Europeans discovered the Americas they set up colonies there. Soon many Africans were being shipped to the Americas to work on the sugar and cotton plantations in the colonies.

In the 1600s certain people in the British colonies of North America condemned slavery on religious grounds. There were few other protests, however, until the 1700s. Slowly but steadily, more and more people became opposed to the idea of holding other human beings as private property.

An antislavery meeting is pictured in London, England, in 1840.

Antislavery Efforts Around the World

The first formal organization to emerge in the abolitionist movement was the Abolition Society, founded in 1787 in Britain. By 1807 Britain had abolished the slave trade with its colonies. By 1833 all slaves in the British colonies in the Western Hemisphere were freed. Other countries in Europe soon followed this example. France outlawed the slave trade by 1819, and in 1848 slavery was banned in all French colonies.

Slavery was abolished country by country in South America. In Chile the first antislavery law was passed as early as 1811. Slavery finally ended in South America when Brazil passed an antislavery law in 1888.

United States

In the United States the slave trade was officially abolished in 1807, but the smuggling of slaves continued until the Civil War. As cotton plantations devel-

oped in the South, the demand for slaves increased. The Southern states thus supported slavery. In contrast, by 1804 all of the states north of Maryland had abolished slavery. The North became the center of the abolitionist movement in the United States.

The best-known leader of this movement was William Lloyd Garrison. He founded the American Anti-Slavery Society in 1833. The U.S. abolitionists did not always agree about how to end slavery, however. Some wanted the government to pass laws to end slavery. Others tried to help individual slaves gain their freedom. They established the Underground Railroad to help escaping slaves reach places of safety in the North or in Canada.

The abolitionist movement gained strength as more and more people learned about the evils of slavery. People were disgusted by the cruelty of the slave hunters who brought escaped slaves back to their owners. Harriet Beecher Stowe's novel *Uncle Tom's Cabin* (1852) presented powerful descriptions of how

William Lloyd Garrison

Cassius Marcellus Clay worked to end slavery even though he was from a slaveholding family in the South.

slaves were mistreated. The book became extraordinarily popular.

In November 1860 Abraham Lincoln was elected president of the United States. Lincoln opposed the spread of slavery. The South felt threatened. Over the next three months a series of Southern states separated from the United States and formed the Confederacy. This led to the American Civil War (1861–65). During the fighting, in 1863, Lincoln issued the Emancipation Proclamation. This document freed all slaves in the Confederate states. In 1865 the Confederacy was defeated. Then slavery was abolished in the United States by the 13th Amendment to the Constitution.

Did You Know?

An abolitionist named John Brown stole weapons from the U.S. government in 1859. He wanted to start a slave rebellion. He was killed but became an abolitionist hero.

Aboriginal Peoples

Aboriginal peoples, or aborigines, are groups of people who have lived in one area for many thousands of years. In the past, aborigines lived in areas far from other cultures. They were unknown until outsiders came into their lands.

Today there are only a few places left in the world where outsiders have not affected aboriginal cultures. Aborigines still live in the rain forests of South America, on the island of New Guinea, and in the mountains of Malaysia and the Philippines. They have kept many of their original ways of life.

The Australian Aborigines are probably the best-known aboriginal society. They came to Australia more than 40,000 years ago. They still live there today.

Australian Aborigines were originally hunter-gatherer tribes that moved from

place to place to find food and water. They lived in caves or built short-term shelters from branches, bark, and animal skins. The men fished and hunted for animals. The women gathered plants, eggs, and other food.

The Aborigines' lives changed when Europeans arrived in Australia more than 200 years ago. The Europeans forced the Aborigines to move off their land and to change their way of life. Many Aborigines died defending their land. Many others died from diseases brought by the Europeans.

Today Aborigines live in all parts of Australia and do all kinds of work. But many Aborigines are poor. They do not have the same opportunities as most other Australians.

Abraham

Abraham is an important figure in the Jewish, Christian, and Islamic religions. He is considered to be the patriarch, or founding father, of the nation of Israel.

The story of Abraham is told in Genesis, the first book of the Bible. In modern times archaeologists have found ancient clay tablets that tell more of the story.

According to the Bible, Abraham came from Ur in Mesopotamia (now Iraq). His people were shepherders who moved from place to place. About 4,000 years ago they settled near Haran, in

An Australian Aborigine stands before a large rock known as Uluru/Ayers Rock. Parts of the rock and the land around it are sacred to the Aborigines of the area.

Christians, Jews, and Muslims all see Abraham as an important religious figure. A painting shows Abraham during his journey to Canaan.

what is now Turkey. There God instructed Abraham to leave his people and move to a new land. Abraham obeyed.

At age 75 he journeyed to Canaan (the land that is now Israel) with his wife, Sarah, and others. God told him that he and his children would inherit that land. At first Abraham and Sarah thought they were too old to have children. Abraham's first child, Ishmael, was born to a servant of Sarah's. But Isaac was born later to Sarah. The Bible says that Abraham died at the age of 175.

Isaac inherited the land of Canaan. After his death the land went to his son, Jacob. God changed Jacob's name to Israel. His descendants were the Jewish people. In Christianity, Abraham is considered to be the father of all who believe in God. Abraham is important to Muslims as well. They are said to be the

descendants of Abraham's son Ishmael. In the Koran, the holy book of Islam, it is said that Abraham and Ishmael built the Kaaba. The Kaaba, a shrine in Mecca, Saudi Arabia, is the holiest place in the Islamic world.

Abu Bakr

Abu Bakr was an adviser to the prophet Muhammad, the founder of Islam. After Muhammad's death, Abu Bakr took charge of the Islamic world. He is known as the first caliph.

Abu Bakr (second from left) was an important Islamic leader.

Abu Bakr was born in the Arabian town of Mecca (now in Saudi Arabia), which was also the birthplace of Muhammad. His daughter 'A'ishah became one of Muhammad's wives.

While Muhammad was dying, he called upon Abu Bakr to lead prayers and pilgrimages in his place. By that time Muhammad was more than the religious leader of the Islamic lands; he was their political ruler as well. After Muhammad died in 632, Abu Bakr ruled as caliph. Caliph means "successor" (one who comes afterward). The Islamic lands were called the Caliphate.

As caliph, Abu Bakr fought wars against Arabian tribes who rebelled against him. He soon brought the tribes of Arabia under Muslim rule. Abu Bakr then sent armies into what are now Syria and Iraq. This began a series of conquests that spread Islam far beyond Arabia. Abu Bakr died in 634.

Abu Dhabi

Population
(2007 estimate)
633,140

Abu Dhabi is the capital of the United Arab Emirates, a union of Arab states on the Arabian Peninsula. It is also the capi-

The Sultan Zayed Mosque in Abu Dhabi was named for a longtime ruler of the United Arab Emirates. The sultan was buried in the mosque when he died in 2004.

tal of Abu Dhabi kingdom, the largest of the seven states.

The city of Abu Dhabi occupies most of a small triangular island in the Persian Gulf. The island is connected to the mainland by a short bridge.

Local tribesmen settled Abu Dhabi in 1761. Through most of its history the town remained small and undeveloped. This changed when rich oil fields were discovered in Abu Dhabi in 1958. Oil revenues were used to modernize the town. Electricity, running water, and a central sewage system were installed. Modern buildings and a new port were built. With modernization, the population grew.

The United Arab Emirates gained independence from Great Britain in 1971. Abu Dhabi became the permanent capital of the federation in the early 1990s.

Abuja

Population
(2006 census),
Federal Capital
Territory,
1,405,201

Abuja is the capital of the African country of Nigeria. It was built in the 1980s to replace the crowded coastal city of Lagos as the capital.

Abuja is located near the center of Nigeria in an area called the Federal Capital Territory. It is about 300 miles (480 kilometers) northeast of Lagos. The city is built on the grass-covered Chukuku Hills. The climate is cooler and less humid than that of Lagos.

Abuja is divided into two zones. The central area contains the government buildings. The other zone provides housing, shopping facilities, and other services for the people who live there.

The Nigerian presidential palace is located in the hills of the country's capital, Abuja.

The government started planning the new city of Abuja in 1976. It took more than 10 years to build the city, but the population grew even before it was finished. Abuja officially became the capital in 1991.

Accra

Population
(2003 estimate)
1,847,432

Accra is the capital and largest city of the West African country of Ghana. Its name comes from the word *nkran* in the Akan language. This refers to the black ants that thrive in the area. Accra is situated on the Gulf of Guinea.

Accra is the site of Ghana's main government offices. It is also the economic center of Ghana. It contains the head offices of all the country's large banks and trading firms. The city also has large open markets. Its main products are processed food, lumber, and textiles.

The city of Accra was formed in 1877. By that time the British had gained control of the whole area. It became known as the colony of the Gold Coast. Accra was the capital of the colony. The modern city of Accra was carefully planned and laid out between 1920 and 1930.

When the Gold Coast gained independence as Ghana in 1957, Accra remained the capital.

Acid and Base

Acids and bases are two related groups of chemicals. They are important to living things and have many uses in industry.

Acids

Some acids are found in food. They include acetic acid in vinegar, lactic acid in milk, and citric acid in lemons. They often have a sour taste. Other acids are found in animals. The stomach makes an acid that helps break down food.

Some acids do not come from living things. These can be so strong that they can corrode, or break down, metals. They should not be tasted or touched. Sulfuric acid is one example. It is used to make fertilizers, dyes, drugs, explosives, and certain batteries. When an acid is dissolved in water the result is called an acidic solution.

Bases

Bases may feel slippery in water. Some are used in foods or medicines. These often have a bitter taste. Examples of bases include baking soda and milk of magnesia. Other bases are used in manufacturing. These are too strong to be tasted or touched. Sodium hydroxide, or lye, breaks down animal and plant tissues. It is used to make soap, paper,

and artificial fibers. When water is combined with a base the result is called a basic, or alkaline, solution.

Acid-Base Reactions

When acids and bases are combined they produce water and compounds called salts. They have a salty taste and none of the characteristic properties of either acids or bases. The reactions between acids and bases can be quite strong. One result is that they can quickly produce gases. This is why baking soda is useful for baking pastries and cakes. When it is combined with an acid such as lemon juice or sour cream in a dough mixture, it releases gases that make the dough rise.

Identifying Acids and Bases

Acids and bases make some materials change color. A special kind of paper called litmus paper is one type of mate-

A strip of litmus paper shows that a solution contains an acid. If the solution contained a base the paper would have turned blue.

rial that does this. An acid in water turns litmus paper red. A base in water turns the paper blue. A neutral substance, such as pure water, gives litmus paper a color midway between red and blue.

Acid Rain

Acid rain is a form of air pollution. When coal and petroleum are burned in automobiles, electric power plants, and factories, they release certain harmful gases into the air. These gases combine with the oxygen and water in the air. When the water in the air comes down as rain, sleet, hail, or snow, it carries with it these gases. This is known as acid rain. Acid rain is very damaging to all life forms.

Acid rain can pollute lakes and streams, killing the fish and other organisms that live in them. Acid rain also damages various kinds of vegetation, including farm crops and trees. In addition, acid

Acid rain can be very damaging to trees and other plants. The branch on the left has been affected by acid rain. It looks much different than the branch on the right.

rain corrodes, or wears away, surfaces of buildings and other structures.

By the early 1990s tens of thousands of lakes had been destroyed by acid rain. The problem has been most severe in Norway, Sweden, and Canada. Damage from acid rain is not limited to the countries that produce the pollution. This is because winds carry the pollution around the globe.

Despite much discussion between many countries, there is still no clear solution to the problem. The chief reason is that it is expensive to control the pollution. However, since the damage from acid rain to the environment is permanent, the environmental costs are greater.

Acne

Most teenagers and some adults experience a skin condition called acne. Some cases of acne are very mild and go away without leaving any signs. Others are more serious and may cause scarring. Boys are more likely than girls to have severe acne.

Lesions (abnormal bumps or spots) on the skin are the main symptom of acne. Acne lesions are commonly known as pimples. They occur especially on the face and neck.

Acne is caused by changes inside the body that affect the skin. These changes occur naturally as a boy or girl reaches puberty, or matures. At that time the body produces more of chemicals called

Bumps called pimples are the main sign of acne.

hormones. Some of those hormones speed up the skin's production of oil. The extra oil clumps together with dead skin cells to clog pores, or tiny openings in the skin. As the oil gland under a clogged pore makes more oil, the pore swells up to form a pimple.

There is very little a person can do to prevent acne. However, there are treatments for clearing up acne and ways of preventing acne from getting worse.

Washing the skin twice a day with a mild soap can be helpful. This removes some oil and dead skin cells that help to clog skin pores.

In some cases a doctor may prescribe medicine to treat infections caused by acne. Doctors may also suggest medi-

cated lotions or creams that can be put on the skin.

Acropolis

Ancient cities were often built around a fortress on top of a hill. When a city spread to the area below, the high part came to be called the acropolis, which means "city at the top" in Greek. The best-known acropolis is in Athens, Greece.

The buildings of the Athens Acropolis were made mostly of white marble. Parts of some of the buildings, including a temple called the Erechtheum, are still standing today. The Erechtheum had a porch with marble columns in the shape of female figures.

The most famous surviving building is the Parthenon. The Parthenon was built almost 2,500 years ago and was dedicated to the goddess Athena. Athens was later ruled by Christians who made the

The ruins of the Parthenon stand out on the Acropolis in Athens, Greece.

Parthenon a church. In the 1400s Turkish forces took control of the Acropolis and made the Parthenon an Islamic mosque. In 1687, during a war, some gunpowder stored there exploded, destroying the middle of the building.

In 1801 a British diplomat named Lord Elgin took many sculptures and carved panels from the Parthenon and brought them to England. They were put on display at the British Museum. The Greek government, however, asked for their return to Greece. The sculptures remained on display while the dispute continued into the 21st century.

Acupuncture

A woman receives an acupuncture treatment.

Acupuncture is an ancient Chinese form of healing. It involves piercing the skin with thin needles to relieve pain. Today

acupuncture is also popular in Europe, the Americas, and Australia.

Modern doctors accept that acupuncture can control pain and nausea. Some doctors recommend acupuncture along with regular medical treatments for such ailments as asthma, high blood pressure, indigestion, and stress. Doctors in China have even used acupuncture instead of drugs to stop pain during surgery.

People who practice acupuncture must take courses to learn how to do it correctly. In many places only medical doctors may perform acupuncture.

During treatment the patient lies on a table while the acupuncturist sticks special needles into certain points on the body. The needles are made of metal and are about as thick as a human hair. They normally go less than 0.5 inch (1 centimeter) into the skin. There are hundreds of possible points where the needles can be stuck, each with a different effect.

Doctors are not sure how acupuncture works. Some think that the needles cause the body to produce pain-killing chemicals. Others think that the needles block pain signals from traveling along the nerves to the brain. Some think that acupuncture acts like a placebo—a treatment that works only because patients believe it will.

Adams, Abigail

Abigail Adams was the wife of President John Adams and the mother of Presi-

Abigail Adams

dent John Quincy Adams. Her reading and her family life gave her a good understanding of politics. She strongly favored American independence and universal liberty. She was also determined to overcome the limits that were placed on women at the time.

Abigail Smith was born on November 22, 1744, in Weymouth, Massachusetts. As a girl she studied the books in her father's large library. Women could not go to college then, but Abigail received a good education at home.

In 1759 Abigail met the young lawyer John Adams. They shared interests in reading, writing, and politics. They married in 1764 and settled on a farm in Braintree (now Quincy), Massachusetts. They had five children. Abigail, John Quincy, Charles, and Thomas survived to adulthood.

John Adams' law practice and political duties kept him away from home much of the time. Abigail Adams stayed in touch with her husband and other

family members by letter. Her letters are full of her opinions on the important issues of the day. This was during the time when the American colonies began to fight for independence from Great Britain. She wrote in favor of American independence. Like her husband, she also believed that slavery had no place in a country dedicated to freedom.

In 1789 John Adams became the first vice president of the United States. Eight years later he became the second president. Even during those terms Abigail was often in Massachusetts running the family farm. In 1800, however, she moved with the president into the White House, which was unfinished at the time.

After Adams' term as president he and Abigail returned to Quincy and settled comfortably into retirement. Abigail died on October 28, 1818.

Abigail Adams supported womens' rights. She told her husband John Adams to "remember the ladies" during the fight for U.S. independence.

1927. That year he published his first collection of photographs.

In 1940 Adams helped found the world's first museum collection of photographs at the Museum of Modern Art in New York City. In 1946 he established the first academic department to teach photography as a profession. He did that at the California School of Fine Arts in San Francisco.

Adams was a nature lover throughout his life. He published many collections of photographs that he took in the wilderness areas of the United States. They include *My Camera in the National Parks* and *Photographs of the Southwest*.

In 1980 Adams was awarded the Presidential Medal of Freedom, the highest nonmilitary honor in the United States. He died on April 22, 1984, in Carmel, California.

Adams, John

John Adams was the second president of the United States.

As a lawyer in the American colonies, John Adams fought for independence from Great Britain. He went on to become the first vice president and the second president of the new United States.

Early Life

John Adams was born in Braintree (now Quincy), Massachusetts, on October 30, 1735. His father was a farmer and a community leader. After graduating from Harvard College in 1755, Adams became a lawyer. In 1764 Adams married Abigail Smith. They had five children. One daughter died in infancy.

Revolutionary Era

Adams became a leader in the fight against British laws in the colonies. Still,

TIMELINE

Adams is born in Braintree (now Quincy), Massachusetts.

October 30, 1735

Adams joins the Continental Congress.

1774

Adams helps create the Treaty of Paris, which ends the American Revolution.

1783

Adams becomes vice president under President George Washington.

1789

Adams is elected president.

1796

Adams loses the presidency to Thomas Jefferson.

1800

Adams dies in Quincy, Massachusetts.

July 4, 1826

as a lawyer, Adams defended British soldiers who had killed five colonists in the Boston Massacre of 1770. This made him unpopular for a time among the other colonists. But Adams believed that everyone's legal rights should be protected.

In 1774 Massachusetts' colonists elected Adams to the Continental Congress. There he asked George Washington to serve as commander of the Continental Army, the military force of the colonies during the American Revolution. He also chose Thomas Jefferson to write the Declaration of Independence.

In 1779 Adams served at the Massachusetts Constitutional Convention. He wrote the document that became the state's constitution of 1780. Adams then joined Benjamin Franklin in Paris, France. There he helped to produce the Treaty of Paris, which ended the American Revolution.

Vice Presidency

In 1789 Adams finished second to George Washington in the presidential election. Under the system of the time, Adams became vice president. Voters reelected the two men in 1792.

Political parties began to form during Washington's presidency. Adams and Alexander Hamilton led the Federalists, who supported a strong central government. They opposed the Democratic-Republicans, led by Jefferson, who wanted the states to have more power.

Presidency

Adams won a narrow victory over Jefferson in the election of 1796. Adams was not a popular president. He followed his own principles instead of others' opinions. Adams even disagreed with other Federalists, notably Hamilton.

During Adams' presidency a dispute between the United States and France

Did You Know?

almost led to war. The French had expected the United States to support them in their war with Britain. The United States refused, and the French began seizing U.S. ships. Hamilton and others called for war with France. Adams, however, thought the United States was not ready for another war. Going against his party, he made peace with France.

Adams faced more criticism for the passage of the Alien and Sedition Acts in 1798. Those harsh laws made it more difficult for new immigrants to stay in the country. They also punished critics of the government.

Defeat and Death

Adams lost to Jefferson in the presidential election of 1800. Adams died within hours of Jefferson on July 4, 1826, the 50th anniversary of the signing of the Declaration of Independence.

Adams, John Quincy

Son of President John Adams, John Quincy Adams became the sixth president of the United States in 1825. Although he was intelligent and dedicated to his country, Adams was not very popular. His accomplishments as a diplomat and congressman overshadowed his uneventful presidency.

John Quincy Adams was the sixth president of the United States.

Early Life

John Quincy Adams was born on July 11, 1767, in Braintree (now Quincy), Massachusetts. He grew up during the American Revolution. His father was a member of the Continental Congress. His mother, Abigail Adams, also was a patriot. Adams studied in Europe and in Massachusetts at Harvard College. After graduating in 1787, he studied law and became a lawyer in Boston.

In 1797 Adams married Louisa Catherine Johnson. The couple had four children, a daughter and three sons. One of their sons, Charles Francis Adams, became a member of the House of Representatives and a diplomat.

Early Career

In 1794 President George Washington made Adams the U.S. minister to The

Netherlands. In 1797 Adams' father, now president, made Adams ambassador to Prussia. In 1802 Adams was elected to the Massachusetts Senate. In 1803 he was elected to the U.S. Senate. After five years he resigned from the Senate to practice law.

In 1809 President James Madison appointed Adams minister to Russia. In 1815 Adams became minister to Great Britain. He returned to the United States in 1817 and became secretary of state under President James Monroe. In that role Adams helped persuade Spain to give control of Florida to the United States. He also helped create the Monroe Doctrine, a warning to European countries not to extend their power in the Western Hemisphere.

Presidency

In 1824 Adams was one of four candidates for the presidency. Andrew Jackson received the most electoral votes, fol-

lowed by Adams. No one had a majority of the votes, however, so the House of Representatives had to pick the winner. The House chose Adams. He took office in 1825.

The country prospered during Adams' presidency, but he was not a successful leader. He wanted to create a national university and expand the country's roads. However, Jackson's supporters in Congress blocked most of Adams' bills. In the election of 1828 Adams lost to Jackson.

Later Career and Death

Adams retired in 1829, but his retirement was brief. In 1830 Massachusetts elected him to the House of Representatives. In Congress Adams argued against the expansion of slavery. He also helped start the Smithsonian Institution, which today runs several museums in Washington, D.C. Adams suffered a stroke in 1848 while speaking in the House. He

died in the Capitol two days later, on February 23, 1848.

Adams, Samuel

A strong attachment to the cause of independence made Samuel Adams a leader of the American Revolution. As a politician and as a writer he stirred the colonists against British rule.

Samuel Adams was born in Boston, Massachusetts, on September 27, 1722. His second cousin was John Adams, the second president of the United States. Sam graduated from Harvard College in 1740 and soon entered local politics.

In the 1760s Adams led protests against the British, who ruled the colonies at the time. He served in the Massachusetts legislature from 1765 to 1774. In 1772 he helped organize a “committee of cor-

Samuel Adams

respondence.” This was a group that coordinated anti-British activity.

Adams was among the first to call for complete independence for the American colonies. As a member of both Continental Congresses, he said that Americans must be ready to fight. In 1776 he signed the Declaration of Independence. In 1794 Adams was elected governor of Massachusetts. He died on October 2, 1803.

Adaptation

Plants and animals have special characteristics, or traits, that help them survive in their surroundings. They develop these traits through a process called adaptation.

Many animals have traits that help them hide from other animals that want to attack them. Some insects look like a leaf or a twig. Deer are colored shades of brown, like the trees in the forests where they live. In both cases, these animals become almost invisible to their predators, or attackers, because they blend in with their surroundings.

Other animals have features that help them deal with some part of their surroundings. Frogs, alligators, and hippos all spend a great deal of time in the water. They all have their eyes and nostrils near the top of the head. This

walrus

hippopotamus

duck

Many animals have developed features to help them survive in their habitat. Hippopotamuses' eyes and nostrils are on the top of the snout. This allows them to spend a lot of time almost completely underwater. Ducks have webbed feet to help them swim. Walruses have thick skin to protect against the cold.

means that the animal may remain almost completely underwater and yet be able to see and breathe. Water birds have webbed feet to help them paddle in the water. Cactus plants, which live in dry places, can store a lot of water. A cactus has thick skin and a waxy surface. This keeps the plant from losing water through evaporation.

Organisms with helpful traits tend to thrive, to reproduce, and to pass those traits on to their own offspring. Similar organisms that do not have these traits do not survive as well and do not have as much chance to reproduce. Therefore the helpful traits are passed on and eventually become permanent. This process is called natural selection. It is part of the process of evolution.

Addams, Jane

Jane Addams

The social worker Jane Addams devoted her life to helping the poor and promoting world peace. She founded Hull House to serve needy immigrants in Chicago, Illinois. It was one of the first agencies of its kind in North America.

Jane Addams was born on September 6, 1860, in Cedarville, Illinois. She gradu-

ated from college in 1882 and then went to Europe. In a poor section of London, England, she visited Toynbee Hall. University graduates lived there and worked to improve life in the neighborhood. It was known as the world's first social settlement. Addams took this idea back to the United States.

In 1889 Addams and a classmate, Ellen Gates Starr, rented a big house in Chicago. They moved in and opened the house to immigrants who were trying to succeed in their new country. Addams and Starr called their social settlement Hull House after its builder, Charles Hull. Hull House workers started a day care center, a kindergarten, a gymnasium, and an employment agency. They taught many kinds of classes and even set up a theater. All these programs eventually filled 13 buildings.

Addams became involved in many social causes. She worked to pass laws against child labor, to protect workers' rights, and to win women the right to vote. Addams believed that countries should settle their disagreements peacefully. She spoke out against World War I even though her opinion made her less popular. In 1931 she won a share of the Nobel peace prize.

Addams lived at Hull House until her death on May 21, 1935. The original Hull mansion has been preserved as a museum that honors her.

Addis Ababa

Population
(2006 estimate)
2,973,000

Addis Ababa is the capital and largest city of the East African country of Ethiopia. It is situated on a plateau high in the central mountains of Ethiopia.

Ethiopia's government ministries and houses of parliament are located in Addis Ababa. The city also contains the headquarters of the African Union.

Most of Ethiopia's trade passes through Addis Ababa. In the western part of the city is the Mercato. It is one of the largest open-air markets in Africa. Goods manufactured in the city include textiles, food, beverages, plastics, and wood products.

Addis Ababa became the capital of Ethiopia in the late 1800s. Before that

Worshippers gather at an Ethiopian Orthodox church in Addis Ababa.

the capital was Entoto, a cold, wind-swept town just to the north. In 1887 the empress Taitu persuaded her husband, Emperor Menelik II, to move the capital to its present site.

From 1935 to 1941 Italian forces occupied Addis Ababa as well as the rest of Ethiopia. The Italians paved roads and constructed European-style buildings. Development of the city was slow from 1941 until 1960. Beginning in the 1960s, however, Addis Ababa grew rapidly in population.

Adena Culture

The ancient Native Americans of the Adena culture lived in a large area centered in what is now southern Ohio. The Adena people thrived from about 500 BC to AD 100. They are known mostly for the earthen mounds they built. The term Adena comes from the name of a place where archaeologists found Adena mounds in the early 1900s.

The Adena settled in hundreds of small villages along the Ohio River. They lived in cone-shaped houses and fed themselves by hunting, fishing, and gathering fruits and wild plants. They made tools from wood, bone, and copper. They also wove cloth and molded simple pots from clay.

The Adena constructed hundreds of earthen mounds in the area that now

The largest burial mound of the Adena culture can be seen in what is now northern West Virginia. It was built more than 2,000 years ago.

makes up Ohio, Indiana, Kentucky, West Virginia, and Pennsylvania. Many of the mounds were burial sites. The Adena built many mounds in simple shapes such as circles and rectangles. They shaped other mounds like animals. The most famous is the Great Serpent Mound near Peebles, Ohio. This mound looks like a giant snake and is nearly 1,300 feet (400 meters) long.

No one knows for sure what happened to the Adena people after about AD 100. Some scientists think that they joined the Hopewell people, who developed a similar culture in the territory where the Adena had lived.

Adobe

Adobe is a type of clay that is used to make bricks. People in many dry parts

The buildings of Taos Pueblo in New Mexico are made of adobe. Some have been lived in for more than 1,000 years.

of the world use adobe bricks to build buildings. This is partly because there are few trees in these regions to supply wood for building.

People make adobe bricks by wetting clay and then adding straw or another type of fiber. They mix the material and pour it into molds. The molds have four sides and are open at the top. People then lay the bricks out in the sun to dry, which can take several weeks. When they are dry, the adobe bricks are ready to use.

Adobe buildings usually start with a base of stone or concrete. Workers stack the adobe bricks on this base. They stick the bricks together with a mudlike material called mortar. Adobe buildings are very strong and last for hundreds of years. Adobe buildings also stay warm in winter and cool in summer.

People have used adobe for thousands of years. Ancient peoples east of the Medi-

terranean Sea, in North Africa, and in southern Spain made adobe bricks. American Indians in the driest parts of North and South America also built with adobe. For example, the Pueblo Indians built many adobe houses in what is now the southwestern part of the United States.

Adolescence

Adolescence is the time in a young person's life between childhood and adulthood. Adolescence starts when a person is about 12 years old and ends at about the age of 19. A person in this age group is called an adolescent, or a teenager.

Adolescence is a time of great change. Adolescents experience changes in their bodies. They also experience changes in their emotions, or feelings, as well as their thoughts and beliefs. They often see the world differently, and they act differently than they did when they were children.

Relationships with their friends are very important to most adolescents.

Changes in the Body

During adolescence, the reproductive system develops. The reproductive organs are the parts of the body that allow men and women to make babies. Girls' and boys' bodies change in different ways. Boys grow facial hair, and their voices deepen. They also develop stronger muscles. Girls grow breasts and wider hips, and they start having menstrual periods. This means that they are able to become pregnant.

Emotional Changes

Adolescence is an exciting time. It is also a time that can be very confusing. Boys and girls become much more interested in each other. At the same time they may worry about their appearance, and they are sometimes easily embarrassed. During adolescence, most boys and girls care a lot about what other adolescents think of them. They may also be very concerned with how they fit into their world. Often adolescents choose to spend time with their friends rather than with their families.

Growing Independence

As adolescents grow emotionally, they begin to take on new responsibilities and gain new freedoms. They act and think more independently. They also start to find a balance between family and friends. These changes mean that adolescents are on their way to becoming adults.

Adriatic Sea

The Adriatic Sea separates Italy from the Balkan Peninsula of eastern Europe. It was probably named after the port town of Adria, which prospered during ancient Roman times.

The Adriatic is about 500 miles (800 kilometers) long and has an average width of 100 miles (160 kilometers). Its maximum depth is 4,100 feet (1,250 meters). The sea has a high salt content. The climate is Mediterranean. This means that it has clear, warm, and dry summers and mild, humid winters.

The Adriatic extends from the Gulf of Venice, in the north, southeastward to the Strait of Otranto, which leads to the Ionian Sea near Albania. Its western, or Italian, coast is low and straight. The eastern coast is rocky and mountainous. The countries of Slovenia, Croatia, Bosnia and Herzegovina, and Montenegro border the sea to the east.

The Adriatic is an important part of tourism in the region. Many holiday

Did You Know?

resorts are located on its shores. The fishing catch on the Adriatic includes lobsters, sardines, and tuna.

Advertising

Whenever people give information to the public about an event, a product, or a service, they are using advertising. A piece of advertising is called an advertisement, or ad.

The goal of most advertising is to make the public want to buy whatever is being advertised. People also use advertising to make the public form opinions about things. For example, an ad could try to make the public believe that a company treats its workers well. Another ad could try to make voters choose a certain candidate for president.

Ads appear almost everywhere. They are found in newspapers and magazines. They appear on television, radio, and

the Internet. Ads are also posted as signs in all kinds of public places.

The Media and Advertising

When advertisers want many people to see or hear their ads, they pay the media to have the ads published or broadcast. Newspapers and magazines publish, or print, ads between their articles. Television and radio networks broadcast, or play, ads during their programs. (Television and radio ads are also called commercials.) Web sites, buses, movie theaters, and many other places also display ads in exchange for money.

Control of Advertising

Advertisers are regulated, or controlled, in several ways. Governments usually pass laws to make sure that ads are truthful and do not offend consumers. Also, the media usually set their own rules that advertisers must follow.

History of Advertising

Signs were the first form of advertising. Even thousands of years ago people created hand-lettered signs to advertise their goods and services. The invention of the printing press in the 1400s expanded this type of advertising. Merchants could print dozens of the same posters and fliers to advertise what they were selling. In the 1600s and 1700s newspapers appeared in Europe, the Americas, and Japan. Advertising then became even more widespread.

Today advertising is a huge part of business around the world. A major corpora-

Bright advertisements compete for attention in New York City.

tion may spend hundreds of millions of dollars a year just on advertising.

Aegean Civilization

The earliest European civilization arose sometime after 3000 BC, in the region of the Aegean Sea. It took place on the islands and the mainland of what is now the country of Greece. This civilization went through several stages. It began on the island of Crete. That early part is now called the Minoan civilization. On the mainland of Greece it developed later. That is now called Mycenaean civilization.

Minoans

The Minoan civilization lasted from about 2500 BC to about 1400 BC. The Minoans are named for their legendary

king Minos. Their capital city was Knossos. The palace at Knossos was enormous, covering 5.5 acres (2.2 hectares) of ground. Large towns spread around other Minoan palaces. Houses were often two stories high. They were built with stones, timber, and mud bricks.

The Minoans painted their pottery and walls with images of plants, flowers, animals, and goddesses. They worshipped a mother goddess.

The wealth of the Minoans was based on seafaring and trading, especially trade with the Middle East and Egypt. Pottery made on Crete has been found in Egypt, and ancient Egyptian pottery has been found on Crete. A powerful navy protected Knossos.

Mycenaeans

The Mycenaean civilization developed in the 1500s BC, when Greek-speaking people settled down on the Greek mainland. The Mycenaeans conquered the Minoans in about 1400 BC. Their civilization is named after Mycenae, its most important city.

A king headed the society. Kings built fortresses with strong walls. This was because the Mycenaeans fought many wars, including—according to legend—the Trojan War. There were also landowners, farmers, slaves, and priests. Like the Minoans, the Mycenaeans decorated their walls with paintings. They were skilled jewelers and goldsmiths.

Mycenaean trade extended to Sicily, Egypt, Palestine, Troy, Cyprus, and

Did You Know?

Ancient Greek mythology tells of the Minotaur, a fierce monster of the Minoan kingdom. The Minotaur had the body of a man and the head of a bull.

The throne room of the palace in Knossos still holds the throne of the ancient Minoan kings.

Macedonia. The Mycenaeans imported food, cloth, and copper. They probably exported woolen goods, olive oil, timber, and silver.

The Mycenaeans adopted the Minoan system of writing on clay tablets. Unlike the Minoan language, however, the Mycenaean language has been translated. It is the oldest known form of Greek.

Toward the end of the 1200s BC, the Mycenaean civilization fell apart. Many people moved away to other lands. Scholars think that the decline may have been due to drought, bad harvests, lack of food, disease, or anger about the high taxes the people had to pay.

In about 1100 BC Greece was taken over by tribes from the north. These peoples were the ancestors of the modern Greeks. It is with them that the history of ancient Greece began.

Aegean Sea

An arm of the Mediterranean Sea, the Aegean Sea lies between the countries of Greece and Turkey. The region was the site of two great ancient civilizations, those of Crete and Greece.

The Aegean Sea is about 380 miles (610 kilometers) long and 185 miles (300 kilometers) wide. In the northeast it connects to the Black Sea through a series of narrow straits. The sea has hundreds of islands stretching from Greece

to the shores of Asia. The islands are actually the mountain peaks of an underwater landmass called Aegeis.

The Aegean contains few nutrients so very little plant life grows there. Its warm waters, however, encourage fish to enter it from the Black Sea to breed.

The chief products of the islands are wheat, wine, oil, figs, raisins, honey, vegetables, marble, and minerals. Fishing and tourism are also important. Visitors come to see the villages of whitewashed houses as well as the ruins of ancient civilizations.

The clear blue waters of the Aegean Sea lap at the shores of a beach in Greece.

Scientists believe that people began to explore the Aegean about 15,000 years ago. By the 1st century BC the Roman Empire ruled over the area of the Aegean and the Mediterranean. The region later came under the control of the Byzantine Empire, the Ottoman Empire, and finally the independent country of Greece.

Aesop

Hundreds of stories called fables are credited to a person named Aesop. Ancient scholars claimed that Aesop lived in the kingdom of Thrace in the 500s BC. It is now known that many of the stories are even older and that Aesop probably never existed. But the fables that are credited to him are still used to teach children.

The fables of Aesop were probably part of an oral history—stories that were told aloud. About 2,000 years ago the Roman writer Phaedrus wrote down some of the fables. Later the stories were translated into other languages. An early English-language version of the stories was published in 1692. The fables familiar to readers today were translated into English during the 1800s. Most of the fables are about animals with human characteristics. Most end with a moral, or a statement of the lesson that the fable teaches.

Fable • Folktale

In Aesop's fable of "The Hare and the Tortoise," a speedy hare teases a tortoise about his slow pace. The tortoise challenges the hare to a race. The hare is so sure that he will win that he takes a nap. When he wakes up, the tortoise has already won. The moral is "Slow but steady wins the race."

Afghanistan

The country of Afghanistan lies at the heart of central Asia. The capital is Kabul.

Geography

Afghanistan borders Iran, Pakistan, Turkmenistan, Uzbekistan, and Tajikistan. The Amu Darya river forms part of the northern border. A narrow piece of land called the Vakhn, or Wakhan Corridor, connects Afghanistan with China.

Afghanistan is a mountainous country. The main range is the Hindu Kush, in the northeast. North of the central mountains are fertile plains. Deserts, including the sandy Rigestan, lie in the southwest. Afghanistan generally has a dry climate with cold winters and hot summers.

Plants and Animals

Southern Afghanistan has little vegetation. Cedar, oak, walnut, alder, and ash

trees grow in the north. The mountains have forests of pine and fir.

Wolves, foxes, hyenas, jackals, bears, and wild goats roam the mountains.

Gazelles, wild dogs, and wild cats are widespread. The country's birds include vultures and eagles.

People

The people of Afghanistan, known as Afghans, are a mixture of many different groups. The Pashtuns make up about half of the population. Tajiks make up about a fifth of the population. Other ethnic groups include the Hazara, Uzbeks, Chahar Aimaks, and Turkmen. Pashto, the language of the Pashtuns, and Dari (Persian) are the two official languages, but others are spoken. Almost all Afghans are Muslims.

Kabul is the largest city, but most Afghans live in rural areas. Farmers live in villages along the rivers. Nomads live in tents and move from place to place. Few people live in the mountains or the deserts.

Economy

Afghanistan is one of the poorest countries in the world. Most people grow crops and raise animals for their own use. The main food crops are wheat, rice, grapes, barley, and corn. Sheep, goats, and cattle are the main livestock. Some farmers grow opium poppies, which are used to make illegal drugs.

The blue-tiled mosque in Mazar-e Sharif, Afghanistan, is important to all Muslims. It marks the tomb of 'Ali, the son-in-law of the prophet Muhammad.

Manufacturers make processed foods, leather, fur, and textiles. The country has deposits of natural gas, but warfare has prevented Afghans from using them.

History

Major trade routes crossed what is now Afghanistan thousands of years ago. The Persians and Macedonian king Alexander the Great ruled the land more than 2,300 years ago. In the AD 600s Arab invaders introduced the religion of Islam. In 1219 Genghis Khan made the area part of his Mongol Empire. Beginning in the 1300s Turkic peoples, the Mughal Empire, and the Persians ruled parts of the land.

Ahmad Shah Durrani, a Pashtun leader, unified Afghanistan under his rule in 1747. Great Britain invaded in the

1800s. After winning independence from Britain in 1919, Afghanistan continued as a monarchy. In 1973 Afghans overthrew the king. The country's new leaders made Afghanistan a republic, led by a prime minister.

Soviet Invasion

In 1978 Communists seized control of Afghanistan's government. The Soviet Union invaded in December 1979. For nearly a decade Islamic forces known as mujahideen fought the Soviets. Millions of Afghans left the country for Pakistan and Iran. The Soviet Army left in 1989.

The Taliban

Various Afghan groups then fought for control. By the late 1990s a group called the Taliban had gained control over most of Afghanistan. The Taliban ruled according to a strict version of Islamic law.

The Taliban angered other countries by allowing terrorists to live in Afghanistan. When the Taliban refused to hand over suspected terrorist Osama bin Laden, the United States and its allies bombed Afghanistan in October 2001. Within months the Taliban abandoned Kabul. In 2004 Afghanistan adopted a new constitution and elected a president. But fighting continued between U.S. forces and the Taliban.

Africa

Africa is the world's second largest continent. More than 50 countries make up the continent. More than one eighth of the world's population lives there.

Land and Climate

Africa's landscape is varied. The northern and western parts of the continent are generally lower and more level than the eastern and southern areas. Africa is the oldest continent. Therefore most of its mountains are not as high as those on other continents. They have been worn down over millions of years by wind and water.

Africa's most striking feature is a series of great rifts, or troughs, in the east known as the Rift Valley system. These rifts span two continents, from western

Asia through eastern Africa. In Africa they are deep, long, narrow valleys.

The world's longest river, the Nile, flows through northern Africa. The continent's other long rivers include the Congo in central Africa, the Niger in the west, and the Zambezi in the south. Eastern Africa has a chain of lakes known as the great lakes.

The continent is crossed midway by the equator. This means that most of Africa—the middle portion—lies within the tropics, an area where it is hot year-round. In the lowlands near the equator, rain falls throughout the year. To the north and south of this rainy area are large regions that have a rainy season followed by a dry season. It is very hot

A pair of giraffes is at home near Mount Kilimanjaro in Tanzania.

and dry year-round in Africa's major deserts—the Sahara in the north and the Kalahari and the Namib in the south.

Plants and Animals

The vegetation growing in each region depends on the rainfall it receives. Near the equator, where it rains year-round, there are dense rain forests. These forests contain thousands of different types of trees and other plants. Between the rain forests and the great deserts to the north and south are the savannas. These are open grasslands scattered with trees such as acacias and baobabs. Few plants grow in the deserts.

A serious problem in the savanna is that the vegetation is being used up, leaving the land bare. As the population increases, more and more of the trees are being used for fuel and for building supplies. Some scientists are concerned that removing the vegetation may cause the savanna to become more desertlike.

Africa has many different kinds of animals, though their numbers were greatly reduced in the 1900s. This loss occurred because of overhunting and because large areas of their natural habitats were taken over for farming. Today many species are threatened with extinction. Several countries have set aside land to help protect wild animals. These wildlife preserves are home to such animals as elephants, giraffes, zebras, hippopotamuses, antelopes, lions, jackals, and hyenas. The rain forests support monkeys, bats, flying squirrels, gorillas, leopards, and mongooses. The native animals of northern Africa include types

of wild sheep and goat, the African red deer, and the jerboa (a small leaping animal like a gerbil). Fish, birds, and reptiles also are abundant.

People

Africa has the most physically varied population in the world. Most of the population consists of black peoples belonging to almost 3,000 different ethnic groups. In the north there are also large numbers of Arabs. Mainly in the south there are some descendants of Europeans who established colonies in Africa hundreds of years ago.

The number of languages spoken in Africa probably exceeds 1,000, though some are spoken by only a small number of people. Arabic is the major language of northern Africa. Most Africans who live south of the equator speak one of the many Bantu languages. In general, Islam is the religion of northern Africa

South African boys pose in front of a painting in Cape Town, South Africa.

and Christianity of southern Africa. Traditional religions are also practiced.

Many African countries are comparatively poor. In all African countries the government provides public education. But most governments cannot afford to provide education for everyone. Millions of Africans remain unable to read or write. Much of the money for health care comes from other countries. Infectious diseases, such as malaria, continue to be a serious problem in Africa, and about 70 percent of all AIDS cases are in Africa.

Economy

Most of Africa is underdeveloped. But the continent has some of the world's largest shares of minerals, including oil, natural gas, and coal; metals such as gold; and gems such as diamonds.

Farming is a very important part of the African economy. The chief food crops vary by region. They include yams in the tropical forests of the west; corn, millet, and rice in the savannas; and corn in the south. The tropical grasslands are also suitable for cattle farming. Most African countries do not produce enough food to feed all their people. Therefore they must import food.

In many parts of Africa certain crops are produced for sale to other countries. Africa is the world's largest supplier of cocoa beans, which are used in making chocolate. Africa also exports much cotton, sisal (a fiber), tea, coffee, palm oil, yams, and peanuts, as well as wood from the forests.

Although Africa still earns most of its money by exporting raw materials and food, many of its countries are developing industries. Some industries process raw materials produced in local farms and forests. Others manufacture goods for use in Africa. South Africa is the most industrialized African country.

History

Africa is thought to be the place where humans first developed, more than 1 million years ago. The African continent had many kingdoms and empires during its early history. One of the world's earliest civilizations, ancient Egypt, devel-

Ruins of a casbah, or fort, stand in Morocco in North Africa.

oped in the lower Nile River valley nearly 5,000 years ago.

The region called Nubia was south of Egypt. The powerful Nubian kingdom called Kush ruled Egypt for a while in the 700s and 600s BC. In the AD 300s the kingdom of Aksum conquered Kush from the south.

The African people have a long history of contact with other powers. In about the 700s BC the Phoenicians established the city of Carthage in what is now Tunisia. In the 100s BC the Roman Empire took control of part of North Africa. Arabs from the Middle East spread into Africa in the AD 600s. Great trading states, including the Ghana, Mali, and Songhai empires, flourished in western Africa. In eastern and central Africa, powerful city-states such as Mogadishu and Mombasa traded with Arabia.

The first Europeans to arrive in Africa were the Portuguese, in the late 1400s. Soon the British, the Dutch, and the

French had also set up towns and trading centers. They traded slaves from Africa to the Americas from the 1500s to the early 1800s. The Europeans did not actually take control of the African territories they entered during this period, however.

Starting in the late 1800s Britain, France, Belgium, Portugal, and Germany ruled most of Africa as colonies. The Europeans took raw materials such as minerals and timber from their colonies and shipped them back to Europe. The African people had no say in how they were ruled. They were also often forced off the best land so that the Europeans could take it. Many African people resisted European control throughout the colonial period.

In the 1900s the colonies were finally granted independence. Many African countries faced great unrest after gaining independence. Ethnic violence led to many deaths, and in many cases civil war broke out as individuals and groups struggled to establish control. The poor economies of the countries added to the problems. In 2002 African countries formed an organization called the African Union to try to solve these problems. International agencies such as the United Nations helped, too.

African Americans

African Americans are people in the United States who have ancestors from Africa. Many African Americans have non-African ancestors as well. African Americans are also known as black Americans.

Slavery

Most African Americans have ancestors who were slaves. Slaves were people taken from their African homelands and shipped to the Americas. There, white people forced them to work without pay and in harsh conditions. English settlers brought the first African slaves to the colony of Virginia in the early 1600s. By 1790 black people made up nearly one fifth of the population of the United States. Most slaves lived and worked on plantations, or large farms, in the South.

Many people called abolitionists worked to end slavery. These included black people as well as white people. Harriet Tubman, a black abolitionist, organized the Underground Railroad, which was a way for slaves to escape to the North.

The American Civil War

The American Civil War broke out in 1861. This was a war between the Northern and Southern states, partly over the issue of slavery. In 1863 President Abraham Lincoln issued the Emancipation Proclamation. This document freed the slaves in the Southern states.

The North won the Civil War in 1865. That year the 13th Amendment to the U.S. Constitution ended slavery throughout the United States. In 1868 the 14th Amendment gave African Americans U.S. citizenship. In 1870 the 15th Amendment guaranteed them the right to vote.

Reconstruction

The period following the war was known as Reconstruction. African Americans were finally free, but most of them lived in terrible poverty. In the South many worked as sharecroppers. This meant that they farmed a piece of land owned by someone else. Their pay was a share of the crops they produced.

In addition, African Americans continued to suffer from discrimination (unfair treatment) and violence. Schools and other public places were often segregated. This meant that blacks and whites could not mix in those places. Violent groups like the Ku Klux Klan kept most blacks from voting in the South. These groups also hurt or killed many blacks.

First Civil Rights Efforts

In the late 1800s a former slave named Booker T. Washington became a powerful voice for African Americans. He believed in training African Americans to do certain jobs so that they could find work.

Other African American leaders disagreed with Washington. W.E.B. Du Bois thought that the government should guarantee to blacks the same rights that whites had. These

Did You Know?

February is Black History Month in the United States. In that month schools and other organizations help everyone learn about the African American experience.

rights—such as the right to vote or the right to go to a public school—are called civil rights. Du Bois and others formed the National Association for the Advancement of Colored People (NAACP) to help African Americans to gain full civil rights.

Great Migration

During World War I (1914–18) large numbers of African Americans began to leave the South. They moved to cities in the North and West. There they hoped to find jobs and to escape discrimination. However, many were forced to live in poor, segregated areas.

This movement from the South, called the Great Migration, continued through the 1960s. By 1970 about 6 million African Americans had left the South.

Civil Rights Movement

By the 1950s the NAACP had begun to use the court system to fight for civil rights for African Americans. One major success came in 1954. In that year the U.S. Supreme Court outlawed segregation in public schools.

These efforts soon turned into an organized fight for equal rights. This was called the civil rights movement. A Baptist minister named Martin Luther King, Jr., became the leader of the movement. In 1963 he led a major protest called the March on Washington.

In 1964 the U.S. Congress passed the Civil Rights Act. This law banned discrimination based on race in schools, jobs, and many other areas.

In May 1954 the U.S. Supreme Court ruled that segregation in schools was illegal. Lawyers George Hayes (left), Thurgood Marshall (center), and James M. Nabrit (right) join hands outside the U.S. Supreme Court to celebrate the decision.

Black Power Movement

Despite these successes, some African Americans grew impatient with the slow pace of change. They began a

African Americans at the 1968 Olympics show their support of the black power movement with a raised-fist salute.

more extreme movement called the black power movement. Malcolm X and a group called the Black Panthers were among the movement's leaders. They believed that blacks should use violence, if necessary, to get power and justice.

During the 1960s violent riots did break out in black neighborhoods in many cities. The African Americans who rioted were angry about violent treatment by police, a lack of jobs, and poor housing.

Political Progress

After the 1960s the civil rights movement broke into many separate groups. Still, African American leaders continued their work to end discrimination.

In addition, many African Americans gained positions of power. In 1967 Thurgood Marshall became the first African American justice of the U.S. Supreme Court. In 2001 Colin Powell became the first black U.S. secretary of state, and in 2008 Barack Obama became the first African American to be elected president of the United States.

African Americans Today

In 2000 there were about 36 million Americans with African roots. They made up about 13 percent of the total U.S. population. One quarter of African Americans lived in poverty, and discrimination against African Americans remains a problem today. Nevertheless, African Americans have made great

African National Congress

A political party in South Africa, the African National Congress (ANC) supported the rights of black and mixed-race people through the apartheid era. Nelson Mandela, the first black president of South Africa, belonged to the ANC.

In the early 1900s whites ruled South Africa. Blacks made up most of the

Thabo Mbeki stands in front of a board showing election results. Mbeki followed Nelson Mandela as leader of the ANC.

country's population but did not have equal rights. In 1912 black Africans who wanted equality formed the party that became the ANC.

In 1950 the South African government introduced apartheid. This system kept whites and nonwhites apart and denied nonwhites almost all their legal rights. The ANC protested. In 1960 the party was banned, but its members continued to protest, sometimes violently. The government arrested ANC leaders, including Mandela. In 1964 Mandela was sent to prison.

During the 1970s and 1980s the ANC gained support among South Africa's people. In 1990 the government lifted the ban on the party and freed Mandela. In 1994 an election open to all races was held. The ANC won control of the legis-

lature, and Mandela became South Africa's first black president.

African Union

People carry pictures of African leaders at a ceremony celebrating the first meeting of the African Union.

In 2002, 53 African countries joined together to form the African Union (AU). The leaders of these countries felt that the union would benefit all the countries' people, governments, and businesses. The headquarters of the AU is in Addis Ababa, Ethiopia.

The AU took the place of the Organization of African Unity (OAU). The OAU had been formed in 1963. Around that time Africa was undergoing great changes. Colonies that had been under the control of European powers were

becoming independent countries. The new countries faced many challenges. The countries set up the OAU so that they could help each other.

African leaders formed the AU to improve what the OAU had been doing. One of the AU's goals is to promote unity, or togetherness, between African countries. Other goals are to defend the member countries and to encourage economic development. The AU also works for peace and stability, the end of hunger, and the protection of human rights.

The leaders of the AU hope to bring all of Africa under a single, central government someday. The AU already has its own parliament, or lawmaking body. The leaders are also planning a court system for all of Africa. In addition, they want the countries of the AU to use a single form of money.

Aging

All living things, from their first moment of existence, begin the process of aging, or growing older. As children move toward adulthood, they become taller, stronger, and more independent. At some point in adulthood, however, a slow decline begins. The onset of aging happens at different times for different people. Most people start to feel some effects of aging in their 40s or 50s.

As people age, their hair often thins and turns gray, and their skin wrinkles. Their

People of all ages can enjoy spending time together.

muscles begin to shrink and their bones become more fragile. They often lose some of their height or part of their vision or hearing. They think more slowly, and their short-term memory may suffer. Scientists are not exactly sure what causes the effects of aging. The cells of the body might have a built-in time limit. That limit would determine how long the cells can remain healthy and able to create new cells.

Several factors affect how long people live. One factor is heredity. Long lives seem to run in families. Another factor is lifestyle. Physically fit people who do not smoke will probably age more slowly and live longer than others. Poverty also affects how long people live. People who cannot afford to eat well and go to a doctor when they are sick may die before they become old.

Animals age at different rates and live for different lengths of time. These aging

rates depend on the type of animal. Rats may be said to be old at about 2 years, dogs at about 10 years, and elephants at about 40 years. For humans, people in their 60s and older are commonly considered to be old.

Agriculture

Agriculture is another word for farming. It includes both growing and harvesting crops and raising animals, or livestock. Agriculture provides the food and many of the raw materials that humans need to survive.

Raising Plants and Animals

The products of agriculture that people eat come from both plants and animals. Plant foods include fruits, vegetables, and grains. Meat, dairy (milk) products, and eggs are some of the most common animal foods.

Plants and animals also supply such natural materials as cotton, flax, wool, and hides. Workers process these materials into thread, cloth, and leather. Then people use the materials to make such

things as clothing, draperies, shoes, furniture coverings, and many other items.

Growing trees is another important agricultural job. Lumber from tree farms is used to make buildings, furniture, boats, and many other things. Christmas trees often come from tree farms, too.

Location and Weather

People practice agriculture on farms, on ranches, and in orchards all over the world. Farmers raise crops and livestock in every climate and in all kinds of different soil. Some regions receive a lot of sunlight or rainfall. Others have colder or drier weather. All places have their own kinds of agriculture.

Plants and livestock need air, water, and nourishment to stay alive. If a plant does not have the kind of soil it needs, it may die. Similarly, animals also need to have the right climate and the right food to survive. Farmers try to raise the kinds of livestock and plants that will do well in their region. If they do not have perfect natural conditions, they try to create the best conditions possible. For example, many farmers in dry areas use irrigation, or artificial watering.

History

Humans may have begun taming animals and growing small crops as early as 10,000 years ago. However, many early people were nomads, or wanderers who moved from place to place. They found their foods in the wild as they traveled. They hunted, fished, and gathered nuts, berries, and roots.

An ox helps a man plant rice in Vietnam.

Some farmers use special irrigation systems to water their crops.

Eventually people learned to keep some animals in herds. They stopped roaming and began to settle in one place for longer times. They built homes and started to grow their own crops on the land around them. The crops provided a more dependable food supply than hunting and gathering. Small settlements grew into villages, towns, and cities.

About 200 years ago the Industrial Revolution brought great changes to agriculture. In the past people had used hand tools and animals to help them plant and harvest. Machines invented during the Industrial Revolution made that work easier. As a result, not as many workers were needed on farms. Many people moved away from farms to cities in search of jobs.

Today most agriculture takes place far outside big cities. Huge companies control much of the world's farmland. Crops grow on large plots of land with the help of irrigation and special chemicals. Farmers raise healthy livestock with the help of medicine. In poor countries,

however, many people still depend on their own small farms to survive.

AIDS

AIDS is a serious disease. The name stands for acquired immunodeficiency syndrome. Millions of people have died from AIDS since the 1980s. Scientists have not yet found a cure, but they can treat the disease effectively.

Causes

Tiny particles called viruses cause many diseases. The particular virus that causes AIDS is called human immunodeficiency virus (HIV). HIV enters the body through contact with infected blood or other body fluids. Coughing, sneezing, and handshaking do not spread the virus.

HIV kills helper T cells in the body. Helper T cells are a type of white blood

The AIDS Memorial Quilt is displayed in Washington, D.C. The quilt honors people who have died of the disease.

cell. They are part of the body's immune system, which fights off disease. The body loses its ability to fight off disease when its helper T cells die.

Symptoms

A new HIV infection often causes symptoms, or signs, that are similar to those of influenza (flu). They usually last only a week or two. After they clear up, an infected person may show no signs of illness for years. However, such a person can still pass the virus to other people.

Because of their weak immune systems, most HIV-infected people eventually come down with other infections. A person who has these infections is said to have AIDS.

The most common infections include tuberculosis and a certain type of pneumonia. People with AIDS also frequently develop a cancer called Kaposi sarcoma. The AIDS virus may also attack the nervous system and cause brain and eye damage. Death often follows.

Prevention and Treatment

People can prevent HIV infection. The main way to do this is to keep out of contact with possibly infected blood or body fluids.

If a person is infected, certain drugs can stop HIV from doing damage. Drug treatment has added years to the lives of many people with HIV infections.

Ailey, Alvin

Members of the Alvin Ailey American Dance Theater rehearse a scene from the dance called *Revelations*.

Alvin Ailey was a famous modern dancer. He was also a highly respected choreographer—a person who creates dances and directs dancers. His dance company toured around the world, bringing recognition to African Americans in dance.

Ailey was born in Rogers, Texas, on January 5, 1931. His family moved to Los Angeles when he was 12. Ailey began to study modern dance at the Lester Horton Dance Theater in 1949. He became the company's director and choreographer in 1953.

In 1954 Ailey moved to New York City, where he studied with modern dance pioneer Martha Graham and others. He created the Alvin Ailey American Dance Theater in 1958. The troupe performed many kinds of works, but Ailey particularly wanted to bring African American culture to modern dance.

Did You Know?

AIDS exists everywhere in the world. However, the disease is a particularly big problem in parts of Africa.

In 1958 Ailey achieved his first big success as a choreographer with *Blues Suite*. One of his most famous dances is *Revelations* (1960), which is set to African American spirituals. His works combine ballet and modern dance.

In 1965 Ailey retired from dancing, but he continued choreographing. He died in New York City on December 1, 1989. His company remained in operation after his death.

Air

All living things need air to breathe. Animals and plants would die without it. Air also holds airplanes and kites above the ground, and it is used to inflate tires and balloons. Air surrounds Earth as the atmosphere. Air has no color, taste, or odor. Although air is invisible, people can hear air when the wind howls. And they can feel air brush against their skin when the wind blows.

Air consists of a mixture of gases. These gases consist of tiny particles called molecules. They are so small that they cannot be seen. Molecules are combinations of different chemical elements. In air the most common of these elements are nitrogen and oxygen. Oxygen is an important component of air because humans and other animals need it to survive. In addition to nitrogen and oxygen, air consists of small amounts of the gases argon, neon, helium, and methane. Besides gases, air also contains

A kite takes flight on a windy day.

water vapor, dust, pollen, and bacteria. The water vapor in air is the source of rain and snow.

The oxygen in air comes from plants. Through a process called respiration, or breathing, humans and other animals take in oxygen and force out carbon dioxide. Carbon dioxide is a molecule made of oxygen and carbon. Plants take in the carbon dioxide and use it to make food. This is part of the process known as photosynthesis. Plants break down the molecule, use the carbon, and then release the oxygen into the air. In this way the carbon dioxide and oxygen in the air are constantly used and replaced.

Air Force

An air force is the part of a country's military that conducts warfare in the skies. Its pilots fly airplanes and other aircraft armed with weapons. They use these aircraft to attack enemy aircraft as

U.S. Air Force planes called F-16 Fighting Falcons fly in formation.

well as targets on the ground and in the water, mostly during wars.

An air force is usually one of several branches of a country's military. In the United States the other major branches are the Army and the Navy (which includes the Marine Corps).

Basic Functions and Aircraft

Most air forces perform a variety of military functions, or jobs. During wars an air force uses aircraft to observe the enemy's activities. It also gathers information about possible battlefields and targets.

Another basic job of an air force is to gain control of the air over a particular area. To do this, it uses aircraft called fighters to drive away or destroy enemy aircraft. Fighters are jet airplanes designed to fly very fast. They can also change direction quickly. Fighters carry missiles, machine guns, or other weapons on board.

An air force also uses aircraft to drop bombs. It often uses large aircraft called bombers to bomb targets in an enemy's country. It uses attack aircraft to help its country's troops fighting on the ground. Pilots fly attack aircraft close to the ground while bombing or shooting at enemy troops below. Attack aircraft are smaller and lighter than bombers.

Another duty of an air force is to move troops and military supplies from place to place. It normally uses helicopters or large transport planes to do this.

History

Inventors created the first successful airplanes in the early 1900s. Several European countries used fighter aircraft and bombers during World War I, from 1914 to 1918. Air warfare was a major part of World War II in the 1940s.

Air forces have used many new inventions to improve their aircraft and weapons over the years. For example, the jet engine was invented in the middle of the 1900s. This allowed planes to fly much faster. Computer technology has also helped in many ways. It has made it possible to bomb faraway targets with great accuracy. Computers are also used to help train pilots to fly airplanes and to keep airplanes on course.

Airplane

Humans have always envied birds for their ability to fly. In the 1700s and

Did You Know?

The United Kingdom's Royal Air Force was formed in 1918. It was the world's first air force.

Modern passenger airplanes can carry hundreds of people to almost anywhere in the world.

1800s humans flew in lighter-than-air ships such as balloons, but not until 1903 did people build the first heavier-than-air craft—the airplane.

The term airplane, which is often shortened to plane, usually refers to any type of power-driven aircraft that has fixed wings and is heavier than air. An airplane moves through the air with the help of its engine and wings. The wings are shaped in a particular way so that air flows over them and gives them lift. By contrast, balloons and airships are lifted by gases that are lighter than air. Helicopters are lifted by spinning blades.

Types of Airplanes

Airplanes can be grouped into many different categories. One way of classifying them is by the number of wings they have. Many early airplanes were biplanes, meaning that they had two pairs of wings, one above the other. Triplanes were also built in the early days of aviation. Today most airplanes are monoplanes, with one pair of wings.

Most airplanes take off and land from dry land, but some operate on water. Seaplanes have special landing gear that supports them in the water.

Airplanes can also be grouped by their purpose. Airplanes used for military purposes by the armed forces include fighters, bombers, spy planes, troop transports, and tankers that refuel other military planes while in flight. The familiar airliners that carry large numbers of people from city to city are called civil, or commercial, aircraft. Other kinds of

Seaplanes have special landing gear that allow them to take off from and land on the water.

civil aircraft carry cargo. Still others are flown by their owners as a hobby.

Parts of an Airplane

To understand how an airplane can fly, it is first necessary to know its different parts. The major parts are the airframe, the power system, and the flight controls and instruments.

Airframe

The airframe includes the fuselage, wings, tail, and landing gear. The fuselage is the body of the aircraft. It consists

of a rigid frame and a covering of aluminum, magnesium, or molded plastic or fiberglass.

The wings of an airplane have several moving parts. Flaps and slats are hinged parts that the pilot adjusts to increase the size of the wing surface. This changes the amount of force made by the wing. Ailerons are hinged parts that the pilot moves to turn the airplane.

The rear of the plane is called the tail. The horizontal stabilizer is a part of the

Modern Passenger Jet

tail that often looks like a small wing. It prevents the plane from pitching, or bucking up and down. The elevator is hinged to the horizontal stabilizer. It raises or lowers the nose, or front end, of the plane. The vertical stabilizer often looks like a fin. It prevents the aircraft from yawing, or swinging from side to side. The rudder is connected to the vertical stabilizer. It controls side-to-side movement.

The landing gear consists of rubber tires and shock-absorbing devices. Most planes have two main wheels or sets of wheels and another wheel to support the

tail. Some planes have wheels that fold up when the plane is in the air.

Power System

A plane's power system includes one or more engines and sometimes propellers. The two main types of engines are reciprocating engines and jet engines. A

A plane with turboprop engine uses both jet power and propellers. Turboprop engines are used only in small planes.

reciprocating, or piston, engine turns a propeller. The turning of the propeller provides most of the power to move the plane forward. Reciprocating engines are usually found on smaller airplanes. A jet engine moves a plane forward by shooting exhaust gases out the back. Jet engines are common on large commercial planes and military aircraft. Some small planes have a turboprop engine, which is a jet engine that turns a propeller.

Flight Controls and Instruments

Flight controls help a pilot to regulate the movement and position of an airplane. The control wheel or stick is used to adjust the elevator and the ailerons. Foot pedals allow the pilot to control the rudder. A throttle controls the engine power. The pilot also controls the wing flaps and slats.

Flight instruments are used for navigation, checking engine performance, and monitoring other equipment. In addition to these instruments, there are a

variety of indicators that monitor the engines and other parts of the plane's mechanical and electrical systems.

How Airplanes Fly

The science of flight is called aerodynamics. Four main aerodynamic forces act on an airplane in flight. They are called drag, thrust, gravity (or weight), and lift.

As a plane flies, the air slows it down. This is the effect of drag. To overcome drag a plane needs the forward-moving force of thrust. Thrust is produced by the plane's engines or propellers.

An airplane is heavier than air. It will fall to the ground under the influence of gravity unless lift is applied. The plane's wings are able to produce the necessary lift because of their shape. The upper surface is curved, while the lower surface is flat. To get past the curved surface, the air that flows over the wing has to go farther—and therefore faster—than the air that flows under it. This creates a difference in air pressure between the upper and lower surfaces as the plane moves forward. The air underneath is under greater pressure and therefore pushes the wing up. The faster the air flows past the wings, the greater the lift. For this reason, an airplane takes off most easily when it faces the wind.

Pilots use flaps and slats to change the amount of lift. Lowering the flaps increases the curved surface of the wing, which provides more lift for takeoff. Slats also increase lift by allowing air to flow more smoothly over the wing. Rais-

ing the flaps reduces lift, which slows down the plane for landing.

History

Before humans took to the air in airplanes, they flew in lighter-than-air craft. In 1783 the Montgolfier brothers of France made the first balloon that could carry people high into the air. Their balloon rose because they filled it with hot air, which is lighter than unheated air.

The 1800s saw much experimentation in both lighter-than-air and heavier-than-air craft. Several people worked with gliders to establish the principles of airplane design. Gliders are similar to airplanes but they have no motor. Once they are launched, they move through the air as a plane does.

Early Aviation

On December 17, 1903, in Kitty Hawk, North Carolina, Orville and Wilbur Wright made the first flight in an engine-powered airplane. The Wright

brothers had experimented with gliders. They chose the North Carolina coast for their testing because of its strong winds. Their first plane flight, with Orville piloting, lasted 12 seconds and covered 120 feet (37 meters). By 1905 the Wright brothers had improved their plane to the point that it could fly 24 miles (39 kilometers) in 38 minutes.

During World War I (1914–18) airplanes began to change the nature of war. Planes were first used to observe the enemy from the air. Eventually countries discovered that they could use planes for dropping bombs. Pilots also learned to shoot at each other in the sky.

Development of Modern Aviation

After the war people began to use planes for commercial purposes, including delivering mail. Pilots also began to experiment with seeing how far they could fly. A U.S. airmail pilot named Charles Lindbergh became famous in 1927 for making the first solo flight over the Atlantic Ocean.

Jet-powered aircraft were introduced on a small scale during World War II (1939–45). After the war jet planes were improved and came into wide use. Regular passenger jet services across the Atlantic were started in 1958. Today passenger jets fly people all around the world every day.

Air Travel Safety

Airline safety became an important issue in the second half of the 20th century. In the United States a government agency called the Federal Aviation

An early airplane flies over Chicago, Illinois, in 1911.

Did You Know?

Only a few experimental airplanes have used rocket engines. A rocket-powered airplane called the X-15 set records for speed and height of flight.

Administration (FAA) was created in 1958 to monitor aircraft and to investigate accidents. The FAA also operates the air traffic control system, which keeps planes out of each other's way. Human error, equipment failure, and weather can cause accidents. But flying is still far safer than traveling by car.

Airship

The large aircraft that are often seen floating over sporting events are commonly known as blimps. These are actually a type of lighter-than-air craft called an airship. Airships were developed from principles of ballooning. Like balloons, they are filled with a gas that allows them to float in the air. Unlike balloons, airships are driven by engine-powered propellers and steered with rudders. For this reason they are also called dirigibles—after the French word *diriger*, meaning “to steer.”

A colorful airship flies over Dodger Stadium in Los Angeles, California.

Most airships are long and cigar-shaped. Some airships have a rigid frame supporting the craft's surface fabric. Non-rigid airships are simply big balloons that rely on the gas to keep their shape. Nonrigid airships are also known as blimps. The main section of an airship is filled with a gas that is lighter than air. Helium is the most commonly used gas. A car, or gondola, suspended below the gas balloon holds the airship's crew and passengers.

Airships rely on several different features to enable them to fly. The gas inside the ship lifts the craft into the air. Engines then propel the craft forward. The pilot uses a rudder to steer the craft. Most of the ship is filled with the lighter-than-air gas. There are also compartments filled with normal air. The pilot can make the ship go up or down by controlling the amount of air in these compartments.

The first propeller-driven airship flew in 1852 in France. Its engine was powered by steam. The first rigid airship, with a body made of aluminum, was built in Germany in 1897. Ferdinand von Zeppelin, the famous German builder, completed his first rigid airship in 1900.

Aksum

Aksum, or Axum, was a powerful trading empire that flourished in northeastern Africa hundreds of years ago. Aksum also was the name of the kingdom's capital. It remains a city in northern Ethiopia.

One of the obelisks from the kingdom of Aksum stands in the modern city of the same name.

Aksum's location between the Red Sea and the Nile River helped to make it one of the most important and wealthy trading centers of its day. The items that moved in and out of its ports included ivory, hippopotamus hides, perfumes, gold, and animals.

The kingdom was also known for its architecture. Still standing in the central square of the city of Aksum are some of the carved granite obelisks made in the kingdom. An obelisk is a tall, thin pillar with a pyramid at the top. (The Washington Monument is an obelisk.) Some Aksum obelisks may have marked underground tombs of the kingdom's rulers.

Aksum expanded as it grew more powerful. In the AD 300s Aksum conquered the kingdom of Kush to the north. Aksum's rulers then pushed west across the Red Sea into southern Arabia. In the 600s and 700s the kingdom's hold weakened as the Muslim Arabs emerged as a power.

The people had been Christian since the 300s. The Arabs allowed them to keep the Christian religion because they had once given refuge to followers of Islam's founder, the prophet Muhammad. Today Aksum is considered a holy city of the Ethiopian Orthodox church.

Alabama

The state of Alabama is located in the center of the Deep South of the United States. Because of its location, the land that is now Alabama played a role in many of the major conflicts that shaped the United States. These included battles with Native Americans over control of the area, the American Civil War, and the civil rights movement of the 1960s. Montgomery is Alabama's capital.

Geography

Alabama lies in the southeastern United States. The southern parts of the Appalachian Mountains cover most of northern Alabama. The land is rugged, with forested hills and ridges. Southern Alabama is a mostly flat plain. The climate is

mild. Summers are long and warm. Winters are short and moderate.

People

People of European ancestry make up almost three quarters of Alabama's population. About one quarter of the population is African American. Slightly more than half of the people live in cities or towns. Birmingham is Alabama's largest city and industrial center. Mobile is a port city on Mobile Bay. Tuscaloosa is the home of the University of Alabama's main campus.

Economy

Trade and tourism are important service industries in Alabama. Tourists are drawn to Alabama because of its warm weather and recreational activities. Manufacturing, especially of paper and metal products, is also important.

Soybeans are a valuable crop in Alabama. Other farm products include peanuts, cotton, corn, and pecans. Shellfish and fish, such as shrimp and catfish, are also harvested.

History

The early Native Americans of Alabama are sometimes called mound builders. They lived in villages built around large earthen mounds. By the 1700s the Cherokee, the Creek, the Choctaw, and the Chickasaw were the main Native American tribes in the region.

The Spaniard Hernando de Soto explored the area in about 1540. In the early 1700s the French built settlements in several places. In 1763 France gave its land in North America, including Alabama, to Great Britain. During the American Revolution Spanish troops captured Mobile. In 1783 Britain surrendered Alabama to the United States. In 1813 the United States seized Mobile from the Spanish.

Alabama became a state in 1819. It prospered because of cotton farming. Black slaves did most of the work on the cotton farms. Alabama, like other Southern states, feared that the U.S. government would outlaw slavery. In 1861 Alabama withdrew from the United States. It joined with other Southern states to form a separate government called the Confederacy. U.S. forces defeated the

Confederacy in the Civil War, which ended in 1865. Alabama rejoined the United States in 1868.

Although the Civil War ended slavery, African Americans continued to struggle in Alabama. Several major events of the civil rights movement took place in the state. Martin Luther King, Jr., led a bus boycott in Montgomery in 1955–56. In 1965 he led a protest march from Selma to Montgomery. New laws passed during the civil rights movement helped improve conditions for African Americans in Alabama. Since the 1960s many black candidates have been elected to public office in the state.

Alamo

In the 1830s the people of Texas fought several battles to gain their independence from Mexico. One of the most famous battles took place at the chapel of a mission in San Antonio called the Alamo. More than 180 Texas fighters died while fighting against soldiers from Mexico. When Texans later won their independence from Mexico, their battle cry was, “Remember the Alamo!”

The Mission San Antonio de Valero was founded in about 1716 by Roman Catholic priests. They abandoned it before the end of the century. Afterward the chapel became known as the Alamo (Spanish for “cottonwood”) because it stood near a grove of cottonwood trees.

In 1835, during Texas’ war for independence from Mexico, the Texans captured

San Antonio. Afterward, however, fewer than 150 men were left there to defend the city. A few others arrived later, including the frontiersman Davy Crockett.

On February 22, 1836, about 5,000 Mexican soldiers arrived in San Antonio. On February 23 the Texas troops moved into the Alamo, prepared to resist an attack. The Mexicans surrounded the Alamo and the battle began.

On the morning of March 6 the Mexicans stormed the building through a hole in the outer wall. Within a few hours all of the defenders were dead. Texas finally gained independence later that year, and in 1845 it became a U.S. state.

The Alamo has been preserved as a historic site. It is a reminder of the time when Texans fought for independence from Mexico.

Alaska

The U.S. state of Alaska is an immense region of great natural beauty but few people. Nicknamed the Last Frontier, Alaska includes rugged coastlines, massive glaciers, and the tallest mountains in North America. The capital is Juneau.

Geography

Alaska is the largest state in the country. When it became a state, the land area of the United States increased by one fifth. The most northerly state, Alaska is not connected to the other 48 states of the mainland United States. Instead, it juts westward from Canada into the Arctic Ocean and the Bering Sea. The Aleutian Island chain extends southwest from mainland Alaska. To the southeast is a strip of land called the panhandle, which borders the Canadian province of British Columbia.

Northern Alaska lies within the Arctic regions. Along the northern coast is flat, treeless land called tundra. The ground there stays frozen year-round. South of the tundra are the mountains of the Brooks Range. The middle part of Alaska is a vast plain with many forests, marshes, and lakes. The Yukon, Alaska's largest river, flows through this region. Two mountain chains—the Alaska Range and the Aleutian Range—curve along Alaska's southern coast. Mount McKinley, in the Alaska Range, rises to a height of 20,320 feet (6,194 meters). It is the highest point in North America.

People

Alaska's population is spread unevenly throughout the state, with vast areas having few or no people. More than a third of Alaskans live in or around Anchorage, the largest city. Native Alaskans—Eskimo (Inuit), Aleut, and American Indians—make up about one sixth of the population. Common nationalities among the rest of the people include Russian, Filipino, Japanese, and Chinese.

Economy

Alaska's economy is based on oil, tourism, and fishing. Oil has brought Alaska so much wealth that the state has no income tax. In addition, every year the state gives each resident some of the money earned from oil sales. Service businesses such as airlines, restaurants, and hotels cater to tourists. About one fourth of all employed Alaskans work for the federal, state, or local government. Salmon is one of the state's lead-

ing products. Other catches include crab, halibut, herring, and shrimp. The main manufacturing industry is fish and seafood processing.

History

Hunters and gatherers from Asia first settled in what is now Alaska thousands of years ago. In 1728 a Russian expedition led by the Danish explorer Vitus Bering arrived there. In 1784 Russia established a settlement and fur-trading post on Kodiak Island, off the southern coast. Russia owned Alaska until the United States bought it in 1867. U.S. Secretary of State William H. Seward negotiated the deal. Because many Americans thought the purchase was a waste of money, Alaska was sometimes called Seward's Folly.

Gold discoveries in neighboring parts of Canada and in Alaska itself drew people to the area in the 1890s and early 1900s. A half century later, in 1959, Alaska became the 49th state in the Union.

Oil discoveries, especially along the Arctic coast, changed the state's economy. In the 1970s the Trans-Alaska pipeline was built to transport oil from the Arctic oil fields. The pipeline made Alaska second only to Texas in U.S. oil production. In the early 21st century environmental groups, government officials, and business leaders debated whether to open up more government-owned land in Alaska to oil exploration.

Albania

The citadel, or fortress, at Krujë was the stronghold of Albania's national hero, Skanderbeg. In the 1400s he fought to keep the Ottoman Turks from invading Albania.

The Republic of Albania in eastern Europe is the smallest country on the Balkan Peninsula. During most of its history Albania has been ruled by other countries and empires. The capital is Tiranë.

Geography

Albania is bordered by Greece, Macedonia, Kosovo, and Montenegro. Its western border is the Adriatic Sea. Most of Albania is mountainous. The highest mountain is Korab, at 9,026 feet (2,751 meters). Albania's only lowland area lies along the coast. The longest river is the Drin. Albania has warm, dry summers and mild, wet winters. Temperatures are more extreme in the mountain regions than on the coast.

Plants and Animals

Forests once covered much of Albania. After centuries of clearing and livestock grazing, many areas now have only bushes and scrub. The remaining forests have oak, beech, and pine trees.

Hunting has left few wild animals, except in the remote forests. Among them are wolves, jackals, wild hogs, bears, deer, and chamois (goatlike animals). The mild climate attracts many birds, however.

People and Culture

The people of Albania are divided into two major groups: the northern Gëgs and the southern Tosks. Each group speaks its own dialect, or variation, of the Albanian language. Minority groups, including Vlachs and Greeks, make up about 8 percent of Albania's population.

Albanian women tend to their crops.

About 39 percent of Albanians are Muslim. Others are Eastern Orthodox, Roman Catholic, or not religious.

Economy

The Albanian economy is one of the poorest in Europe. More than half of the workers are farmers. Albania's chief crops are vegetables, grains, melons, and potatoes. Sheep, goats, cattle, and poultry are the major livestock.

Albania manufactures textiles, glass products, leather, iron, steel, and office machinery. Its mines provide chromium and copper. The southwestern part of the country is rich in petroleum (oil) and natural gas.

History

The Illyrians, ancient ancestors of the Albanians, were likely the first people to live in what is now Albania. The Gëgs were Illyrians who settled in the north. The Tosks were Illyrians of the south. The Romans invaded in the 100s BC. In AD 395 the Roman Empire split into

two halves. Albania was in the eastern part, the Byzantine Empire. Bulgaria and Serbia later controlled the area.

In the late 1300s Albania became part of the Islamic Ottoman Empire. The Ottoman Turks ruled the country for almost 500 years. Albania gained its independence in 1912.

In 1928 Albania's president declared himself King Zog I. After Italy invaded Albania in April 1939, Zog fled the country. Germany took over from 1943 to 1944.

In 1944 Communist leader Enver Hoxha took over the Albanian government. Hoxha led Albania for four decades. During this period the Communist country was cut off from the rest of the world. After Hoxha's death in 1985, Albania reopened relations with many countries.

In 1998 and 1999 fighting broke out between Serbs and Albanians living in Kosovo. At the time, Kosovo was a province of Serbia that bordered Albania, and most of its residents were ethnic Albanians. Many of them crossed into Albania from Kosovo. Most of the refugees returned to Kosovo after the fighting ended, but some stayed in Albania. In 2008, Albanians rejoiced when Kosovo declared independence from Serbia.

Albany is the capital of the U.S. state of New York. The city's port on the Hudson River has long been a major shipping center. The port lies along a water route that links the Great Lakes to the Atlantic Ocean. State government also plays a large role in Albany's economy.

The first permanent settlement was founded on the site in 1624. Later the Dutch and then the English controlled the village. The English named it Albany in 1664. An important meeting called the Albany Congress was held in the city in 1754. At that meeting Benjamin Franklin proposed a plan to unite all the American Colonies under one government. Albany became the

capital of New York in 1797. In the early 1800s a railroad and the Erie Canal were built through Albany. They helped the city grow as a center of transportation.

Albany Congress

In 1754 representatives of the American Colonies put together a plan of union at the Albany Congress. Benjamin Franklin published a cartoon to show why he thought the union was important.

The Albany Congress was a meeting held in Albany, New York, in 1754. Representatives of some of Great Britain's American Colonies met with members of the Native American Iroquois Confederacy. The main purpose of the meeting was to discuss plans for the French and Indian War, which was just beginning. But the meeting is now remembered for its plan to unite the colonies.

The plan was written mostly by Benjamin Franklin. It called for one government for all the colonies. The leader was

The statehouse in Albany is the center of New York State's government.

to be a president-general appointed by the English king. The legislature was to be appointed by the existing colonial legislatures.

The congress passed the plan but it never went into effect. Both the king and the colonies thought it gave too much power to the other side. However, the plan served as a model when the colonies united to form the United States 22 years later.

Albatross

Albatrosses are large ocean birds with very long, narrow wings. They can fly long distances with little effort. They

The wings of a black-browed albatross can measure more than 7 feet (2.1 meters) from tip to tip.

glide gracefully for hours, even in heavy storms. However, these birds make clumsy “crash” landings. They also attract mates with funny-looking dances and displays. For these reasons sailors sometimes call them gooney birds.

There are more than 10 species, or types, of albatross. They belong to the family of birds called Diomedidae.

Albatrosses are birds of the open sea. They sleep on the surface of the water. They have no need to visit land except during breeding season. Most types fly over the South Pacific, Indian, and South Atlantic oceans. A few types fly over the North Pacific Ocean. Albatrosses breed and nest on islands.

Albatrosses are among the largest flying birds. They can weigh as much as 25 pounds (11 kilograms). The wingspan of the wandering albatross may be more than 11 feet (3 meters)—longer than that of any other living bird. An albatross has a big head, a hooked bill, and webbed toes. Most adult albatrosses have white body feathers with black, brown, or white wing feathers. A few types have brown feathers all over.

Albatrosses can soar on air currents for hours without flapping their wings. But they have difficulty flying in calm air.

Albatrosses eat mainly squid and sometimes fish. They also eat food scraps cast off by passing ships.

Alberta

A mountain is reflected in Lake Louise. The lake is part of Banff National Park in Alberta.

The province of Alberta in western Canada is one of the country's three Prairie Provinces, but it is known for its minerals as well as its crops. The province was named after Princess Louise Caroline Alberta, a daughter of Queen Victoria, when Great Britain ruled Canada. The capital is Edmonton.

Geography

Alberta borders British Columbia on the west and the Northwest Territories on the north. To the east is Saskatchewan, another of the Prairie Provinces. To the south is the U.S. state of Montana.

Most of Alberta's land is a flat plain. In the south the plain is treeless prairie, but in the north it is forested. The province is dotted with many lakes, especially in the north. In the southwestern part of Alberta are the Canadian Rocky Moun-

tains. The scenic Banff and Jasper national parks lie in the Rockies.

People

People with English, Scottish, or Irish ancestors make up the largest ethnic groups in Alberta. Many other residents have German, French, or Ukrainian origins. Though Alberta's American Indian population is fairly small, the province has more Métis than any other province. Métis have a mixed Indian and European background.

Four of every five people in Alberta live in cities or towns. The largest cities are Calgary and Edmonton. Calgary is a

Calgary is one of the largest cities in Alberta. It is located in the southern part of the province.

financial center and a shipping point for products of the surrounding farms and ranches. Edmonton is called the Gateway to the North because it is farther north than any other large Canadian city. It is a center of the oil and gas industry. The University of Alberta is in Edmonton.

Economy

Services, including banking, education, and health care, make up the biggest part of Alberta's economy. The province's spectacular mountain scenery attracts many visitors and makes tourism a leading service industry. Alberta's single largest industry, however, is energy production. The province produces half of Canada's oil and most of its natural gas. Alberta also mines almost half the coal produced in Canada. Refined oil and chemicals made from oil and natural gas are among the leading manufactured products. Food and wood products are also important.

Alberta's leading crop is wheat. Alberta's farms also produce barley, alfalfa, canola,

and hay. Millions of beef cattle graze on the grasslands of the province. Farmers and ranchers also raise sheep, hogs, and horses.

History

The first American Indians to live in what is now Alberta arrived about 10,000 years ago. The first Europeans did not arrive until 1754. They came to trap animals for their fur and to trade for furs with the Indians. Employees of the two main fur-trading companies, the Hudson's Bay Company and the North West Company, explored the region and built trading posts and forts.

In 1869 the new country of Canada purchased the Hudson's Bay Company's lands, which included all of what is now Alberta. Soon the area was opened to settlers, and many ranchers came. Alberta was made part of the Northwest Territories in 1882. Settlement increased after 1883, when the Canadian Pacific Railway reached Calgary from the east. Farmers moved in after new kinds of wheat were developed that could grow in the short northern summer. In 1905 the Canadian government made Alberta a province.

In 1914 oil was discovered at Turner Valley, near Calgary. In 1947 more oil was discovered at Leduc, near Edmonton. Energy production then became more important than farming in Alberta.

Alchemy

A painting shows three alchemists at work.

Hundreds of years ago people called alchemists tried to change lead into gold. They also tried to make potions that would allow people to live forever. Their field of study was called alchemy.

Alchemists experimented with metals, salts, acids, and other chemicals. They also developed many nonscientific and magical beliefs about the world. For instance, alchemists thought that the positions of the stars in the sky could affect their chemical experiments. Today scientists do not recognize alchemy as a science. However, some scientists believe that alchemists helped to lay the foundations for the modern science of chemistry.

In ancient times people practiced various forms of alchemy in China, India, Greece, and the Middle East. In about the 1100s people in Europe learned about some of these ancient practices. Some of them began their own experi-

ments. They tried to change lead into gold by heating it and mixing it with many other substances. They kept most of their procedures secret.

Alchemists were never able to make gold or to make people live forever. However, they made some useful discoveries. They figured out how to produce chemicals called mineral acids from other chemicals. They also learned how some chemicals react when mixed together.

Alcott, Louisa May

U.S. author Louisa May Alcott is best known for her novel *Little Women*. The book was based on her own experience growing up in a close-knit New England

Louisa May Alcott

family. It is one of several of her stories that are still cherished by young readers.

Alcott was born in Germantown, Pennsylvania, on November 29, 1832. She grew up in Boston and Concord, Massachusetts. Louisa received most of her schooling from her father, who was a teacher and philosopher. She began writing at a young age. By the 1860s her poems and stories were being published in *The Atlantic Monthly* magazine.

Alcott published *Little Women* in 1868. The book was instantly popular with younger readers, and it remains a favorite today. Alcott's other books for young readers include *Little Men* (1871) and *Jo's Boys* (1886).

Alcott spent most of the last 20 years of her life in Boston and Concord. She spent her time writing and caring for her sick parents. Alcott died in Boston on March 6, 1888.

Aleut

The Aleut are a native people of the Aleutian Islands, which are part of Alaska. They also live on the western portion of the Alaska Peninsula, a piece of land in southwestern Alaska that extends into the Pacific Ocean. The name Alaska comes from an Aleut word meaning "mainland." The Aleut are closely related to the Eskimo (Inuit).

The Aleut's early ancestors, the Paleo-Aleut, arrived in the Aleutian Islands

A young girl is one of the Aleut who still live on the islands off Alaska.

from the Alaskan mainland about 4,000 years ago. Traditionally, the Aleut lived off the sea. They fished and hunted animals such as seals, sea otters, whales, sea lions, and walruses.

The Aleut kept their traditional way of life until Russian settlers arrived in the 1700s. Conditions were harsh under Russian control, and many Aleuts died from disease or warfare. At the end of the 20th century fewer than 12,000 Aleuts lived in the United States.

short life he conquered almost all parts of the world that were known to his people.

Alexander was born in 356 BC in Pella, the capital of Macedonia, a kingdom to the north of Greece. The Greek philoso-

pher Aristotle gave him lessons. But Alexander's chief interest was war. In 338 BC Alexander's father, Philip II, brought all the Greek city-states except Sparta under his rule. Young Alexander commanded one part of the Macedonian army.

In 336 BC Philip II was killed and Alexander became king. He soon won the loyalty of nearly all of Greece. In 334 BC he brought together a large army and invaded the empire controlled by Persia. He freed the Greek settlements in Asia Minor (now Turkey) from Persian rule and made them his allies.

In 333 BC Alexander defeated King Darius III of Persia, at Issus. Alexander then marched southward along the coast of Phoenicia (present-day Lebanon). Late in 332 BC Alexander took Egypt from the Persians and became pharaoh, or king. He then controlled the whole

Did You Know?

One of the cities that Alexander founded in India was Bucephala. It was named for Alexander's horse Bucephalus.

eastern Mediterranean. Near the Nile River he founded the city of Alexandria.

In 331 BC Alexander went back into Asia and again defeated Darius. Then he was called king of Asia. Soon afterward he captured Babylon, in what is now Iraq, and Susa, the Persian capital.

Many of Alexander's men wanted to go home, but instead he had them advance further into Asia. In 327 BC Alexander went to India. There he fought his last great battle. He defeated the Indians and founded two cities. At this point Alexander's men refused to go farther. In 324 BC Alexander returned to Susa.

The next year Alexander went to Babylon. Weakened by his travels and battles, he died there of a fever. His body was eventually placed in a golden coffin in Alexandria, Egypt. His generals divided up his empire.

Alexander, Lloyd

U.S. children's author Lloyd Alexander is probably best known for his Prydain novels. This five-book series follows a young hero named Taran from the lowly status of assistant pig keeper to the throne of the kingdom of Prydain.

Lloyd Chudley Alexander was born on January 30, 1924, in Philadelphia, Pennsylvania. As a child, he enjoyed fairy tales and mythology.

Lloyd Alexander

Alexander's first published works were a novel for adults and several books about his own experiences. His first fantasy for children was *Time Cat: The Remarkable Journeys of Jason and Gareth* (1963). He began the Prydain fantasies the following year with *The Book of Three*. The series also includes *The Black Cauldron* (1965), *The Castle of Llyr* (1966), and *Taran Wanderer* (1967). The final book of the series, *The High King* (1968), won the Newbery Medal in 1969.

Alexander created the kingdom of Westmark as the setting for another series of novels: *Westmark* (1981), *The Kestrel* (1982), and *The Beggar Queen* (1984). Alexander's later books include *The Illyrian Adventure* (1986), and *How the Cat Swallowed Thunder* (2000). He died on May 17, 2007.

Alexandria

The city of Alexandria was founded by Alexander the Great when he conquered ancient Egypt in 332 BC. For hundreds of years it was Egypt's capital. Today it is the country's main seaport. It lies on the

Few structures remain from Alexandria's early history. A monument called Pompey's Pillar and a sphinx were once part of a temple of a god called Sarapis.

coast of the Mediterranean Sea northwest of Cairo.

Alexandria has stone structures that date back to when the city was part of the Roman Empire. They include an amphitheater and Pompey's Pillar, which was built in AD 297. There are also ancient tombs called catacombs.

The chief economic activities of Alexandria include shipping, banking, and the manufacturing of cloth. The city accounts for about a third of the industrial products made in Egypt. Cotton is the main export.

Alexander the Great, the Greek conqueror, founded Alexandria as a naval base and trade center. After his death in 323 BC, control of the city passed to one of his generals, Ptolemy I Soter. Ptolemy

made Alexandria the capital of Egypt, and it soon became the most important city in the world. Greek scholars and scientists went there to study in its great library. The Pharos, a lighthouse built in Alexandria's harbor, was one of the Seven Wonders of the World.

Alexandria came under Roman rule in 30 BC and Arab rule in AD 642. The Arabs built a new capital at Cairo and neglected Alexandria. In 1517 Alexandria was conquered again, this time by the Turks. By the late 1700s it was just a small fishing village. Alexandria revived as a trade center in the 1800s after canals were built to link the city to the Nile River. Today Alexandria remains a thriving port city.

Alfred the Great

More than 1,000 years ago a king named Alfred saved part of England from falling under the control of Denmark. At the time, England was divided into several small kingdoms, and Wessex was one of those. Alfred was king of Wessex. Although the other kingdoms fell to the Danes, Alfred kept Wessex free. One of England's best-loved kings, he is known as Alfred the Great.

Battles Against the Danes

Alfred was born in 849. He was the youngest son of Aethelwulf, king of Wessex. Alfred's older brother Aethelred

Alfred the Great

became king after Aethelwulf. When Aethelred died in 871, Alfred became king.

Alfred's people were the Saxons. They had come to Britain from Germany several hundred years earlier, along with the Angles and the Jutes. All were now threatened by the Danes, who were invaders from northern Europe. The Danes were also called Vikings.

Several English kingdoms fell to the Danes. In 871 and again between 876 and 878 Alfred's Wessex forces fought against the invaders. In the end the Danish king surrendered to Alfred.

In 886 Alfred went beyond Wessex and freed London. All the English people who were not ruled by Danes then accepted him as king. Alfred's son and grandsons eventually gained control over all of England.

Role as a King

Alfred was not only a bold warrior. He was also a smart organizer who knew how to build forts, use ships, and arrange alliances. In peace he was a wise ruler who tried to protect the weak from bad judges. He also gave his people better laws.

Alfred loved learning. He read books in Latin and hired scholars to translate them into English. Sometimes he did the translating himself. The Anglo-Saxon Chronicle, a record of England's early history, was begun in his reign. Alfred died in 899.

Algae

Algae are organisms, or living things, that are found all over the world. Algae are very important because they make much of Earth's oxygen, which humans and other animals need to breathe.

Some algae, such as seaweeds, look like plants. However, algae are actually neither plants nor animals. Instead they belong to a group of living things called protists.

There are about 27,000 different species, or types, of algae. They are most common in water, such as oceans, rivers, lakes, streams, ponds, and marshes. Some species live in soil or on leaves, wood, and stones. Algae even grow on animals such as turtles and polar bears.

An alligator hides in algae-covered water.

Algae can be green, blue, red, or brown. They vary greatly in size. Some species are so small that they can only be seen through a microscope. On the other

hand, the algae called kelp can reach 200 feet (60 meters) in length.

Algae differ from plants in several ways. They do not have stems or leaves, and their roots are different from plant roots. Algae also do not produce flowers or seeds, as plants do. Like plants, however, algae make their own food through a process called photosynthesis. Photosynthesis also releases oxygen into the air.

In addition to making oxygen, algae are important for other reasons. Water animals such as whales, seals, fish, octopuses, and starfish depend on algae for food. People also eat some types of algae. In many parts of the world farmers use seaweeds as fertilizer (a material to help crops grow).

Algeria

Algeria is a country on the north coast of Africa. It is the second largest country on the continent. Its history, language, customs, and Islamic religion make it a part of the Arab world. The capital is Algiers.

Geography

Algeria is bordered by Tunisia, Libya, Niger, Mali, Mauritania, Western Sahara, and Morocco. The Mediterranean Sea lies to the north.

The northern part of the country is known as the Tell. Most of the people live there. The Atlas Mountains separate the Tell from the Sahara Desert, which takes up about four fifths of the country. The Sahara contains plateaus and large areas of sand called ergs. It also features Algeria's highest peak, Mount Tahat, which rises to 9,573 feet (2,918 meters).

Northern Algeria has warm, dry summers and mild, rainy winters. The

The Erg Admer is a large area of sand dunes in southern Algeria.

Sahara can be very hot or quite cold, depending on the season and time of day. It rarely rains there.

Plants and Animals

Plants in Algeria survive without much water. The Tell region has evergreen shrubs and low trees. In the desert are tufts of grass, shrubs, and acacia and jujube trees.

Hyenas, jackals, monkeys, hawks, and desert snakes are native to Algeria. So are some antelope, hares, rodents, and wild boars. Scorpions are common in the Sahara.

People

Most Algerians have Berber or Arab ancestors. The Berbers were the people who lived in North Africa before the arrival of the Arabs. Arabs now make up more than 70 percent of the population. Almost all Algerians are Muslim.

Algeria borders the Mediterranean Sea to the north. In ancient times the land was part of several different empires that stretched along the sea.

Economy

The Algerian government controls the economy. Algeria's main products are petroleum (oil) and natural gas. However, most Algerians work in the government, the military, or in agriculture. Crops include wheat, potatoes, tomatoes, barley, dates, onions, oranges, olives, and grapes. Sheep and goats are the main livestock. Manufacturers make food and tobacco products; cement, bricks, and tiles; and iron and steel products.

History

Mainly Berbers lived in ancient Algeria. Waves of invaders—Phoenicians, Carthaginians, Romans, and Vandals—conquered them at different times. Muslim Arabs invaded in the 600s and 700s. The Turkish Ottoman Empire gained control of northern Algeria in 1518. France invaded in 1830 and made Algeria a French colony.

In the 1920s Algerians began to seek more rights. In 1954 a group called the National Liberation Front (FLN) began a war against France. Algeria won independence in 1962. The FLN controlled the new government.

Algeria held its first elections in 1991. One of the parties in the election was the Islamic Salvation Front (FIS), which wanted to establish an Islamic state. When it appeared likely that the FIS would win the largest number of seats, the military canceled the elections and took over the government. That action sparked a devastating civil war. In 1999 Algerians elected Abdelaziz Bouteflika, their first nonmilitary president since 1965. However, the violence continued into the 21st century as various groups continued to protest the actions of the government.

Algiers

Population
(2004 estimate)
1,790,700

Algiers is the capital of the North African country of Algeria. It is also Algeria's largest city and chief seaport. The city lies along the Bay of Algiers.

A people called the Phoenicians created a colony in the area in ancient times. But the town was destroyed in the 400s. Another group, called the Berbers, rebuilt the town in the 900s as a center of business. It became a prosperous city in the 1600s under Turkish rule.

The French captured Algiers in 1830. They made it the headquarters for France's colonies in North and West Africa. During World War II (1939–45) Algiers was the headquarters of the Allied forces in North Africa. Groups in Algeria began rebelling against France in the 1950s. Much of the fighting took place in Algiers. After

Algonquian

The Algonquians (or Algonkians) are a group of Native American tribes that traditionally spoke similar languages and had similar ways of life. The Cree, the Mohican, the Delaware (Lenni Lenape), the Ojibwa, the Shawnee, and the Algonquin are a few of the many Algonquian tribes.

The Algonquians probably once lived in southern Canada in the area north of the Saint Lawrence River. Over time they spread out, eventually occupying a large portion of what are now the United States and Canada. Their territory included New England, the Atlantic coast, the Great Lakes region, and part of the Great Plains.

Most Algonquians built their villages alongside rivers. They grew corn, beans, and squash in nearby gardens. They hunted deer, rabbits, and beaver and sometimes larger animals such as elk, moose, and bison (buffalo). They made much of their clothing from animal hides.

Most Algonquian tribes built dome-shaped houses called wigwams. Some tribes built longhouses of wood and bark that were large enough to house

several families. Others lived in cone-shaped tepees.

Religious practices varied among the Algonquians. Most tribes shared a belief in a great spirit called Manitou. They believed that Manitou was present in all things on Earth.

The Algonquians living along the Atlantic coast were among the first Indians to come in contact with settlers from Europe. They greeted the Pilgrims and the Jamestown settlers who arrived in the early 1600s. Many Algonquians died from diseases brought by the European settlers. The settlers also gradually forced the Indians to give up their land. By the mid-1800s most Algonquians were living on reservations. Thousands of people of Algonquian heritage still live in the United States and Canada.

Algonquin

The Algonquin (or Algonkin) people traditionally lived along the Ottawa River in what is now Canada. A version of their tribal name is used to describe one of the largest Native American language groups, the Algonquians. Different groups of Algonquin spoke different Algonquian languages.

The Algonquin lived in scattered forest villages. They made their houses from wood and bark. They planted corn,

A drawing of an Algonquin village shows homes and fields of crops.

beans, and squash but got most of their food by hunting and fishing.

The French began arriving in Algonquin territory in the early 1600s. The Algonquin traded animal furs to them in exchange for European goods. This trade made the Algonquin powerful for a while. But the Huron soon replaced them as the main trading partners of the French. Warfare with the powerful Iroquois eventually drove the Algonquin from their homeland. Many Algonquin joined other tribes. Some returned to their territory once their relations with the Iroquois had improved.

After the British defeated the French in the French and Indian War (1754–63), the Algonquin became friends of the British. However, British settlers who moved into the Ottawa River valley took away much of the Algonquin land. At the end of the 20th century about 8,000

Did You Know?

Ali, Muhammad

Muhammad Ali fights Ernie Terrell in 1967.

U.S. boxer Muhammad Ali was a gifted athlete with a personality that brought him fans and fame. He was known for such phrases as “I am the greatest!” and “float like a butterfly, sting like a bee.”

Muhammad Ali was born on January 17, 1942, in Louisville, Kentucky. His original name was Cassius Marcellus Clay. At the age of 18 Clay won a gold medal at the Olympic Games in Rome. He became the world heavyweight champion in 1964.

In 1964 Clay joined the Nation of Islam and changed his name to Muhammad Ali. At the time the United States was fighting the Vietnam War. In 1967 Ali

refused to join the armed forces because of his religion. He was convicted of breaking the law. His title was taken from him and he was not allowed to box again until 1970. In 1971 the U.S. Supreme Court cleared Ali of all criminal charges.

In a match against George Foreman in 1974, Ali regained the world heavyweight title. In 1979 Ali announced that he would retire. He came out of retirement for matches in 1980 and 1981, but he was defeated both times. In later years Ali suffered from Parkinson’s disease, which affects the brain and the muscles.

Allegheny Mountains

The Allegheny Mountains, or the Alleghenies, extend from Pennsylvania to Virginia in the eastern United States. They are noted for their scenic beauty. At one time these mountains were an obstacle to settlers who wished to move westward.

The Allegheny Mountains become very colorful in the fall as the leaves on the trees begin to change.

The Alleghenies are part of the Appalachian Mountains. They stretch more than 500 miles (800 kilometers) and consist of two nearly parallel ridges.

At Mount Davis near the Maryland border, the Alleghenies rise to 3,213 feet (979 meters), the highest point in Pennsylvania. The highest point in West Virginia is 4,863 feet (1,482 meters), at Spruce Knob.

A large amount of coal is mined from the Allegheny range. Heavy forest cover makes the Alleghenies a rich source of timber, too.

Appalachian Mountains

Allen, Ethan

Ethan Allen was a patriot and a soldier. He won an important early victory in the American Revolution. Allen led a band of fighters called the Green Moun-

tain Boys against the British at Fort Ticonderoga, in what is now New York.

Ethan Allen was born on January 21, 1738, in Litchfield, Connecticut. In 1757 he fought in the French and Indian War. In 1762 Allen became an ironworker. Several years later he moved to what is now Vermont.

Vermont was not a separate colony at the time. New Hampshire and New York both claimed the territory. To aid the New Hampshire side in the dispute, Allen organized the Green Mountain Boys. (The name of Vermont comes from the French words for “green mountain.”) After the start of the American Revolution, the group fought the British.

On May 10, 1775, the Green Mountain Boys captured Fort Ticonderoga. Later that year Allen was captured by the British during an unsuccessful attack on Montreal, Canada. He was released in 1778. The Army then made him a colonel, but he fought no more in the war.

A picture from the 1800s shows Ethan Allen capturing Fort Ticonderoga.

Did You Know?

Pets are a common cause of allergies. Skin cells and saliva of cats, in particular, can cause sneezing, itching, and watery eyes.

Allen spent his later years trying to make Vermont a state. New York still wanted the territory for itself and interfered with his efforts. After the war Allen even talked with the British about making Vermont part of Canada. This hurt his reputation as an American patriot. He died on February 12, 1789, in Burlington, Vermont.

Allergy

An allergy is the human body's negative reaction to certain foreign substances. Some allergies are commonplace. Many people suffer from hay fever when pollen is in the air. Some develop skin rashes when they touch certain substances. Others experience stomach cramps after eating particular foods. When a person reacts in these ways to any outside substance, that individual is said to be allergic to it.

Sneezing is a common sign of some allergies, such as hay fever.

Allergies and the Immune System

Several things happen to cause an allergic reaction. First, a person is exposed to a substance such as pollen. The bodies of most people would simply ignore pollen. Some people's bodies, however, treat it as a harmful invader. When this happens, the person's immune system produces substances called antibodies to fight the pollen's effects.

The antibodies produced in the body tend to stay in the blood. Because of this, the immune system remembers and recognizes the specific substance that attacked the body. The next time the body comes in contact with the substance, the antibodies react to it again.

Signs of an Allergic Reaction

The antibodies react by releasing a chemical called histamine. Histamine causes fluid to build up in the body and cell tissues to swell. That is why the eyelids of a person with hay fever become red and puffy. Histamine also affects muscles. This can cause breathing difficulties or stomach cramping and pain. One severe type of allergic reaction is known as anaphylactic shock, or anaphylaxis. Some people have this reaction if they take certain drugs, eat foods such as nuts and shellfish, or get stung by certain insects. Anaphylaxis has very severe symptoms and sometimes leads to death.

Treatment

Most people quickly learn which allergies they have. When possible, they try

to avoid contact with the substance that causes the allergy. Unfortunately, substances such as dust and pollen are everywhere. Taking drugs known as antihistamines can decrease the allergic reactions. Antihistamines prevent histamine from reaching the cell tissues.

Alligator

Alligators are large lizardlike animals with long, rounded snouts and powerful tails. They spend most of their time in the water, but they also travel on land. Alligators belong to the group of animals called reptiles. They are related to crocodiles.

Where Alligators Live

Alligators live along the edges of swamps, lakes, and slow-moving rivers. There are two species, or types, of alligator. The American alligator lives in the southeastern United States. The Chinese alligator lives in the Yangtze River region in China. It is very rare.

Physical Features

Male American alligators measure about 11 feet (3.4 meters) in length on aver-

American alligator

top view

alligator

crocodile

A view from above shows the different snouts of an alligator and a crocodile.

age. The females are slightly smaller. Young American alligators are black with yellow stripes on the tail. The adults are brownish.

The Chinese alligator normally grows to a length of about 5 feet (1.5 meters). It is blackish with faint yellowish markings.

Alligators have many features in common with crocodiles. They have thick skin composed of many scales and plates. They each have a long body and four short legs. The eyes, ears, and nostrils are located on top of the head. These show above the water when the animal floats.

However, there are easy ways to tell alligators and crocodiles apart. One of the most obvious is that alligators have broad, rounded snouts, while most crocodiles have narrow, pointed snouts.

Behavior

Alligators eat mainly fish, small mammals, and birds. But they sometimes kill prey as large as deer or cattle.

Alligators usually mate during the spring. The female builds a nest of mud and grass. She lays 20 to 60 white eggs in the nest. The eggs hatch after about 65 days. The young alligators live with their mother for as long as a year.

Allosaurus

Allosaurus was a fierce dinosaur that roamed Earth before the similar but more well-known *Tyrannosaurus rex* appeared. The name *Allosaurus* means “other lizard.” *Allosaurus* is a member of the group of dinosaurs known as theropods. The theropods were meat-eating dinosaurs that walked on their two back legs.

When and Where *Allosaurus* Lived

Allosaurus lived about 163 to 144 million years ago. Most *Allosaurus* fossils, or remains, have been found in North America, in Colorado, Utah, New Mexico, Montana, South Dakota, and Wyoming.

Physical Features

Allosaurus reached up to 39 feet (12 meters) in length, stood about 15 feet (4.5 meters) tall, and weighed up to 2 tons. The massive head of *Allosaurus* measured about 3 feet (1 meter) long and was supported by a short, thick neck. The sharp teeth of *Allosaurus* were curved and had sawlike edges. *Allosaurus* had sharp claws on the three toes of each hind foot. It also had long, grasping claws on the three toes of each front foot. The long, heavy tail of *Allosaurus* may have helped the animal balance itself.

Behavior

Allosaurus was a meat-eating dinosaur that preyed on plant-eating dinosaurs. When it hunted alone, *Allosaurus* would hide among thick plants and then jump out on its prey. Some scientists believe that *Allosaurus* also hunted in packs. Together, a pack of *Allosaurus* could bring down very large dinosaurs, such as *Apatosaurus* and *Diplodocus*. Scientists believe that *Allosaurus* reproduced by laying eggs.

Alloy

An alloy is a substance made of two or more metals or of a metal and nonmetallic materials. To make an alloy, the ingredients are melted and mixed together. When the mixture cools, it hardens.

Alloys are generally more useful than pure metals. Pure metals may rust or wear away easily. They may also be too soft to hold a shape. But mixing other substances with a pure metal often results in a hard and strong substance.

People first learned to make alloys more than 5,000 years ago. Ancient peoples used a combination of copper and tin, called bronze, to make tools and weapons. Today such things as church bells and statues are made of bronze. Brass, a combination of copper and zinc, is another ancient alloy. People today use brass to make such things as doorknobs and musical instruments.

A South American mask is made of a gold and silver alloy. Its ears and eyes are made of copper.

Steel is one of the most important modern alloys. Steel is a mixture of iron, carbon, and other substances. Steel is useful in building construction and many other industries. Another important modern alloy contains aluminum and small amounts of copper or other substances. Aircraft and other vehicles are often made of aluminum alloys.

Almond

Almonds are commonly called nuts, but they are actually seeds. They come from a tree that is closely related to the peach tree. People eat almonds as a snack and also use them in cooking and baking. Almonds can also be pressed to obtain a fragrant oil.

The United States, Spain, Greece, Iran, and Turkey are major almond producers. Most almonds produced in the United States come from California.

There are two types of almonds: sweet and bitter. Sweet almonds are the kind people eat. Bitter almonds contain a poison, but their oil can be used for food after the poison is removed.

Almond trees do not grow much taller than 30 feet (9 meters). They bloom in early spring. Bitter almond blossoms are white, and sweet almond blossoms are pink. The fruits look like peaches, but they are smaller and flatter. Inside each fruit is a pit, or nut. The nut has a hard

Did You Know?

Stainless steel is an alloy that contains iron, chromium, and other metals. Stainless steel is useful because it does not rust easily.

The fruits of the almond tree open to reveal the nuts. The almond seeds are inside the hard shells.

shell surrounding a seed. The seed is the part that people eat.

As the fruit ripens, it splits open to reveal the nut. Workers use machines to shake the trees and make the nuts fall to the ground. The nuts may be left to dry on the ground, or they may be dried in an oven. Workers then use machines to shell, sort, and pack the nuts for shipment.

Alphabet

An alphabet is a system used to represent language in written form. Each letter stands for a single spoken sound. Many languages use alphabets. But some languages use other systems to represent words in writing. For instance, in Japanese and Cherokee each symbol represents a group of sounds rather than a single sound. The Chinese writing system uses symbols to represent the meaning of words, not their sounds.

The Latin alphabet is the alphabet of English and most European languages. It has 26 letters. Other alphabets might have fewer or more letters. Like other alphabets, the Latin alphabet developed from earlier forms.

Early Writing Systems

People in early societies drew pictures to communicate ideas. In ancient times people in the Middle East developed the world's first writing system. It used symbols to stand for the meanings of words. Later it also used some symbols to represent the sounds of words.

More than 3,000 years ago people in what is now Syria used a simpler writing system. This system is called North Semitic. Most modern alphabets trace their history back to that system. North Semitic used only 22 symbols. It did not have any signs representing whole words. Instead each letter represented a consonant. There were no symbols for vowels. People known as the Phoenicians later slightly changed this system.

A computer keyboard has Latin and Japanese letters. It sits on top of a document written in Chinese characters.

The First Five Letters in Some Major Alphabets				
Latin	Hebrew	Arabic	Greek	Russian Cyrillic
A a	א (aleph)	ا (alif)	Α α (alpha)	А а
B b	ב (beth)	ب (ba)	Β β (beta)	Б б
C c	ג (gimel)	ت (ta)	Γ γ (gamma)	В в
D d	ד (daleth)	ث (tha)	Δ δ (delta)	Г г
E e	ה (he)	ج (jim)	Ε ε (epsilon)	Д д

Greek and Latin Alphabets

The ancient Greeks changed the Phoenician writing system to create their own alphabet. Some people consider the Greek alphabet to be the first true alphabet. This is because it has symbols for vowels and consonants. The Greek alphabet is the ancestor of all modern European alphabets, including Latin.

The ancient Romans, who spoke Latin, developed the Latin alphabet. As the Roman Empire grew, the Latin alphabet spread throughout the empire’s vast lands. It became the alphabet of many other languages in addition to Latin. The alphabet changed over time. New letters were needed to pronounce words in other languages. Other letters were combined.

Other Alphabets

The North Semitic writing system also gave rise to other ancient alphabets, including Aramaic. The modern Hebrew and Arabic alphabets developed from the Aramaic alphabet. Today people in Israel and Jews around the world use the Hebrew alphabet. People in large parts of the Middle East and North Africa use the Arabic alphabet. In Hebrew and Arabic a small group of consonants gives

the basic meaning of a word. Vowels slightly change the meaning.

The ancient Aramaic alphabet probably also influenced the earliest-known writing system of India. This system, called Brahmi, dates back more than 2,500 years. Nearly all the modern alphabets of India trace their history to Brahmi.

The Cyrillic alphabet was created more than 1,000 years ago. Members of the Eastern Orthodox church in eastern Europe used it for religious texts. The Cyrillic alphabet was based on the Greek alphabet of the time. Today people in Russia, Ukraine, Bulgaria, Serbia, and elsewhere use versions of the Cyrillic alphabet.

Alps, The

The Alps are the youngest, highest, and most densely populated mountain range in Europe. They were formed about 44 million years ago. The Alps fill most of Switzerland and Liechtenstein and extend into France, Germany, Austria, Italy, and Slovenia. On the west, the

Did You Know?

The word alphabet was created from a combination of “alpha and beta.” These are the Latin names for the first and second letters of the Greek alphabet.

Alps run along the border between France and Italy.

The highest peak in the Alps is Mont Blanc in France, at 15,771 feet (4,807 meters). Several other high peaks are located on or near the Swiss-Italian border. They include the Matterhorn.

The Alps receive a great deal of snow and rain. At high elevations, the snow turns to ice and then flows down to the

valleys as glaciers. Sometimes masses of snow rush uncontrolled down the mountainsides. These events, called avalanches, endanger Alpine communities. The clear Alpine lakes are noted for their beauty. Among the most prominent are Lakes Geneva, Constance, Como, and Zürich.

The Alps are nearly treeless near the top, but forests grow below. The higher forests have mostly spruce, pine, and larch trees. Oak, beech, and chestnut trees grow on the valley floors and lower slopes. A few kinds of animals have adapted well to living in the higher mountains. These include the ibex, the Alpine marmot, and the mountain hare.

Humans have lived in the Alps since prehistoric times, 50,000 to 60,000 years ago. German cultures developed in the eastern Alps, while Roman culture influenced the west. Some areas of the Alps were cleared of forests during the Middle Ages (500 to 1500). Farmers settled the land, planted crops, and raised cattle. During the 1800s, railroads were constructed, opening up the area.

Many people began to travel to the Alps during the 1900s. Air, auto, and rail transportation to the Alps improved, making it easier for people to get there. Today entire villages lodge, feed, and entertain tourists. Popular resorts include Innsbruck, Austria; Grenoble, France; and Saint Moritz, Switzerland.

The Matterhorn is one of the tallest peaks in the Alps.

Alzheimer's Disease

Alzheimer's is one of the most destructive diseases of old age. The disease destroys nerve cells in the brain. As a result, the brain stops working correctly and the memory is affected. Most people who have Alzheimer's disease are more than 60 years old. Some people, however, get it before that age.

The symptoms, or signs, of Alzheimer's disease begin mildly and then become more severe over time. At first, people with Alzheimer's seem forgetful. Gradually, they lose their entire memory. People with Alzheimer's also have a hard time speaking and understanding other people. They may not even recognize close friends and family, such as their own children. Eventually, they lose control of body and mind.

Scientists are not sure what causes the death of nerve cells in the brains of people with Alzheimer's disease. They think the cause might be a genetic defect. This means there might be a problem with one of the genes that is passed from parent to child. Because the cause is unknown, there is no way to prevent or cure Alzheimer's disease. Medications help to slow the disease in some patients.

Amazon River

The Amazon is the mightiest river in South America. It carries more water

than any other river. It is about 4,000 miles (6,400 kilometers) long. Only the Nile River in Africa is longer.

The Amazon begins in the Andes Mountains in Peru. From there it flows north and then east through Brazil. It empties into the Atlantic Ocean. The Amazon drains about one third of South America. This area includes most of Brazil and Peru and parts of Bolivia, Ecuador, Colombia, and Venezuela.

Plants and Animals

The Amazon region is the site of the world's largest rain forest. Its plant and animal life is remarkably rich. Almost three fourths of all the types of plants in the world grow there. The animals include monkeys, anteaters, anacondas, toucans, and huge rodents called capybaras. The flesh-eating piranha is among the river's many fish.

People

Millions of Brazilians live in cities in the Amazon region. Belém, Manaus, and Santarém are large, growing cities.

Did You Know?

The Amazon River carries about 10 times as much water as the Mississippi River.

At one time almost 7 million Indians lived in the Amazon region. Europeans arrived in the 1500s. They took many Indians into slavery and removed them from Brazil. Other Indians died from diseases carried by the Europeans. In the 1990s there were about 600,000 Indians in the Amazon. Most live in remote areas.

Economy

The countries of the Amazon region have encouraged businesses to use the resources found there. Mahogany, Amazonian cedar, and other trees are cut down for their wood. Rubber is another valuable plant product. Diamonds, gold, and oil are mined.

Many people have become concerned about the effects of economic development in the Amazon. Scientists warn that destroying parts of the forest threatens the plants and animals that live there.

Amber

Amber is a hard, yellowish, and often see-through substance that formed from tree resin. Resin is a thick fluid that oozes from pine and fir trees when their bark is injured.

The resin that formed amber came from trees that grew millions of years ago. Over time these trees and their resin became buried beneath Earth's surface. The trees eventually decayed and disappeared. But the resin hardened further, until it became amber.

Millions of years ago, insects were trapped in resin. The resin eventually hardened into amber.

Many pieces of amber contain the remains of insects or plants in the form of fossils. These living things were trapped in the resin before it hardened into amber. Scientists study these creatures to learn how living things have changed over millions of years.

People have found amber throughout the world. However, most of it comes from the shores of the Baltic Sea in northern Europe. This amber is buried in sands that are 40 million to 60 million years old.

Ancient people valued amber for its beauty. They used it to make beads and carvings. The ancient Greeks and Romans also believed that amber had magical and healing properties. Artists today turn pieces of clear amber into jewelry and other objects.

Ambulance

An ambulance is a vehicle used to transport people who are sick or injured. Most ambulances are either trucks with space for patients or cargo vans with raised roofs. Ambulances usually take patients to a hospital.

Specially trained people called emergency medical technicians, or EMTs, ride in ambulances. They give sick or injured people emergency medical care before they reach the hospital.

Ambulances have many types of equipment that are used to move and to treat patients. Equipment for moving patients includes stretchers and cots with wheels. An ambulance's medical equipment helps to treat breathing

problems, heart attacks, broken bones, and burns right away.

Large cities have hundreds of ambulances. They are owned by public and private hospitals, fire departments, and private emergency medical services.

Some places use airplanes or helicopters as ambulances. These air ambulances have the same equipment as ground ambulances. Air ambulances reach people in out-of-the-way areas. They also transport patients more quickly than ground vehicles.

Most ambulance developments took place during wartime. In the early 1800s the French army used two-wheeled, horse-drawn wagons to bring soldiers to battlefield hospitals. In the 1860s public hospitals began keeping their own horse-drawn ambulances. The first motorized ambulance was built in 1899. Airplanes were used as ambulances for the first time during World War I (1914–18). Helicopters first served as ambulances during the Korean War (1950–53).

Amendment

A change or addition to a law is called an amendment. The word usually refers to a change to the constitution of a government. In the United States there have been 27 amendments to the Constitution. The most famous of these are the first 10. They are known as the Bill of Rights.

Did You Know?

The only way to repeal, or cancel, an amendment to the U.S. Constitution is to pass another amendment.

Only one amendment to the U.S. Constitution has ever been repealed.

The 19th Amendment to the U.S. Constitution gave women the right to vote.

Passing an amendment to the U.S. Constitution is a two-step process. The first step is for two thirds of the members of the Senate and two thirds of the members of the House of Representatives to vote for the amendment. The second step is for the amendment to be ratified, or approved, by the legislatures of three quarters of the states.

Every U.S. state has its own constitution, and almost all of them have been amended more times than the U.S. Constitution. The constitution of Alabama has more than 700 amendments. In many states voters must approve amendments.

American Civil War

In the 1860s the northern and southern parts of the United States fought the American Civil War. The war started after 11 Southern states separated themselves from the United States and formed their own government. Their army fought the forces of the U.S. government. The Civil War threatened to break up the United States. It is also called the War Between the States.

Buildup to War

The North and the South had been divided for many years over the issue of slavery. The Southern economy was based largely on cotton, which was grown on large farms called plantations. African slaves did most of the work on the plantations. The North had small farms that used paid workers. The Northern economy also relied more on manufacturing.

Neither side wanted the other's ideas to spread to new states being created in the West. Northerners wanted to stop the spread of slavery. But Southerners believed that the U.S. government did not have the right to decide whether or not slavery should be allowed in a state. They feared that the government's next step would be to stop slavery altogether.

Missouri Compromise

In 1819 the U.S. Congress had to decide whether to allow Missouri to become a state. Missouri wanted to join as a state that would allow slavery. Some North-

A map shows where the major battles of the American Civil War took place.

erners in Congress were not happy with this. Congress therefore could not agree about what to do. Finally, Maine asked to join the country as a free state, or a state that would not allow slavery. Congress then agreed to let Missouri join as a slave state and Maine join as a free state. This became known as the Missouri Compromise of 1820. The Compromise also banned slavery north of Missouri's southern border.

Kansas-Nebraska Act

The Missouri Compromise lasted until Congress passed the Kansas-Nebraska Act in 1854. The act created Kansas and Nebraska as new territories in the area

where slavery was supposed to be forbidden. Yet the act allowed the people of the territories to choose whether or not to allow slavery. In Kansas the act led to armed conflict. On one side were Southerners who supported slavery. On the other side were Northern abolitionists, who wanted to end slavery.

The Confederacy and the Union

Southerners became more upset when Abraham Lincoln was elected U.S. president in 1860. Lincoln belonged to the Republican Party, which opposed slavery. Southern states decided to secede (withdraw) from the United States to protect their right to keep slaves. South

Carolina, Mississippi, Florida, Alabama, Georgia, Louisiana, Texas, Virginia, Arkansas, North Carolina, and Tennessee seceded. They formed a government called the Confederate States of America, or the Confederacy. Jefferson Davis was the Confederate president.

Did You Know?

There were 21 million Northerners and only 9 million Southerners at the time of the American Civil War. More than one third of the Southerners were slaves.

The states that stayed loyal to the United States were called the Union. Four states—Kentucky, Missouri, Maryland, and Delaware—stayed in the Union even though they allowed slavery. They were called border states. In addition, the western counties of Virginia refused to join the Confederacy. They later joined the Union as the state of West Virginia.

Going into the war the Union had several advantages over the Confederacy. It had more people, more industries, and more railroads. But the Confederacy had better military leaders.

Events of the War

Fighting broke out in 1861 and lasted until 1865. By the end of 1861 two major battlefronts had developed. One was in the East, where Virginia, Maryland, and Pennsylvania suffered most of the fighting. The other front was in the West. That front started along the Mississippi River and then spread.

1861

The American Civil War began on April 12, 1861, in Charleston, South Carolina. Confederate troops captured Fort Sumter from the Union Army. Afterward both sides quickly raised armies.

Many African Americans fought in the Union Army. Members of the 107th U.S. Colored Infantry pose for a photograph in Virginia in 1865.

The first major battle of the war was fought on July 21. About 30,000 Union troops marched toward the Confederate capital of Richmond, Virginia. The Confederates stopped them at a stream named Bull Run, near the town of Manassas. The Union troops were forced back to Washington, D.C. The defeat shocked the Union.

1862

Union forces had some success in the West in 1862. In February Union troops under General Ulysses S. Grant captured Confederate forts in western Tennessee. These included Fort Henry and Fort Donelson. In April Grant led the Union to victory in the battle of Shiloh, near Pittsburg Landing, Tennessee. Then the Union navy took the city of New Orleans.

The war's most notable battle at sea was fought in Virginia in March 1862. It was the first battle ever fought between ships that were covered with iron. Nei-

ther the Confederacy's *Merrimack* nor the Union's *Monitor* could win a clear victory.

General Robert E. Lee led the Confederacy to important victories in the East. In August 1862 his forces won a second battle at Bull Run. Then Lee invaded the North. Union troops stopped the Confederates at Antietam Creek, Maryland, in September. But in December Lee's troops defeated Union troops at Fredericksburg, Virginia.

1863

At the start of the war President Lincoln wanted mainly to keep the United States together. Ending slavery was not his main goal. This changed after the battle of Antietam. The Union victory encouraged Lincoln to issue a statement called the Emancipation Proclamation. The proclamation freed all slaves in Confederate states. As a result of the proclamation, many blacks joined the Union Army.

In May 1863 Lee defeated Union forces near Chancellorsville, Virginia. Then he again invaded the North. Lee suffered his first big defeat in July at Gettysburg, Pennsylvania.

The battle of Gettysburg turned the war in favor of the Union. A day later Grant captured the city of Vicksburg, Mississippi, for the Union. Then the Union controlled the entire Mississippi River. In November 1863 Grant and General William Tecumseh Sherman drove the Confederates out of Chattanooga, Tennessee.

Confederate Generals Stonewall Jackson (left) and Robert E. Lee are pictured together in 1863. Jackson died after being wounded in the battle of Chancellorsville in that year.

1864–65

In March 1864 Lincoln rewarded Grant by giving him command of all the Union armies. While Grant fought in Virginia, Sherman went to Georgia. He captured Atlanta in September. Then he led his troops on a march to Savannah, a port on the Atlantic Ocean. Along the way they destroyed railroads and sup-

Union Army officers are photographed in Virginia in August 1865.

On April 9, 1865, General Robert E. Lee (right) surrendered to General Ulysses S. Grant at Appomattox, Virginia.

plies. Sherman captured Savannah in December.

By March 1865 Lee was very short of men and supplies. On April 3 Grant captured Richmond, the Confederate capital. He accepted Lee's surrender in Appomattox, Virginia, on April 9. By the end of May all Confederate armies had surrendered.

Reconstruction

After the war the defeated states were gradually allowed back into the United States. The South rebuilt damaged property and changed its economy so it no longer depended on slaves. This period was known as Reconstruction. It lasted until the last U.S. troops left the South in April 1877.

American Revolution

The American Revolution was the war in which Great Britain's 13 American colonies won their independence. The colonies became a new country, the United States. The revolution began in 1775 and ended in 1783.

Background

Before the 1760s the colonies had a lot of freedom even though they were under British rule. The British government was across the Atlantic Ocean, more than 3,000 miles (5,000 kilometers) away. The colonies had their own leaders and learned to solve their own problems. Plus, because Britain was often at war, it

The first shots of the American Revolution were fired in Lexington, Massachusetts, on April 19, 1775.

did not always pay close attention to the colonies.

In the 1760s, however, the British government tried to take more control over the colonies. One major reason for this change was the French and Indian War. Britain defeated France in the war in 1763. But the war had been very costly. Afterward, Britain decided that its American colonies should help to pay its debts.

Taxes

To raise money, Britain forced the colonies to pay new taxes. In 1765 the British lawmakers, called Parliament, passed a law called the Stamp Act. The act put a tax on legal papers, newspapers, and other printed items. The colonists protested against the tax. They were especially angry because Parliament was taxing them even though they had no representatives in Parliament. Because of the protests, the British government ended the tax in 1766.

In 1767, however, a British official named Charles Townshend got Parliament to pass several new tax laws. The Townshend Acts taxed tea, lead, paint, paper, and glass coming into colonial ports. These taxes made the colonists even angrier.

Boston Massacre and the Tea Party

To keep order, the British government sent soldiers to Boston, Massachusetts. On March 5, 1770, British soldiers fired shots into a crowd of colonists. Crispus

Attucks and several other Americans were killed. This event became known as the Boston Massacre.

On the same day as the Boston Massacre, Parliament did away with most of the Townshend Acts. They kept a tax on tea, however. Then, in 1773, Britain passed a law that allowed a British company to sell tea more cheaply than colonial merchants. On December 16, 1773, colonists boarded British ships in Boston Harbor and threw their cargo of tea into the water. This event became known as the Boston Tea Party.

Intolerable Acts

The British government then passed laws that were even harsher. The colonists called them the Intolerable Acts. The strongest of these acts closed the port of Boston until the colonists paid for the tea they had ruined. Massachusetts was put under military rule.

The colonists realized that the colonies had to act together. In 1774 representatives from every colony except Georgia met in Philadelphia, Pennsylvania. The meeting was called the Continental Congress. The representatives called on Britain to cancel the Intolerable Acts. The British government answered by sending in even more troops.

Early Battles

By this time many colonists believed that their problems with Britain could not be worked out peacefully. They prepared to fight. They formed groups of soldiers called minutemen. The minute-

Did You Know?

Patriots in different colonies kept in touch with each other through groups called Committees of Correspondence. Samuel Adams of Massachusetts started the first one in 1772.

men were to be ready to fight “at a minute’s warning.”

In April 1775 Britain sent a force to seize the colonists’ military supplies in Concord, Massachusetts. Paul Revere and William Dawes rode through the countryside to warn the colonists that the British soldiers were coming. On April 19 a group of minutemen met the British in Lexington, a town on the way to Concord. After a short fight, the British moved on to Concord. Another group of American soldiers forced them to turn back. The battles of Lexington

and Concord began the American Revolution.

The Second Continental Congress met in Philadelphia in May 1775. It brought together the military forces of the colonies to form the Continental Army. It put George Washington in charge of the army. Washington spent months preparing his troops for battle.

Meanwhile the first major battle of the war took place at Bunker Hill, near Boston. The British captured Bunker Hill on June 17, 1775. But they lost so

many soldiers that the colonists claimed victory. The battle encouraged the colonists.

Fighting for Independence

Before 1776, most colonists did not want to break free from Britain. They only wanted to get Britain to do something about their complaints. But as the fighting spread, more colonists became convinced that they had to separate from Britain. On July 4, 1776, the Continental Congress approved the Declaration of Independence. With this document, the 13 colonies became the United States of America.

The Americans struggled against the larger and better-equipped British Army. In the summer and autumn of 1776 the British forced George Washington's troops out of New York. The Americans were driven across New Jersey into Pennsylvania. But then Washington defeated the British in Trenton and Princeton, New Jersey. These victories kept the struggle for independence alive.

The turning point of the war was the battle of Saratoga, in New York. On October 17, 1777, General Horatio Gates led the Continental Army to a great victory over the British. The victory helped to bring France into the war on the side of the new United States. France sent ships and soldiers.

The winter of 1777–78 was a very hard one for the Americans. Washington and his troops camped at Valley Forge, near Philadelphia. They suffered terribly from hunger and illness. But they emerged in

British General John Burgoyne (center, in red coat) surrenders in Saratoga, New York, on October 17, 1777.

the spring as a stronger fighting force. They defeated the British in Monmouth, New Jersey, on June 28, 1778.

Final Battles

In the last years of the war most of the fighting took place in the South. In

General George Washington (right) walks through his army's camp at Valley Forge, Pennsylvania, in 1778. With him is Baron von Steuben, a German officer who helped to train the troops.

According to tradition, Molly Pitcher served bravely in the battle of Monmouth, New Jersey, on June 28, 1778.

1780 the British, led by General Charles Cornwallis, won battles in South Carolina. But in 1781 American and French forces trapped Cornwallis in Yorktown, Virginia. He surrendered on October 19, 1781. The fighting was over.

The peace treaty was signed on September 3, 1783, in Paris, France. It was called the Treaty of Paris. By signing the treaty, Britain agreed that the United States was an independent country.

Americas, Exploration and Settlement of the

When Christopher Columbus crossed the Atlantic Ocean in 1492, he thought he had reached eastern Asia. In fact he had opened up to Europeans a new world with two continents—North America and South America—and many islands. Many more Europeans followed Columbus to the Americas. Most were from Spain, Portugal, France, and England.

The Americas were named not for Columbus but for Amerigo Vespucci. He was an Italian merchant and explorer who took part in at least two voyages to the Americas in the late 1400s and early 1500s. Vespucci was one of the first people to realize that the land Columbus found was not a part of Asia.

Exploring by Ship

Vikings

Columbus was probably not the first European to reach America. Vikings from northern Europe traveled to the coast of what is now Canada in about AD 1000. The Vikings did not stay long, however.

Columbus

By the time of Columbus, Europeans had traveled to the East and explored many parts of Asia. Many other Europeans admired the cloths, spices, and medicines that the explorers brought back with them. They wanted more of these goods. But the voyage to Asia was long and expensive. Educated Europeans knew that the world was round. They thought that by sailing west, they could find a shorter route to Asia.

Between 1492 and 1504, Christopher Columbus made four voyages across the Atlantic Ocean. Columbus reached Central and South America as well as the islands that are now called the West Indies. He never reached Asia, but his trips inspired many others to follow.

Magellan

Ferdinand Magellan of Portugal did what Columbus had set out to do: he found a western sea route to Asia. He followed the South American coast southward from Brazil. In 1520 he passed around the tip of South America into the Pacific Ocean. Magellan died, but his crew kept sailing west. They went past the southern tip of Africa back to Spain. This was the first voyage around the world.

Later Voyages

In 1497 John Cabot, an Italian working for England, reached Newfoundland, in what is now Canada. In 1535 Jacques Cartier of France sailed from the Atlantic Ocean into Canada on the Saint Lawrence River.

John Cabot landed in what is now Newfoundland in 1497. He was one of the first Europeans to land in North America.

In 1610 the Englishman Henry Hudson sailed into the large bay in Canada that is now called Hudson Bay. Hudson was trying to find a water route through North America to the Pacific Ocean. People called this unknown route the Northwest Passage. The first explorer to find this passage was the Norwegian Roald Amundsen—in 1906.

Hudson Bay in Canada and the Hudson River in the United States were named for the explorer Henry Hudson.

Did You Know?

The Roman Catholic church sent many missionaries into Spanish, Portuguese, and French colonies. Their task was to convert the Native Americans to Catholic Christianity.

Settling the Land

The riches of the Americas attracted many early settlers, or colonists. Some worked on their own, while others worked for European trading companies. Both groups wanted to make money selling valuable things back to Europe. Gold and silver were the most valuable products of South America and Mexico. Further to the north, the furs of animals were the most valuable products.

As Europeans began settling the land, they met many Native Americans. Their relations were often friendly. But Native Americans grew angry as Europeans took over more land. Wars between settlers and Native Americans killed thousands. Many more Native Americans died from smallpox and other European diseases.

Meanwhile, European settlers began to grow the crops that Native Americans grew, including corn, potatoes, pumpkins, squash, peanuts, and tobacco. Europeans also brought plants like sugarcane and coffee to the Americas and found that they grew well there. Some Europeans set up large farms and sold their crops back to Europe.

Some of the first European farmers captured Native Americans and forced them to work as slaves. African slaves eventually replaced them. The Portuguese brought in Africans to work as slaves starting in 1502. The English were active slave traders also. The slave trade did not end until the 1800s.

Spanish Colonies

The earliest Spanish settlements were in the West Indies. The Spanish set up Santo Domingo on the island of Hispaniola in 1496. It was the first capital of Spain's colonial empire, called New Spain.

Francisco Pizarro conquered what is now Peru and founded the city of Lima there.

In 1513 Vasco de Balboa traveled across Central America. He became the first European to view the Pacific Ocean from the Americas. Six years later Hernán Cortés made his first attack on the Aztec Empire in Mexico. In 1533 Francisco Pizarro took Peru away from the Inca people. The Spanish stole gold and silver from the native empires and shipped it back to Spain.

Spain's colonial empire became the biggest in the Americas. At its peak it included the largest Caribbean islands, all of Mexico and most of Central America, large sections of South

America, Florida, and the southwestern quarter of what is now the United States.

English Colonies

The important English colonies were on the Atlantic coast of North America. In 1607 merchants from the Virginia Company founded Jamestown. This was the first permanent English settlement in North America.

Other English settlers soon founded Plymouth Colony and Massachusetts Bay Colony in New England. These colonies were unusual. The people who started them had reasons besides making money. They wanted freedom to practice their own forms of Christianity. They could not find this freedom in Europe.

The English settled other parts of the Americas, too. Starting in 1670, the English traders of the Hudson's Bay Company set up trading posts in Canada. In the Caribbean Sea, England had settlements on several islands. The largest was Jamaica, which England seized from Spain in 1655. The English

Massasoit, chief of the Wampanoag Native Americans, visits with the English settlers called Pilgrims.

settled Belize in Central America in 1638. Scattered settlements in South America united to form British Guiana in 1831.

French Colonies

France's settlements in North America were known as New France. Most of these settlements were in what is now Canada. The French explored widely, made friends with Native Americans, and built forts and trading posts. The fur trade became the basis of New France's economy. In the late 1600s and early 1700s the French captured many trading posts from the Hudson's Bay Company.

In 1608 Samuel de Champlain founded Quebec as the first permanent French settlement. One French explorer, the Sieur de La Salle, floated down the Mississippi River in 1682 and claimed all the land it drained.

France also claimed islands in the Caribbean Sea, including what is now Haiti.

Queen Elizabeth I is pictured asking English explorer Sir Walter Raleigh to start a colony in Virginia for England.

In the mid-1600s France founded French Guiana on the northeastern coast of South America.

France and England (which united with Scotland to form Great Britain in 1707) often fought over land in North America.

In 1562 French explorer Jean Ribaut brought colonists from France to North America. They landed near Saint John's River in what is now Florida.

One such fight became known as the French and Indian War. At the end of that war, in 1763, Great Britain won control of French Canada. It also won all other French territory east of the Mississippi River. France sold its territories farther west to the United States in 1803.

An illustration from 1698 depicts the last expedition of the French explorer Sieur de La Salle

Other Colonies

The Portuguese were among the earliest explorers in the Americas. However, the only colony they set up was Brazil, in South America.

In about 1626 the Dutch built a settlement in North America called New Amsterdam. The English took over New Amsterdam in 1664 and renamed it New York. The Dutch also set up colonies in the Caribbean. They are now known as the Netherlands Antilles.

Russia came to North America from the west. The Russians set up their first permanent settlement in Alaska in 1784. The Russians traded for furs as far south as California. In 1867 Russia sold Alaska to the United States.

End of Colonialism

Most colonies in North, Central, and South America became independent between 1776 and 1826. Many islands, however, remained colonies.

In 1823 President James Monroe of the United States issued a statement called the Monroe Doctrine. It declared that European countries were no longer welcome to set up colonies in the Americas.

Amman

Population
(2004 estimate)
1,036,330

Amman is the capital of the Middle Eastern country of Jordan. The city spreads over a series of rolling hills. Amman is Jordan's largest city. It is also Jordan's main center of business, finance, and international trade.

People have lived in the area for thousands of years. In ancient times the city was the capital of the Ammonites, a people often mentioned in the Bible. Egypt conquered the city more than 2,000 years ago. Many other powers controlled the city over the years. But

Amman has many remains of buildings from ancient times. A theater built by the Romans almost 2,000 years ago is just one example.

for reasons that are still unknown, Amman disappeared by AD 1300.

In 1878 some people fleeing Russia created a small village in the area. Amman's revival began in 1921. That year it became the capital of a territory called Transjordan. Transjordan (now Jordan) became an independent country in 1946. After that, Amman grew rapidly.

Jordan

Amoeba

An amoeba is a one-celled creature that is among the simplest of all living organisms. Most amoebas are so small that they can only be seen through a microscope. There they look like tiny blobs of colorless jelly.

Amoebas are found in fresh and salt water. They also live in the moist body parts of other animals and in moist soil. At least six types of amoeba are found in human beings.

An amoeba has few parts. It has a thin covering called a membrane. Inside is a nucleus, food vacuoles, and a contractile vacuole. The food vacuoles digest food. The contractile vacuole gets rid of extra water.

Amoebas move by changing their shape. First, an amoeba extends a part of its jellylike body outward, like a stubby finger projecting out of a closed fist. This projection is called a pseudopod, or false foot. The amoeba then pours the main

part of its body into the pseudopod, which makes the pseudopod grow bigger. Eventually the pseudopod gets so big that it becomes the whole body. New pseudopods form as old ones disappear.

For food, amoebas depend mainly on plants and other one-celled animals. Amoebas use their pseudopods as mouths. The pseudopods reach out to surround the food and flow over it.

To reproduce, the nucleus of the amoeba simply splits into two pieces. The two halves pull apart, and each half takes part of the cytoplasm. In this way, a single amoeba becomes two.

Amphibian

Most of the animals known as amphibians can live on land or in water. Amphibians are vertebrates, or animals with backbones. Amphibians were the first vertebrates to appear on land. The early amphibians were the ancestors of all reptiles, birds, and mammals.

There are three basic groups of amphibians. The first group consists of frogs

and toads. The second group consists of salamanders, including newts and mud puppies. The third group is made up of wormlike creatures called caecilians. Altogether there are more than 4,000 species, or types, of amphibian.

Where Amphibians Live

Amphibians are found nearly all over the world. They are most common in hot, humid areas such as the tropics. Some adult amphibians live only on land. Other types live only in water. However, most amphibians spend part of the time on land and part of the time in water.

Physical Features

Most amphibians are relatively small. However, they vary greatly in length, from less than 0.4 inch (1 centimeter) to more than 60 inches (150 centimeters).

Amphibians do not have hair or feathers. Their skin takes in oxygen. In other words, amphibians breathe through their skin. Most kinds also breathe through lungs or organs called gills.

Amphibian skin takes in water, too. Most amphibians have moist skin. In most species, if the skin dries up, the animal soon dies. The skin often contains glands that make a slimy fluid called mucus. Mucus helps protect the skin from drying out.

Many amphibians also have glands in the skin that make poison. This helps protect an amphibian from other animals that want to eat it. For example, poison may make the amphibian taste bad or hurt the predator's mouth.

Did You Know?

Some amphibians change their skin color to blend in with their surroundings. This makes them harder for enemies to see.

Tree frogs, such as the green tree frog, have special sticky feet that help them climb trees.

Frogs and Toads

Adult frogs and toads are tailless. Their eyes are large and well developed. They have short, thick bodies and four legs. Frogs use their long, powerful back legs for leaping and swimming. Toads have shorter back legs than frogs do. They walk or hop about. Unlike other amphibians, toads have skin that is often dry, with bumps that look like warts.

Salamanders

Salamanders have long tails. Most salamanders have a small head, a short body, and four legs. If a salamander loses its tail or a leg, it can usually grow a new one.

Caecilians

Caecilians look like worms or snakes. They have long, slender bodies with no arms or legs. Skin or bone covers their eyes, so the animals are blind or nearly blind. Most kinds live underground, where they tunnel about.

Behavior

Amphibians are cold-blooded. This means that their body temperature is always about the same as the temperature of their surroundings. If their environment gets too hot or cold, amphibians move to another place to become more comfortable. For instance, a frog may move from the shade into the sunshine to warm its body.

During cold winters some amphibians become very inactive for months. They enter a resting state called hibernation. They become active again when it gets warmer. Some amphibians also become inactive during hot, dry summers.

Adult amphibians eat a wide variety of foods. Frogs, toads, and salamanders eat mainly small boneless animals such as

Salamanders (top) have smooth, wet skin, like frogs' skin. Caecilians (bottom) are amphibians that look like worms.

insects, worms, and spiders. Some large salamanders and frogs eat small birds and mammals. Most caecilians eat worms.

Life Cycle

Most amphibians lay eggs, but some species give birth to live young. In most egg-laying species, the female deposits a large number of eggs in the water.

The life cycle of most amphibians is divided into two phases. In the first phase the amphibian lives in the water in an immature form called the larva. In frogs and toads the larva is also called a tadpole. The larva begins life with gills, which allow it to breathe underwater like a fish. The larva stage may last from several weeks to five years, depending on the species.

In the second phase the larva develops into the adult form. In most species, the animal loses its gills and develops lungs. It is then capable of living on land at least part of the time. The animal's body structure may change in many other ways, too. For example, a tadpole grows legs and loses its tail. The change from larva to adult is called metamorphosis.

However, some species do not have separate larva and adult forms. They are born in the same form as adults, only smaller.

Amsterdam

Population

(2008 estimate), urban area,
1,482,287

Amsterdam is the largest city in The Netherlands, a country in northwestern Europe. It is the official capital of The Netherlands. However, the government offices are in the city of The Hague.

Amsterdam is a historical city as well as the country's major economic center. It is also famous as a place of freedom and tolerance. Tourists go to Amsterdam to see its scenic canals and collections of great art. Museums in the city display the works of important artists from The Netherlands, including Rembrandt and Vincent van Gogh.

The Amstel River flows through Amsterdam. The city also lies on a body of

A boat travels down a canal in Amsterdam.

water called the IJ (pronounced “eye”). A canal connects the IJ with the North Sea. Amsterdam is a major port.

Part of Amsterdam’s land used to be underwater, but people drained the land. A system of pumps, barriers, and canals keeps the water from rushing in again. Boats travel through the city along a cobweb pattern of canals. More than 1,000 bridges provide land connections over the canals.

Economy

For seven centuries Amsterdam has been a center of international trade and transportation. Other important industries include banking, insurance, and tourism. Industries that provide services to businesses also bring money to the city.

History

Amsterdam began as a fishing village in the 1200s. By the 1400s it was an important port.

During the 1500s many Jews and Protestants fled religious wars in other parts of Europe. Many settled in Amsterdam because it was known for its religious freedom.

The 1600s were Amsterdam’s golden age. The city grew wealthy as a center of trade and banking. Amsterdam declined somewhat in the 1700s.

Nazi troops from Germany controlled Amsterdam in the 1940s, during World War II. The Nazis murdered most of Amsterdam’s Jews.

After the war Amsterdam began to thrive again. Its economy grew greatly in the late 20th century.

Amundsen, Roald

Roald Amundsen

The Norwegian explorer Roald Amundsen was one of the most important people in the history of polar exploration. He traveled to both the Arctic and the Antarctic, and he was the first person to reach the South Pole.

Roald Engelbregt Gravning Amundsen was born in Borge, Norway, on July 16, 1872. His father, a shipowner, died when Roald was 14. Young Amundsen always wanted to be a polar explorer, but to please his mother he studied medi-

Did You Know?

A young Jewish girl named Anne Frank and her family hid from the Nazis in Amsterdam for two years. The building where they hid is now a museum.

cine. When his mother died, Amundsen left school and went to sea.

At age 25 Amundsen made his first voyage to the Antarctic, as part of a Belgian expedition. Then in 1903 he set out with his own ship and crew to explore the Arctic. By the end of this expedition, in 1906, Amundsen had become the first navigator to find his way through the Northwest Passage from the Atlantic to the Pacific Ocean. This had been a dream of explorers for 400 years.

In 1909 the explorers Robert Peary and Matthew Henson became the first people to reach the North Pole. Amundsen then decided to try to be the first to reach the South Pole. He set out with four men, 52 dogs, and four sleds and reached the pole on December 14, 1911.

In 1918 Amundsen tried to drift across the North Pole in a boat, but the ice was too thick. In 1926, with two companions, Amundsen flew over the North Pole in a dirigible, a lighter-than-air craft. Amundsen died near the Arctic island of Spitsbergen on June 18, 1928.

Anaconda

Anacondas are huge, nonpoisonous snakes. They live in or near water in warm parts of South America. Anacondas are constrictors. This means that

The giant anaconda is one of the largest snakes in the world.

they usually kill their prey by coiling their body around it and squeezing until the animal can no longer breathe. Anacondas are one of the two largest types of snakes in the world. Certain pythons grow longer, but anacondas are much heavier.

Anacondas are members of the boa family. There are two species, or types, of anaconda: the giant, or green, anaconda and the yellow, or southern, anaconda. The giant anaconda is the larger species. It is usually brown or olive green with oval-shaped black spots. The yellow anaconda is tan or greenish yellow with overlapping black spots.

The largest anacondas reach about 30 feet (9 meters) in length, but most grow only to about 16 feet (5 meters). Some anacondas weigh as much as 550 pounds (249 kilograms). Their thick, bulky bodies may measure 12 inches (30 centimeters) or more around.

Anacondas usually hunt at night for mammals, reptiles, and birds. Although

anacondas constrict larger prey, they may kill turtles, birds, or other small animals by using their mouth and sharp teeth alone. Sometimes they may pull their prey underwater to drown it. After killing their prey, anacondas swallow it whole.

Nine months after mating, female anacondas give birth to large litters of live young. A litter has 14 to 82 young. Each young measures more than 2 feet (0.6 meter) long.

Anasazi

The Anasazi were a Native American people whose civilization developed beginning in about AD 100. They are also known as the Cliff Dwellers because of the great buildings they constructed along the sides of cliffs. They lived in the area where the present-day states of Arizona, New Mexico, Colorado, and Utah meet.

Cliff Palace is an ancient Anasazi building at Mesa Verde National Park in Colorado.

Early Anasazi houses were underground pits lined with stone walls. In time, these pit houses developed into kivas, or structures where religious ceremonies were performed. Then the Anasazi began to live aboveground in simple, one-story houses made from mud and wood or stone.

Probably by about the mid-800s, the Anasazi began constructing multistoried structures that resembled modern apartment buildings. The Anasazi built some of these buildings into the sides of cliffs, where they were difficult for their enemies to attack.

The earliest Anasazi survived by hunting and gathering wild plants. By about 700, however, they had learned to grow corn, beans, squash, and other crops. As their farming methods improved, their food supply grew. Their population grew, too, and they built large permanent settlements.

No one knows why, but by about 1300 the Anasazi had mostly abandoned their multistoried buildings. They broke into smaller groups and moved south and east where they built new villages.

The Anasazi's descendants are the Pueblo Indians. They established smaller villages, mostly clustered in the Rio Grande Valley of New Mexico and Arizona. At the end of the 20th century there were about 60,000 Pueblo Indians living in the United States.

Anatomy

Anatomy is the study of the structures that make up the bodies of living things. It is a branch of the science of biology.

Scientists learn about body structures mainly by dissecting, or cutting apart, bodies. They may dissect human or animal bodies, plants, or other life-forms such as bacteria. Scientists identify the structures inside the life-form and how they are put together.

Importance of Anatomy

Scientists study anatomy to learn about the size, shape, and position of different body parts—for example, the skin, muscles, bones, and organs of humans. The study of human anatomy is important in medicine. Medical students learn how the parts of a healthy human body fit together and

how they function. This helps them treat bodies that are not functioning properly.

Scientists also compare the anatomies of different types of living things. They observe the similarities and differences of their structures. This helps them determine how different types of living things are related to one another and how they developed over time.

History

An ancient Greek doctor named Herophilus is often called the Father of Anatomy. He performed dissections of human bodies, sometimes in public, in about the 300s BC. The ancient Greek doctor Galen later wrote many books about human anatomy. They were a major source of anatomy information in Europe for centuries. However, they contained many errors. Many of his ideas were not based on direct observations of the human body.

The modern science of anatomy began to develop in the 1500s. In 1543 a doctor named Andreas Vesalius wrote the first detailed and illustrated anatomy textbook based on observed facts. He performed careful dissections of human bodies in order to study them.

The first powerful microscopes were developed in the late 1600s. These instruments allow scientists to study tiny structures in the body such as cells and their parts. As technology has improved

Did You Know?

The most famous book about human anatomy is called *Gray's Anatomy*. Henry Gray wrote the first edition in 1858. Other scientists have kept it up to date.

Andersen, Hans Christian

A girl feeds the ducklings in an illustration for the story "The Ugly Duckling."

The fairy tales of Hans Christian Andersen are popular today, just as they were when first published in Denmark in the mid-1800s. His stories include such favorites as "The Ugly Duckling" and "The Emperor's New Clothes."

Hans Christian Andersen was born on April 2, 1805, in a Danish fishing village called Odense. Andersen's family was very poor. As a boy, he attended school only occasionally. He visited the theater and found that he loved performing. When Andersen was 11 years old, his

father died. Shortly after that, Andersen began working in various trades.

At age 14 Andersen moved to Copenhagen, the capital of Denmark, to try to become an actor or dancer. But he did not have much success. Andersen later studied at the University of Copenhagen.

Andersen's first collection of tales for young people was published in 1835. It included the story "The Princess and the Pea." Andersen wrote his tales as if they were being told out loud, often using expressions that people heard every day. He also drew on his own experiences to create characters who were poor or even outcasts. During his long writing career, he wrote more than 200 stories. Andersen also spent much time traveling throughout Europe, Asia, and Africa, and he wrote several travel books. He wrote plays, poems, and novels, too. Andersen died on August 4, 1875, in Copenhagen.

Anderson, Marian

The singer Marian Anderson had a pure, rich voice and could sing a great range of parts. An African American, she is also remembered for breaking down barriers between blacks and whites in the United States.

Anderson was born on February 27, 1897, in Philadelphia, Pennsylvania. At age 6 she began singing in her church choir. At age 19 she studied singing with a famous teacher who was so

Marian Anderson sings at the Lincoln Memorial in Washington, D.C.

impressed by her talent that he gave her free lessons.

In 1925 Anderson gave a recital with the New York Philharmonic Orchestra. But because of her skin color, many opportunities were closed to her in the United States, where at the time blacks and whites were often kept apart. Audiences in other countries embraced Anderson, however. In the 1930s she made successful singing tours of Europe.

In 1939 Anderson was prevented from arranging a concert in Washington, D.C., because blacks were not allowed in the concert hall. Many Americans, including First Lady Eleanor Roosevelt, were outraged. They arranged for her to sing outside the Lincoln Memorial instead, and 75,000 people came to hear her.

In 1955 Anderson became the first African American to perform with the renowned Metropolitan Opera in New York City. Two years later she published *My Lord, What a Morning*, the story of

her life. Anderson died on April 8, 1993, in Portland, Oregon.

Andes

The Andes Mountains of South America are the longest mountain chain in the world. The chain also contains the highest mountains in the Americas. The Andes were settled long ago by American Indian peoples. They continue to attract interest today because of their mineral wealth.

Features

The Andes Mountains stretch from north to south along the entire western side of South America. They separate a narrow strip of land along the Pacific Ocean from the rest of the continent. The Andes are

© 2006 Encyclopædia Britannica, Inc.

about 5,500 miles (8,900 kilometers) long and in most places are no wider than 200 miles (320 kilometers).

Many Andean peaks are higher than any mountains in North America. At 22,831 feet (6,959 meters), Argentina's Mount Aconcagua is the highest mountain anywhere in the world outside Asia.

Plants and Animals

Plant and animal life in the Andes varies based on height and climate. The highest peaks and some very dry places have very few plants. But rainy parts of the eastern Andes have lush tropical forests. Animals of the Andes include pumas, chinchillas, and several relatives of the camel, including llamas, guanacos, and alpacas. The Andean condor is a vulture that is one of the world's largest flying birds.

People

Humans first settled in the Andes more than 10,000 years ago. Indian peoples such as the Inca established cities in high valleys and built roads through mountain passes. Most people in the Andean region even today have at least some Indian ancestors.

Most of the people of the mountains are involved in farming. Most crops are grown for use within the region, but some are exported. Increasing numbers of people have also become involved in mining. The Andean region is one of the world's richest sources of minerals. Copper, iron ore, tin, lead, zinc, silver, gold, platinum, and emeralds are all produced in the Andes, especially in the south.

Andorra

The European country of Andorra is one of the smallest in the world. The capital is Andorra la Vella.

Geography

Andorra lies in the southern Pyrenees Mountains between Spain and France. The Valira River runs through its valleys. Andorra has a number of natural sources of hot water called thermal springs.

The climate of Andorra is generally dry. It has cold, snowy winters and warm summers.

Plants and Animals

Pines and firs grow in Andorra's mountains, where chamois (goatlike animals) and birds of prey also live. Andorra has reintroduced several threatened animals, including species of trout and deer, to their former habitats. Wild boars and weasels are other native animals.

People

Most Andorrans are of Spanish origin and Roman Catholic. Catalan, a language of eastern Spain, is the official language. Andorrans also speak Spanish and French. Only about one third of the people are Andorran citizens. The rest are mostly citizens of Spain, France, or Portugal.

Economy

Tourism, banking, trade, and construction are the most important parts of Andorra's economy. Some tourists visit the medieval churches, castles, and bridges. Others come for skiing and other winter sports.

Manufacturers in Andorra make electrical equipment, cars and car parts, newspapers, and clothes. A few farmers raise tobacco, hay, potatoes, and sheep.

History

The emperor Charlemagne captured Andorra from the Muslims in AD 803. It later passed to the Spanish bishops of the town of Urgel. In the late 1200s Andorra became a coprincipality, a land governed by two princes: the bishop of Urgel and the leader of France. In 1993 Andorrans voted for a new constitution that gave more power to their legislature, the General Council.

Andorra la Vella

Population
(2008 estimate)
24,574

Andorra la Vella is the capital of the tiny western European country of Andorra. The town lies in a valley of the Pyrenees Mountains.

Andorra la Vella is popular with tourists because of its scenic beauty and winter sports areas. It is also a retail shopping center for goods from Asia and other parts of Europe.

Andorra la Vella was long isolated from the outside world. Roads built in the 1930s helped make it more modern. In the second half of the 1900s the town's population grew along with its industries.

Andorra la Vella sits in a mountain valley. One of the main tourist sites in the city is the Casa de la Vall. It is where Andorra's legislature meets.

Angkor Wat

A temple dating back to the 1100s, Angkor Wat is located in Cambodia. It is the world's largest religious structure.

Physical Features

Angkor Wat is about 5,100 feet (1,554 meters) long and 4,498 feet (1,371 meters) wide. It is surrounded by a wall and a moat. Of its original nine towers, five still stand.

The temple was originally dedicated to the Hindu god Vishnu. Carvings illustrate Hindu legends and glorify the king who ordered the temple built. Sculptures portray him as Vishnu or show him performing kingly functions. Many Hindu images were later replaced by Buddhist art.

History

From the 800s to the 1400s the city of Angkor was the capital of a powerful Cambodian kingdom called the Khmer Empire. Angkor Wat is the most famous of the city's temples. The Khmer started building the temple during the reign of King Suryavarman II, which lasted from about 1113 to 1150. It was not finished until after his death. In 1177 Angkor was looted by invaders. The next king decided that the Hindu gods had failed. He made Angkor Wat a Buddhist shrine.

The city of Angkor was abandoned in the 1400s. However, Angkor Wat itself was maintained by Buddhist monks as a

Anglo-Saxon

Hundreds of years ago people known as the Anglo-Saxons lived in and ruled England. They were descendants of three different peoples. The Angles and Saxons came from different parts of what is now Germany, and the Jutes came from Jutland, a part of Denmark.

In the 400s the Celtic Britons who were living in England asked the Angles, Saxons, and Jutes to protect them from fierce tribes in the north. In return for their services the Angles, Saxons, and Jutes were given land. Gradually they became more powerful and pushed the

Britons aside. They became the rulers of the land.

Eventually the name Anglo-Saxon came to be used for all people living in England, as the Angles, Saxons, and Jutes mixed with other invaders and the original Britons. The Anglo-Saxons spoke an early form of English that is now called Old English. They lived in houses made of wood, thatch (straw), and twigs woven together and covered with mud or clay. When the mud or clay hardened it made a solid roof or wall. Anglo-Saxons fed themselves by farming. They harvested grains, fruits, and vegetables and raised livestock.

Anglo-Saxon rule ended in 1066. In that year England was conquered by the French forces of William, duke of Normandy, during what is known as the Norman Conquest.

A rare gold coin shows an Anglo-Saxon king.

Angola

The country of Angola lies on the southwestern coast of Africa. After about 500 years as a colony of Portugal, Angola suffered decades of civil war beginning in 1975. The capital and largest city is Luanda.

Geography

Angola is bordered by Congo, the Democratic Republic of the Congo, Zambia, and Namibia. The Atlantic Ocean lies to the west. The small oil-rich area of Cabinda is separated from the rest of Angola by a strip of the Democratic Republic of the Congo.

A plateau, or raised land, covers the eastern two thirds of Angola. Mountains separate the plateau from the coast. Lowlands lie along the coast and near the Congo River.

Angola has a warm, tropical climate, with a rainy season that lasts from Octo-

Houses with thatched roofs line a hillside in Angola.

ber to mid-May. The southwest is dry, while the northeast is humid.

Plants and Animals

Rain forests once covered Angola, but loggers and farmers cut down many of the trees. Angola now has many savannas, or grasslands with scattered trees.

Civil war and hunting have endangered many animals, including African elephants, black rhinoceroses, giant sable antelopes, and Angolan giraffes. Angola also has leopards, lions, hyenas, elephants, hippopotamuses, zebras, and buffalo. Many birds and a wide variety of reptiles, including crocodiles, live there, too.

People

Bantu peoples make up most of Angola's population. The two largest groups are the Ovimbundu and the Mbundu. Groups of San live in the southeast. Portuguese is the official language. How-

Masks from Angola are on display at a museum.

ever, the people speak such local Bantu languages as Umbundu, Kimbundu, and others. Traditional religions have largely given way to Christianity. A majority of the Christians are Roman Catholics.

Economy

Angola's economy is based on its natural resources of petroleum (oil), natural gas, and diamonds. Agriculture, fishing, and manufacturing play smaller roles in the economy. Farmers raise cassava, corn, sugarcane, sweet potatoes, bananas, cattle, and goats. Manufacturers make food products, beer, shoes, and fabric.

History

Ancient peoples in what is now Angola practiced ironworking and agriculture.

Eventually Bantu peoples set up a number of kingdoms. The most powerful of these was the Kongo kingdom around the Congo River. It was founded in the 1300s.

Portuguese explorers arrived in 1483. The Kongo kingdom traded ivory, hides, and slaves for European firearms. By the early 1600s Portugal was exporting 5,000 to 10,000 slaves from Luanda every year, especially to Brazil. Portugal slowly expanded its control of Angola. Some Angolan leaders fought the Portuguese, but others worked with them. Portugal continued the slave trade in Angola until the mid-1800s.

In 1961 Angolans took up arms against Portugal, and violent fighting lasted for 14 years. The two main independence groups were the Popular Movement for the Liberation of Angola (MPLA) and the National Union for the Total Independence of Angola (UNITA). Cuban troops and Soviet arms supported the MPLA, while South Africa and the United States provided aid to UNITA.

Angola won independence in 1975. The MPLA gained control of the government. UNITA challenged its power, however, and fighting broke out. A devastating civil war lasted until the leader of UNITA died in 2002. After that, the MPLA had firm control of Angola. The country slowly rebuilt from the war.

Animal

Animals are living things. Like plants, animals need food and water to live. Unlike plants, which make their own food, animals feed themselves by eating plants or other animals. Animals can also sense what goes on around them. Their bodies allow them to move in reaction to their surroundings. They use their senses and movement to find food, mates, and safety.

Millions of different kinds of animals live on Earth. Animals are found throughout the world, from the freezing polar zones to the hottest deserts. They live on land and in the water. They come in a huge variety of shapes and sizes.

Scientists divide animals into two main groups. Animals that have a backbone are called vertebrates. Animals that do not have a backbone are called invertebrates. About 95 percent of all animals are invertebrates.

Invertebrates

Some invertebrates have a soft, unprotected body—for example, sponges, jellyfish, and worms. Most soft-bodied invertebrates have no legs. Many live in water, but some worms live on land.

Other invertebrates have a covering to protect their body. Animals called echinoderms—for example, starfish and sea urchins—have tough skin covered in stiff points. These animals all live in oceans. Many mollusks, including oysters and snails, have a hard shell around

Invertebrates

their soft body. Some mollusks live on land, but many live in water.

Invertebrates with jointed legs are called arthropods. They have a hard covering called an exoskeleton. Insects, spiders, crustaceans, and centipedes are all arthropods. Arthropods live on land and in water all over the world.

Vertebrates

Fish are the oldest known vertebrates. They live in water and are often covered in scales. Most fish have a bony skeleton. However, sharks and rays have a skeleton made of cartilage, a strong and flexible tissue.

Animals that live part of their life on land and part of their life in water are called amphibians. Frogs and salamanders are examples of amphibians. Most young amphibians live in water and breathe with gills. As they grow they form lungs and legs and move onto land.

The first vertebrates to live completely on land were reptiles—for example, lizards, snakes, and crocodiles. Reptiles have dry, scaly skin. Some reptiles, such as turtles, spend a lot of time in water, but they breathe air.

Vertebrates that have wings and feathers are called birds. Most, but not all, birds can fly.

Vertebrates that feed their babies with milk from the mother are called mammals. Mammals include mice, deer, seals, whales, monkeys, and humans.

Animals, Extinct

When an entire species, or type, of animal dies out, that species is extinct. Once a species becomes extinct, it is gone forever.

Causes of Extinction

The most common cause of extinction is a sudden, serious change in a species' habitat. A habitat is the surroundings in which an animal lives. Animals can rarely survive such sudden change. Their food supply may be wiped out. They may also lose shelter or other things that they need to survive.

Many things can change a species' habitat. Floods, fires, droughts, volcanoes, and other natural events may be causes. People also change the environment in ways that drastically affect animals. People clear forests and drain wetlands.

They build dams that disrupt the flow of rivers. They build cities on land that animals need to survive. They also create harmful pollution.

Some changes that cause extinction affect only a small area. Others are large enough to affect the entire world. A fire or other local event may cause the extinction of animals that live only in that region. A sudden change in the global climate might wipe out an animal species that lives in many parts of the world.

People can cause extinctions more directly as well. Some species have been hunted to extinction. The passenger pigeon is one example. Humans killed millions of the birds over many years. The last one died in the early 1900s.

Mass Extinctions

Sometimes many different species become extinct in a short time. This is

A bird called the dodo once lived on an island in the Indian Ocean. Europeans took control of the island in the 1500s and began to hunt the bird. By 1681 the dodo was extinct.

The Tasmanian wolf is an extinct animal. The last members of the species died out in the 1930s.

called a mass extinction. Several major mass extinctions have occurred in the past. Each time many animal species were wiped out. Some survived, however, and over millions of years new species developed.

The worst mass extinction happened about 248 million years ago. This extinction included mainly animals without backbones that lived in water. Another mass extinction occurred about 65 million years ago. It wiped out many of the planet's land animals, including the dinosaurs.

Dinosaur Extinction

Dinosaurs first appeared on Earth about 215 million years ago. They were the most important land animals for more than 150 million years. By 65 million years ago, however, the dinosaurs had died out.

Many scientists believe that a large asteroid, or rock from space, caused this mass extinction. When the asteroid hit Earth, the impact caused drastic changes. Thick dust and other materials blocked the sun. Temperatures dropped, and plants could not grow. The dinosaurs could not

survive the cold temperatures and lack of food. But early species of birds and mammals did survive.

Large Mammal Extinction

About 10,000 years ago another mysterious animal extinction occurred. This extinction was especially dramatic in North America, where many large mammals disappeared. Among them were woolly mammoths and saber-toothed cats.

Scientists do not know what caused this extinction. Some believe that growing numbers of human beings hunted and killed too many of the animals or their prey. Another theory is that the climate changed and affected the availability of food.

Endangered Species Today

In the past 200 years the world has lost many animal species. Hundreds of others are on the verge of extinction. Animals at risk of dying out are called endangered species.

Governments today are working to protect the world's endangered species. Laws protect some animals' habitats from being polluted or destroyed. Other laws make it illegal to hunt endangered animals. Some species respond well to these protective measures and increase in number. Others are not as successful.

Did You Know?

The Carolina parakeet and the passenger pigeon were birds once found in the United States. People killed so many of them that both types became extinct in 1914.

Animals, Legendary

Stories about unusual animals were commonplace in earlier times. Such animals are called legendary because they exist only in these stories, or legends. The stories were often based on travelers' reports of animals that were unfamiliar to them. Some famous legendary animals include the dragon, various sea serpents, the unicorn, and the phoenix. Even today some people speak of having seen animals such as the yeti, Bigfoot, and the Loch Ness monster.

The Dragon

The dragon was usually thought of as a huge scaly lizard or snake that breathed fire and had wings like a bat. In the Middle Eastern world, the serpent or dragon symbolized evil. In Christian art the dragon came to stand for sin. In China, however, the dragon is known as a kind creature.

A sculpture of a dragon decorates a tiled wall in Beijing, China.

Mermaids have appeared in many stories, including "The Little Mermaid" by Hans Christian Andersen.

Sea Creatures

Sea serpents were supposed to be enormous snakes, or huge creatures that inhabited the deep sea. Sailors throughout the ancient world reported having seen such creatures. In Norwegian sea folklore, the kraken was a huge creature, part octopus and part crab. Accounts of these creatures might have been based on sightings of giant squid, which can reach a length of 60 feet (18 meters).

Mermaids were also mythical sea creatures. They were thought to have the head and upper body of a woman and the tail of a fish. Stories of mermaids may have come from people who saw water-dwelling mammals, such as the dugong and manatee. These animals feed their young in human fashion

above water and from afar may have looked like a person.

The Unicorn

A tapestry made in the 1400s shows a unicorn with a large horn.

The unicorn was a mythological animal with a single horn on its forehead. Its body shape resembled a horse or a young goat. The unicorn was referred to in the ancient myths of India and China. It appears in artwork from the ancient civilization of Mesopotamia. During the Middle Ages (about AD 500–1500) artists from Europe, the Islamic world, and China included the unicorn in their artwork as well.

The Phoenix

Mythological creatures also have taken the form of birds. A fabulous bird known as the phoenix was associated with the worship of the sun in ancient

Egypt. It was said to be as large as an eagle, with brilliant scarlet and gold feathers. Legend had it that only one phoenix existed at any one time and that it lived at least 500 years. As its death approached, the phoenix made a nest. It then set the nest on fire and was consumed in the flames. A new phoenix miraculously emerged from the ashes.

Modern Creatures

Some people have claimed to have seen a “monster” in Loch Ness, a lake in northern Scotland. No one has ever proved the monster’s existence, however.

More recent legendary creatures are the Abominable Snowman and Bigfoot. The Abominable Snowman, or yeti, is a monster thought to live in the Himalayan mountain range. Reports of the monster are based mostly on mysterious markings in the snow. Many people think that the markings come from bears. Bigfoot, or Sasquatch, has been described as a large, hairy creature resembling a human. It is believed by some to exist in the northwestern United States and western Canada.

Animation

Animation is the art and science of making pictures, or images, appear to move. Animated movies and television shows are popular forms of entertainment. There are two basic types of animation: traditional animation and computer animation.

Did You Know?

The mermaid is not the only legendary creature with a human head and an animal body. The centaur has the body of a horse, and the sphinx has the body of a lion.

Traditional Animation

Movies and television shows made with traditional animation are also called cartoons. Teams of artists create them one picture at a time.

To create an animation an artist draws the same character many times. In each drawing the character has changed position slightly.

Thousands of drawings are needed for only a few minutes of animation. Each drawing is a bit different from the one before it. For example, to show a character walking, the first drawing might show the character with both feet on the ground. The next drawing might show the knee with a tiny bend and the foot slightly off the ground. In the third drawing, the knee might be bent more and the foot might be a little farther off the ground, and so on.

To save work and time, artists paint or draw the moving parts of a scene on sheets of clear plastic film. They place a drawing of the parts of the scene that do

not move under the clear film. In this way they do not need to redraw the background in every picture.

Then filmmakers use a special camera to take a picture of each drawing on its background. Each of these pictures is called a frame. The camera records the frames one after another on long strips of film. To make the images move smoothly, 24 frames are needed for every second of film.

Filmmakers can also create animation with figures made of clay or other materials. Instead of drawing thousands of images, they take many photographs of figures set up in a scene. They move the figures slightly between each photograph. This technique is called stop-motion animation.

Computer Animation

Computers have made animation a faster process. They can produce the

Artists used computers to make the animated movie *Toy Story* in 1995.

thousands of pictures needed for an animated film more quickly than human artists. Artists can also use computers to create characters, objects, and backgrounds that look more real than drawings do. Today computers are used in almost all animation.

Computer animation can be used to make a whole movie or to create special effects in live-action films. Many spacecraft, robots, and monsters in movies are actually computer images.

Computer animation can be used for more than just entertainment. Scientists use computer animation to show things that people cannot easily see in real life. Such things include the movement of the solar system, weather patterns, and the inside of the human body.

History

In the 1800s people invented spinning machines that made a series of drawings appear to move. The first animated films appeared in the early 1900s. Walt Disney made the first animated film with sound, *Steamboat Willie*, in 1928. In 1937 Disney made *Snow White and the Seven Dwarfs*. It was the first full-length animated film to be released as a major motion picture in the United States. Animated television shows appeared in the United States in the 1950s. *Toy Story*, from 1995, was the first long film made completely with computer animation.

Ankara

Population
(2007 census)
3,763,591

Ankara is the capital of the country of Turkey. The city is located in the part of Turkey that lies in southwestern Asia, called Asia Minor. Ankara is Turkey's second largest city, after Istanbul.

Ankara is one of Turkey's main industrial centers. Its factories produce wine and beer, processed foods, decorative flooring, construction materials, and tractors. Tourism and other service industries have expanded rapidly in the city.

People have lived in the Ankara area for many thousands of years. In 334 BC Alexander the Great conquered Ankara. The city later became part of the Roman Empire and then the Byzantine Empire.

Mustafa Kemal is buried in a mausoleum, or tomb, in Ankara.

Ankara was part of the Ottoman Empire from the 1400s to the early 1900s. In 1919 the Turkish leader Mustafa Kemal set up a rival government in Ankara. He wanted Turkey to become its own country. Turkey became an independent republic in 1923, and Ankara became its capital.

Annapolis

Population

(2000 census)
35,838; (2007
estimate)
36,603

Annapolis is the capital of the state of Maryland. The city lies along the Severn River at its mouth on Chesapeake Bay.

Annapolis has a port on the bay, which leads to the Atlantic Ocean.

Many people in Annapolis work for the state government. The United States Naval Academy in Annapolis trains officers for the Navy and Marine Corps. The city's leading industries are crab and oyster fishing, seafood processing, and boatbuilding.

The city was founded in 1649. It was originally called Providence. The city became the capital of Maryland in 1694. The following year the city was renamed Annapolis.

In the 1700s Annapolis was an important center of social and political life in the American Colonies. It served as the capital of the United States from 1783 to 1784. Many historic buildings from the 1700s can still be seen in Annapolis today.

Saint Mary's Church was built between 1858 and 1860. It is located on Spa Creek in Annapolis' historic district.

Ant

Ants are social insects. This means that they live together in organized communities called colonies. There are more than 10,000 different species, or kinds, of ant. Ants are found almost everywhere in the world, but they are most common in hot areas.

Ants range in size from 0.08 inch to 1 inch (2 to 25 millimeters). They are usually yellow, brown, red, or black. The body of an ant is divided into three sections: the head, the thorax (midsection), and the abdomen. The head is large, and the abdomen is slender and oval. The thorax is connected to the abdomen by a small waist. Two antennas are located on the top of the head. Ants use their antennas for guidance, smell, and communication.

Most types of ant live in nests that they make from many different materials,

Harvester ants work to store grass, seeds, and berries in their nest.

Carpenter ants like wood of all kinds. They make their nests in live or dead trees or in wooden structures such as telephone poles and porches.

including soil, sand, wood, and leaves. Some ants build anthills. Within each nest there is usually a queen, workers, and soldiers. The queen spends her life laying eggs. The workers are females who do the work of the nest—for example, collecting food, cleaning the nest, and caring for eggs. Soldiers are larger females who defend the colony. They also raid other colonies and often capture slaves.

At certain times of the year, many species produce winged males and queens. The males' only purpose is to mate with the queens. The males and the queens fly into the air to mate. The males die soon afterward. Each queen then lays her eggs and sets up a new nest. It takes several weeks for the eggs to develop into adults. Most ants live for 6 to 10 weeks, though some live up to 15 years.

Insect

Antananarivo

Population
(2001 estimate)
1,403,449

Antananarivo is the capital of Madagascar, an island country off the southeastern coast of Africa. Antananarivo stands on a high hill in the country's central highlands. It is the largest city in Madagascar by far.

Antananarivo's historic sites include royal palaces from the 1800s. The city also has Anglican and Roman Catholic cathedrals and the National Library. The University of Madagascar was opened in the city in 1961.

Antananarivo has been a government center for hundreds of years. Many of the city's residents work for the government of Madagascar. Banking and business services are also important to the economy. The city's factories process tobacco and make foods, leather, and clothing.

Antananarivo began as a fortress town in the 1600s. It became the capital of the Merina kingdom in the 1700s. In 1895 French troops took control of the town. Within 10 years the French controlled most of the island. They made the town the capital of their colony. In 1960 the colony became an independent country with its capital at Antananarivo. The city grew quickly in the late 20th century.

Antarctica

The southernmost continent in the world, Antarctica surrounds the South Pole. Its name means “opposite to the Arctic” (the Arctic is the region around the North Pole). Antarctica is larger than both Europe and Australia. But it has no permanent human population.

Land

An ice sheet covers nearly all of Antarctica. It contains 90 percent of the world’s ice and 70 percent of the world’s freshwater. At its thickest point the ice sheet is 15,670 feet (4,776 meters) deep. Around the coast, glaciers continually break off icebergs into the sea.

The continent has two unequal parts. The larger is generally known as East

Antarctica, while the smaller is West Antarctica. West Antarctica includes the Antarctic Peninsula, an 800-mile (1,300-kilometer) extension of the continent that juts northward toward the southern tip of South America. The Transantarctic Mountains separate East and West Antarctica. Mountains with only their peaks showing through the ice, known as nunataks, are found in some areas. Antarctica has several active volcanoes.

About 2 percent of Antarctica is ice-free. These unusual land areas, called oases, are mostly found near the coast. They include the dry valleys of southern Victoria Land and the Bunger Oasis in Wilkes Land.

Penguins are among the few animals that can survive the very cold temperatures of Antarctica.

Antarctica does not have 24-hour periods divided into days and nights. At the South Pole the sun rises on about September 21 and moves in a circular path until it sets on about March 22. This “day,” or summer, is six months long. From March 22 until September 21 the South Pole is dark, and Antarctica has its “night,” or winter.

Antarctica is the coldest continent. The average annual temperature in the interior is -70°F (-57°C). But the coast is warmer. Along the Antarctic Peninsula temperatures can rise up to 59°F (15°C).

Plants and Animals

The extreme cold has kept the continent almost empty of life. Some mosses and liverworts grow in ice-free areas along the coast, and two types of flowering plants grow on the peninsula. Native land animals are limited to certain kinds of arthropods, or insectlike animals.

About 45 kinds of birds live in Antarctica. The emperor and the Adélie penguins are found in large numbers around the entire coastline. Gentoo and chinstrap penguins occupy the Antarctic Peninsula coasts and some islands. Several kinds of seals and whales inhabit the waters around Antarctica. Fishes limited to the Antarctic include the Antarctic cod and the icefish.

History

The first recorded landing on Antarctica was on Cape Adare in 1895. The first people to spend a winter on the conti-

Facts About ANTARCTICA

Population	No permanent population
Coldest Recorded Temperature	July 21, 1983, Vostock Station: -129°F (-89°C)
Hottest Recorded Temperature	January 5, 1974, Lake Vanda: 59°F (15°C)

ment did so in a ship that was caught in ice at Cape Adare during the period from March 1898 to March 1899. Englishmen Robert F. Scott and Ernest Henry Shackleton led three expeditions to the Antarctic between 1901 and 1913. They pioneered routes into the interior of the continent, and the research they conducted provided a base for present-day scientific programs. On December 14, 1911, Roald Amundsen of Norway became the first person to reach the South Pole. Many other expeditions followed.

Every year hundreds of researchers travel to Antarctica to conduct experiments. Widespread scientific investigation of Antarctica began during the International Geophysical Year in 1957–58. In 1959, 12 countries signed the Antarctic Treaty to reserve the continent for peaceful, scientific purposes. By 2000, 44 countries had signed the treaty.

Anteater

Anteaters are curious-looking animals. Their long heads and snouts look like tubes, and they have no teeth at all. Anteaters use their strong front legs and heavy claws to break open nests of ants and termites. When the insects rush out, the anteaters eat them with their long, sticky tongues.

Anteaters live in the swamps and forests of Central and South America. They are related to sloths and armadillos, which also live in Latin America.

True Anteaters

There are four species, or types, of anteater. They make up a scientific group called *Vermilingua*, which means “worm-tongue.”

The largest species is the giant anteater. From the tip of its snout to the end of its tail, the giant anteater is about 6 feet (1.8 meters) long. Its coat is mostly gray, and its long tail is bushy. It feeds on the ground by day and by night.

There are two different species of lesser anteater, or tamandua, but they look very similar. Lesser anteaters are only about half the length of giant anteaters. They also have shorter muzzles. Lesser

anteaters have tan, black, or tan-and-black coats. They live in trees and feed at night. They use their long, nearly hairless tails to climb on tree branches.

The silky, or two-toed, anteater is the smallest of the group. It is the size of a squirrel. It has a silky, yellowish coat and a long, furry tail. Like lesser anteaters, the silky anteater lives in trees and feeds at night.

Other Animals Called Anteaters

People sometimes call other insect-eating animals anteaters, but these animals are not related to true anteaters. They include the numbat (or banded anteater), the armadillo (or ant bear), the echidna (or spiny anteater), and the pangolin (or scaly anteater).

Armadillo • Sloth

Antelope

Antelopes are a group of plant-eating mammals that belong to the same family as sheep, goats, and cattle. The impala, the addax, gazelles, gnus, and kudus are all antelopes. The pronghorn, or prongbuck, is also known as an antelope, but it belongs to a different family.

Antelopes live on the large, grassy plains of Africa and in the central and southwestern regions of Eurasia (the continents of Europe and Asia). Only the pronghorn is found in North America.

Did You Know?

The giant anteater's tongue can be as long as 24 inches (60 centimeters).

giant anteater

There are many different kinds of antelope. They include the blackbuck, which is found in India; the saiga from elsewhere in Asia; and the gerenuk, Thomson's gazelle, common eland, impala, and suni from Africa. In most of these animals only the males have horns.

Antelopes are generally about the same size as most goats and deer. They have hooves on their feet. Their coats are generally golden, reddish tan, or gray. The face, belly, and rump tend to be white. Most male antelopes have horns that curve backward.

Antelopes have excellent senses of smell and hearing. These help them to detect danger and leap to safety. The impala can make leaps as long as 30 feet (9 meters). Antelopes can also run very fast. One type of gazelle can run 50 miles (80 kilometers) per hour.

Antelopes generally travel in herds of several hundred animals. During the mating season, male antelopes mark their territory by rubbing their scent glands against plants and trees. A male will fight other male antelopes to defend his territory. The male then attracts a

female, or doe, and they mate. The doe gives birth to one young about four to eight months later, depending on the type of antelope.

Anthem, National

► see National Anthem.

Anthony, Susan B.

In the 1900s women in the United States fought to gain equal rights with men. One of the leaders of that movement was Susan B. Anthony.

Susan B. Anthony

Susan Brownell Anthony was born on February 15, 1820, in Adams, Massachusetts. When she was 6 years old her family moved to Battenville, New York. As a young woman she taught school.

In the 1850s Anthony became involved in both the temperance movement, which fought alcohol abuse, and the abolitionist movement, which sought to end slavery. She traveled widely, spoke at public meetings, and began to take an interest in women's issues.

At the time, women in the United States did not have the right to vote. To fight this injustice, Anthony and her friend Elizabeth Cady Stanton formed the National Woman Suffrage Association (NWSA) in 1869. "Suffrage" means the right to vote.

To draw attention to the struggle, Anthony tried to vote in the 1872 presidential election. She was arrested, but she refused to pay her fine. In 1890 the

NWSA merged with another group to form the National American Woman Suffrage Association. Anthony was president from 1892 to 1900.

Susan B. Anthony died on March 13, 1906, in Rochester, New York. In 1920 the 19th Amendment to the U.S. Constitution gave voting rights to women in all states.

Anthropology

Some anthropologists study how certain groups of people live. They may travel to remote places, such as the Ituri Forest in central Africa, to observe these groups.

Anthropology is the study of human beings and their cultures, from prehistoric times to today. The people who practice anthropology are called

anthropologists. Anthropologists often compare different human communities. They try to determine their similarities and differences. By doing this, anthropologists hope to increase their knowledge about humanity as a whole, as well as about specific groups of people.

Anthropology has two main divisions: physical and cultural. Physical anthropologists study the physical features of humans. Cultural anthropologists examine human cultures. Both these kinds of anthropology may include the study of prehistoric, ancient, and modern humans.

Physical Anthropology

Physical anthropology is related to the science called biology. Physical anthropologists examine differences in human physical features. They often study human genes. These are the things that pass along traits from parents to their children. They may also measure the shape, size, and structure of body parts or properties such as blood types.

Some anthropologists study the bones and other remains of humans.

Some physical anthropologists compare the physical features among people from different geographic areas. Others may examine what makes humans physically different from other animals, such as apes. Some physical anthropologists study the remains of prehistoric humans to learn about human origins. They try to determine how and when modern humans developed from early forms of humans and from nonhuman ancestors. In other words, they study human evolution.

In the past, some physical anthropologists divided people into races. They ranked the races based on such features as skull size and skin color. They thought that some races were better than others. However, that idea came from prejudices, not from true science. In the late 20th century anthropologists found that modern humans are all very similar in their genes. In fact, there is no scientific basis for dividing people into races.

Cultural Anthropology

Cultural anthropology is a social science, or a field of study concerned with human societies. Cultural anthropologists study many aspects of human cultures, in different places and times. These may include art, language, religion, clothing, customs, and social structure. Anthropologists try not to judge a culture's practices as good or bad. Instead, they try to find out what the practices mean to the people of that culture. They also compare the practices of various societies.

Did You Know?

Margaret Mead of the United States was a famous anthropologist. She studied the peoples of Oceania during the mid-1900s.

Archaeology is one type of cultural anthropology. Archaeologists uncover and study pottery, tools, and other objects left by prehistoric and ancient peoples. They try to learn how such peoples lived.

In the 1800s and early 1900s most cultural anthropologists were from western Europe or the United States. They usually traveled to another part of the world, such as Africa or Asia, to study different cultures. Today cultural anthropologists from all around the world study a wide variety of human groups. For instance, they may study small fishing villages, gangs in big cities, religious groups, or large companies.

Antibiotic

Doctors sometimes treat patients with a type of medicine called an antibiotic. Antibiotics treat illnesses and infections caused by bacteria, or tiny organisms. Antibiotics can come in the form of a pill, a liquid, a cream, or a shot. One of the first widely used antibiotics was penicillin. It was discovered in 1928.

Doctors use antibiotics to cure serious diseases such as pneumonia, tuberculosis, and meningitis. Antibiotics can also fight common problems such as acne and strep throat. Antibiotics do not work against common colds or other illnesses caused by a virus.

Did You Know?

Antibiotics should always be used carefully. Some people have bad reactions to certain antibiotics.

A special test shows whether or not antibiotics can stop the growth of certain bacteria. Tablets that contain antibiotics are placed on a surface with bacteria on it. The clear areas around the tablets show that the antibiotics have stopped the bacteria from growing.

Antibiotics work by killing bacteria or by preventing them from multiplying. Sometimes, however, not all the bacteria die. The bacteria that survive are said to have a resistance to the antibiotic. As those bacteria multiply, they pass on the resistance to new bacteria. The next time those bacteria are exposed to the same antibiotic, even fewer of them die. Eventually the antibiotic does not kill enough of the bacteria to make the illness go away.

When enough types of bacteria become resistant to an antibiotic, doctors no longer use that antibiotic as medicine. The number of resistant bacteria continues to grow. Scientists are working to find new antibiotics to replace the old ones.

Antigua and Barbuda

The Caribbean island country of Antigua and Barbuda is known for its powdery beaches. The capital is Saint John's.

Geography

The country consists of three islands: Antigua, Barbuda, and Redonda. Antigua has rolling hills and volcanic rocks. Near the coast are coral reefs. Barbuda is a flat island 25 miles (40 kilometers) north of Antigua. No one lives on Redonda, a large rock southwest of Antigua.

The country has a warm, tropical climate. Droughts often occur on Antigua.

Plants and Animals

Barbuda has rain forests and lush vegetation. With its drier climate, Antigua has no forests but many kinds of cactus. Barbuda is home to many large seabirds called frigate birds.

People

Most of the country's people are descendants of African slaves. Small populations of whites, Asians, and American Indians also live there. Most people are Christian. The official language is English.

Economy

Tourism is very important to Antigua and Barbuda's economy. Transportation, communications, financial services, real estate, and construction are also important. There is little manufacturing,

mainly of beer and T-shirts. Agriculture and fishing play a small role in the economy. The main crops are tropical fruits.

History

The first inhabitants of Antigua and Barbuda were the Ciboney people and, later, the Arawak people. The explorer Christopher Columbus landed on Antigua in 1493.

The English took over the islands in 1632. They brought in Africans to work as slaves on large sugar plantations. The slaves won freedom in 1834.

The islands were part of the British Leeward Islands colony until 1956. Great Britain then managed their foreign affairs until 1981, when Antigua and Barbuda gained independence.

Apache

The people known as the Apache include several related Native American groups. The Apache are familiar to many people because of the Wild West stories about Cochise and Geronimo. Both men were famous Apache warriors who fought to keep Apache lands free from Mexico and the United States.

Historians believe that the ancestors of the Apache lived in Canada. The Apache probably migrated to the American Southwest in about AD 1000. The traditional Apache homelands are located in what are now Arizona, Colorado, New Mexico, Texas, and the Mexican states of Chihuahua and Sonora.

The Apache were nomads who moved from camp to camp depending on the season and the food supply. They got their food by hunting, gathering wild plants, and farming. They also carried out raids on other people to obtain

An Apache woman holds a child in a cradleboard. Many Native American women used cradleboards to carry small children on their back.

horses and supplies. The Apache made dome-shaped shelters, known as wicki-ups, by covering a wooden frame with grass or branches.

Spanish explorers were the first non-Indians to enter Apache lands. Mexicans and Americans came later. American settlement in Apache territory led to fierce fighting between the Apache and the U.S. military in the second half of the 1800s. The last of the Apache wars ended with Geronimo's surrender in 1886. Some of the Apache settled in Oklahoma; others moved to a reservation in New Mexico. At the end of the 20th century there were about 57,000 Apache. Many lived on reservations in the Southwest.

Apartheid

Apartheid was a system for keeping white people and nonwhites separated in South Africa. It lasted from about 1950 to the early 1990s. The word apartheid means “apartness” in Afrikaans, a language spoken in South Africa.

The population of the country is mostly nonwhite. But for many years the white people of South Africa controlled the country's government. They established laws that kept the races separate and discriminated against the nonwhite majority.

Apartheid divided South Africans into four groups: white, Bantu (black), Col-

During the period of apartheid blacks and whites were kept apart in many ways. A sign from that time says that a beach is for whites only.

ored (of mixed descent), and Asian. The policy created separate areas in cities for each group. Members of a group were not allowed to live, operate businesses, or own land outside of their area. Under “pass” laws, nonwhites had to carry passes while in white areas. Other laws set up separate schools and restricted each race to different types of jobs. The government also created 10 territories called “homelands” and forced all blacks to move to them.

With the support of some whites, many blacks in South Africa protested against apartheid. The African National Congress (ANC) led the fight. The protests sometimes turned violent. A district called Soweto rioted in 1976 against a requirement that blacks learn Afrikaans. Other countries also condemned apart-

heid. In 1985 Great Britain and the United States restricted trade with South Africa.

In response to the protests, the South African government granted nonwhites some rights in the late 1980s. In 1990–91 the government led by President F.W. de Klerk ended most of the apartheid laws. In 1994 all races were allowed to vote in a national election. Nelson Mandela, leader of the ANC, was elected president. Apartheid was over, but its effects remained. Racial discrimination continued in South Africa.

Apatosaurus

A massive dinosaur, the *Apatosaurus* weighed as much as five elephants. The name *Apatosaurus* means “deceptive lizard.” It used to be called *Brontosaurus*, which means “thunder lizard.” *Apatosaurus* belongs to the group of dinosaurs known as sauropods, which also includes *Brachiosaurus*. The sauropods were large, plant-eating dinosaurs with a long neck, a massive body, and four pillarlike legs.

When and Where *Apatosaurus* Lived

Apatosaurus lived about 147 to 137 million years ago. Most *Apatosaurus* remains have been found in North America,

Did You Know?

Scientists once thought that *Apatosaurus* needed to live in water to support the weight of its heavy body. Modern scientists now agree that the dinosaur was mainly a land animal.

Apatosaurus

particularly in Wyoming, Utah, Oklahoma, and Colorado.

Physical Features

Apatosaurus was one of the largest land animals of all time. It reached a length of 70 feet (21 meters), weighed 30 to 36 tons, and stood 15 feet (4.6 meters) tall at the hips. This dinosaur also had a very long neck and tail. *Apatosaurus* stood and walked on all four legs. It had claws on its large feet. Its head was small and horselike, with long, peg-shaped teeth.

Behavior

Apatosaurus fed on the leaves and needles of trees and plants. Its long neck may have let it reach trees as high as 35 feet (10.6 meters). It swallowed small stones to help grind up the plants in its stomach. *Apatosaurus* probably lived and traveled in herds. Like other dinosaurs, it reproduced by laying eggs.

Ape

Apes are the animals that are most closely related to humans. Both apes and humans are members of the scientific group of animals called primates. Monkeys are primates, too. However, apes differ from monkeys in several ways. For instance, apes have more complex brains than monkeys do. Also, monkeys have tails but apes do not.

The apes are divided into two categories: great apes and lesser apes. Gorillas, orangutans, chimpanzees, and bonobos are great apes. They are larger and more intelligent than the lesser apes. The gibbons are lesser apes.

Where Apes Live

Apes live in warm or hot rain forests. Gibbons and orangutans are found in southeastern Asia. Gorillas and chimpanzees are found in western and central Africa. Bonobos have the smallest range. They are found only in part of the

Apes include orangutans, gorillas, bonobos, and gibbons. They vary in size, but some of them can be as big as an adult human.

Democratic Republic of the Congo, a country in central Africa.

Gibbons and orangutans live mainly in trees. On the other hand, gorillas spend most of their time on the ground.

Chimpanzees and bonobos tend to eat and sleep in trees, but they travel mostly on the ground.

Physical Features

The smallest apes are the gibbons. Most gibbons are about 16 to 26 inches (40 to 65 centimeters) long. Gorillas are the largest apes. They may grow to about 66 inches (170 centimeters) in length and

weigh 300 to 600 pounds (135 to 275 kilograms).

All apes have a coat of hair, which is usually tan, brown, black, gray, or reddish. They have long arms and shorter legs. Gorillas, orangutans, and chimpanzees generally have powerful arms and broad chests. Bonobos and gibbons are more slender. Like humans, all apes have thumbs that can bend to meet the other fingers.

Behavior

Most apes are active during the day. They usually sleep in trees at night. All

apes except gibbons build nests for sleeping.

Most apes live in groups. Chimpanzees and bonobos are the most social, sometimes living in groups of more than 100 animals. However, male adult orangutans live mostly alone.

Apes eat mainly plants, including fruits, leaves, stalks, and seeds. Sometimes they eat insects or other small animals. Chimpanzees also hunt and kill monkeys and other mammals for food.

Great apes are very intelligent. Some chimpanzees and orangutans in the wild use sticks or other objects as tools. For instance, some chimpanzees poke sticks into ant or termite nests. The chimps pull the sticks out and eat the insects clinging to them. Scientists study the learning abilities of apes in laboratories and zoos. They have taught some great apes to communicate using sign language or pictures of symbols. However, not all scientists agree that these apes have truly learned to use language.

Some apes spend part of their time in trees and part on the ground. Orangutans, like gibbons, spend most of their time in trees.

Reproduction

Reproduction in apes is similar to reproduction in humans. A female ape usually gives birth after a pregnancy of seven to nine months. Normally a single baby is born. Twins are rare. Baby apes are nearly helpless for the first few months after birth. Adult apes may provide care for the young for several years.

Under Threat

Most types of ape are endangered, or at risk of dying out completely in the wild. Humans have cut down the trees in forests where some apes live, destroying their habitats. People also kill apes for their meat. However, people have also begun trying to save these animals. Some countries have national parks to protect apes and their habitats. Laws also make it illegal to hunt or capture endangered apes.

Aphrodite

In ancient Greek mythology Aphrodite was the goddess of love and beauty. She was one of the 12 chief gods believed to live on Mount Olympus. Aphrodite is associated with the Roman goddess Venus because they shared many of the same characteristics. The symbols of Aphrodite are the dove, rose, myrtle tree, and swan.

In one story Aphrodite was the daughter of Zeus, the ruler of all the gods. Her mother was a Titan named Dione.

Titans were giants who once ruled the world. Other stories tell that Aphrodite sprang fully grown from the foam of the sea. The wind carried her on a shell to the island of Cyprus, which became her home. Sailors prayed to her to calm the wind and waves.

According to legend, gods and humans alike desired Aphrodite because of her

beauty. But she was proud and rejected her admirers. To punish her, Zeus had her marry the ugly god of fire, named Hephaestus. Aphrodite soon left him for Ares, the handsome god of war. One of their children was Eros, the winged god of love. Zeus later arranged for Aphrodite to fall in love with a handsome shepherd named Anchises. From that union Aeneas was born. He was said to be an ancestor of the Roman people.

Apia

Apia is the capital of Samoa, an island country in the southern Pacific Ocean. It lies on the northern coast of Upolu Island. Apia is Samoa's main port. It ships dried coconut meat, bananas, cocoa, and coffee to other countries. Manufacturing and tourism also bring money to the city.

Apia developed into a port after European missionaries and traders arrived in the mid-1800s. In the 1940s, during World War II, U.S. Marines used Apia as a base.

The former home of Scottish writer Robert Louis Stevenson sits on a hill overlooking Apia. Today Samoa's head of state lives there.

Apollo

In ancient Greek mythology Apollo was the god of music, healing, light, and prophecy (predicting the future). He was one of the 12 main gods believed to

live on Mount Olympus. He also came to be considered a sun god. Because of Apollo's many important roles, the Greeks loved him greatly. The Romans later worshipped him too. The laurel tree, dolphin, and crow were sacred to Apollo.

Apollo was the son of Zeus, the chief god, and Leto. Leto was a Titan, or one of the giants that once ruled the world. Apollo was also the twin brother of Artemis, the goddess of hunting.

According to tradition, one of Apollo's earliest deeds was to slay a giant snake, called Python. No human dared approach the monster. Apollo came down from Mount Olympus and, after a hard fight, killed Python using his silver bow and golden arrows.

The famous Temple of Apollo stood at a site called Delphi. This was near the place where Apollo had killed Python. People traveled great distances to visit the shrine. There they would speak to one of Apollo's priestesses. She would give them an oracle, or prediction of the future, said to come from Apollo.

According to legend, the god Hermes gave Apollo a lyre (a kind of stringed instrument). Apollo loved the gift and became skilled at playing it. With his music, Apollo charmed the other gods at feasts on Mount Olympus.

Appalachian Mountains

The Appalachian Mountains of eastern North America are lower but much older than the Rocky Mountains in the West. For early settlers who wanted to move from the territory of the original 13 American Colonies to the west, the Appalachians were a natural barrier.

The Appalachians extend almost 2,000 miles (3,200 kilometers), from the Canadian province of Newfoundland and Labrador in the north to the U.S. state of Alabama in the south. The mountains are more than 250 million years old and have been worn down over the years.

Because they extend so far north and south, the Appalachians have a wide range of temperatures. In Canada and in the White Mountains of New Hampshire, Arctic conditions often prevail, especially at high elevations. The south

has milder weather, but heavy clouds and haze are common.

Before settlers arrived from Europe, the Appalachian area from Maine to Georgia was completely covered by forests. The forested area is now smaller but still impressive. Hawks, wild turkeys, and many kinds of songbirds make the Appalachians their home. The region also has black bears, white-tailed deer, wild boars, raccoons, and beavers.

Before the arrival of Europeans, the northern part of the Appalachians was occupied by Native Americans of various Eastern Woodland groups. In the southern mountains, the Cherokee were the main inhabitants. By the middle of the 1800s, most of the Native Americans had been removed from the area. In the south, they were replaced by settlers who lived in isolated communities. Separated from the outside world by the hills,

Screw Auger Falls are in a section of the northern Appalachian Mountains in Maine.

Did You Know?

The highest peak in the Appalachian Mountains is Mount Mitchell in North Carolina. It reaches a height of 6,684 feet (2,037 meters).

these people made their own distinctive culture and music.

Eastern Appalachia has rich farmland. Cotton is grown in the south, while tobacco and fruit are the main crops farther north. The Appalachian area is also known for its minerals. Coal is the most important mineral. It is mined in large quantities in the Appalachian Plateau, from Pennsylvania to Alabama.

Tourism is also a major industry. The Appalachians offer splendid scenery and many opportunities for outdoor activities. The Appalachian National Scenic Trail is a hiking path that winds through 14 states on its way from Mount Katahdin, in Maine, to Springer Mountain in Georgia.

Appendix

The appendix is a part of the human digestive system. It is a finger-sized tube attached to the large intestine. The appendix does not seem to help with digestion. However, if it becomes

blocked or infected, it can cause an illness called appendicitis.

Human beings are one of the few animals that have an appendix. The human appendix is usually 3 to 4 inches (8 to 10 centimeters) long. It is less than half an inch (1.3 centimeters) wide. It extends outward from the first section of the large intestine, in the right side of the lower belly.

Appendicitis usually occurs in people younger than 35 years of age. The illness happens when something (such as digestive waste) blocks the opening of the appendix. The appendix then swells and becomes infected. If swelling continues, the appendix may burst.

An attack of appendicitis usually starts with a dull pain in the belly. Within hours the pain may worsen. The pain may move downward, to the right side of the lower belly. Nausea and vomiting are also common.

Doctors treat appendicitis by removing the appendix. The surgery to remove an appendix is called an appendectomy.

Apple

Apples are one of the world's most widely grown fruits. People have eaten them since ancient times. There are thousands of varieties of apple. They grow on trees that belong to the same scientific family as roses.

Apples vary in size, color, and texture.

Where Apples Grow

People grow apples in North America, Europe, and Asia. The leading producers of apples include China, the United States, Poland, Iran, Turkey, and France. Apple trees grow best in areas where the summers are mild and the winters are somewhat cold.

Physical Features and Growth

Apple trees are small to medium in size. In the spring they grow white flowers. The fleshy fruits are usually ready to be picked in autumn. Apples are red, yellow, or greenish and fairly round. They are about 2 to 4 inches (5 to 10 centimeters) wide.

A new apple tree can grow from an apple seed. However, it will not grow the same variety of apple as the tree that made the seed. Because of this, people normally grow apple trees using another method. They cut a twig or bud from the apple tree to be reproduced. They attach this twig or bud to a rootstock, or a young apple tree grown for its strong roots. The parts from the two trees soon grow together into one tree. This new tree will

produce the same variety of apple as the one from which the twig or bud came.

Uses

Apples contain fruit sugars, fiber, and the vitamins A and C. Some varieties are good for eating raw. Other types are best cooked. In the United States apple pie is a traditional dessert. In Europe people often serve fried apples with sausage or pork. Farmers grow some varieties of apple for their juice. People drink the juice fresh or make it into a drink called cider.

Apricot

Apricots are orange or reddish fruits with smooth skin. The trees on which they grow belong to the rose family. Apricots are related to plums and peaches.

Apricots originally grew only in China. They were carried to other parts of the

Apricots are golden ripe and ready to pick in June and July, earlier than most other fruits.

world, and today they grow in all of central and southeastern Asia. They are also found in parts of southern Europe, North Africa, and North America. Turkey is the world's largest producer of apricots. California produces almost all the apricots in the United States.

Apricots are round or oval in shape. They are usually less than 3 inches (8 centimeters) wide. Most apricots have orange or yellow flesh. Some kinds have nearly white flesh. Apricots have a large, flat, smooth seed in the center. The seed is also called a pit, or stone.

Apricots grow on large, spreading trees with bright green, oval leaves. Apricot trees produce small white or pink flowers in spring. The fruits grow from these flowers. The fruit develops slowly at first. After the pit forms, the fruit grows more quickly. Apricots are ready to pick in early summer.

Fresh apricots taste sweet and mild. Most apricots are dried, canned, or made into jam. They are a good source of vitamin A and iron.

Aquarium

An aquarium can be a small container for a few goldfish. It can also be a building that displays a large collection of water animals. Aquariums give people the chance to observe an ecosystem very different from their own.

Types of Aquariums

People who like fish often keep aquariums as a hobby. Popular fish for home aquariums include goldfish, guppies, zebra danios, and bettas. Home aquariums can be as small as a bowl or as large as an entire wall. For their fish to sur-

Orca whales swim past visitors to a public aquarium.

vive, owners must make sure that their aquariums stay clean and that the water is at the right temperature. They also must provide the right type and amount of food.

Public aquariums are buildings with large tanks of fish and other water animals. Different tanks contain fish, animals, and plants from cold, warm, fresh, and salty waters. People come to see and learn about fish and their habitats. Public aquariums often care for sick or injured water animals, too. Marine biologists help the animals to get well and then return them to the wild.

History

People have kept fish in artificial habitats for at least 4,500 years. The ancient Egyptians and Romans kept fish in

aquariums. The Chinese bred goldfish in ponds and bowls. Artificial ponds filled with fish later became popular in European gardens. The trend spread to North America in the 1800s. In 1853 the Zoological Society of London, England, opened the first public aquarium. Public aquariums soon opened in many other major cities.

Aqueduct

An aqueduct is a system for carrying water. Aqueducts can supply water to cities or to farms for irrigation. The water is carried from a lake, river, or reservoir through a conduit, or channel. The channel may be an underground

Roman Aqueduct

Modern Aqueduct

Early aqueducts had to rely on the force of gravity to move water over long distances. This meant that the water could only move from a high point to a lower point. Modern aqueducts use electric pumps to move the water along.

tunnel or pipe, a canal at ground level, or a bridge.

People built aqueducts in ancient Greece, Babylonia, Persia (now Iran), and India. Many of these aqueducts were tunnels dug into hillsides. Early aqueducts depended on gravity to create the flow of water. The water source had to be higher than the destination so the water could flow downhill all the way there. Variations in the height of the land, such as mountains and valleys, caused problems.

To move water across valleys people sometimes built aqueducts in the form of arched bridges with two or three layers of arches on top of each other. The water flowed through a channel in the top of the uppermost layer. The ancient Assyrians used 2 million stone blocks to build an aqueduct to carry water across a valley to their capital, Nineveh.

Ancient Rome had a complex system of 11 aqueducts built from 312 BC to AD 226. The system used both bridges and underground pipes. Some of the aqueducts are still used today. The Romans also built aqueducts in other parts of their empire.

Most engineers today use powerful pumps to force water upward when necessary. This allows modern engineers to design aqueducts in ways that ancient engineers could not. Instead of building a bridge over a valley, for example, modern engineers can simply run pipes down one side of the valley and up the other. Pumps powered by steam were

first used in the late 1700s. Later pumps were powered by electricity.

Arabian Peninsula

The Arabian Peninsula, or Arabia, is a piece of land in southwestern Asia. It is the original homeland of the Arab people. It is also the birthplace of the religion of Islam. The country of Saudi Arabia takes up about four fifths of the peninsula. The peninsula also includes Kuwait, Oman, Qatar, the United Arab Emirates, Yemen, Bahrain, and parts of Jordan and Iraq.

Geography

The Arabian Desert covers almost all of the peninsula. Some parts of the desert get enough rain for grass and shrubs to grow. In general, however, the climate is very dry and hot. At least one third of the desert is sandy. Other parts are cov-

Did You Know?

The Inca people of South America built a system of aqueducts to carry water down from the Andes Mountains. One Inca aqueduct was 360 miles (579 kilometers) long.

The Arabian Desert features large areas of mountains and raised flat areas called plateaus.

ered by bare rock. There are some hills and mountains.

The Arabian Peninsula has almost half of the world's supplies of petroleum (oil). Most of the oil is in or near the Persian Gulf, the body of water east of the peninsula. The countries of the region sell the oil to other countries.

People

Arabs make up most of the population of the peninsula. Nearly all Arabs speak the Arabic language. Most Arabs are Muslims, or followers of Islam. Muhammad, the founder of Islam, was born in what is now Saudi Arabia.

History

In ancient times the Sabaeans, the Minaeans, and the Himyarites built up powerful kingdoms in southwestern Arabia. These Arab peoples traded with Egypt, China, and India.

In the 600s Muhammad started Islam. Soon all of Arabia was united under the

religion. Then the Arabs spread Islam beyond the peninsula by conquering other lands. The Muslim leaders who followed Muhammad ruled a large Islamic empire. At first they ruled from Arabia. Later, however, they ruled from other parts of the empire.

In the 1500s the Ottoman Turks made Arabia part of their empire. However, they never gained firm control of the peninsula. The Arabs revolted repeatedly against the Ottomans. The Sa'ud family controlled the middle part of Arabia.

Meanwhile, the British took control of most of the southern and eastern coasts of Arabia. The local Arabian rulers united with the British against the Ottomans. They defeated the Ottomans in the early 1900s. Then the peninsula gradually became free from British rule. By 1971 the peninsula was made up entirely of independent countries. In 1990 the countries of North Yemen and South Yemen were united to form the Republic of Yemen.

Arab-Israeli Wars

Since the creation of Israel in 1948, the Jewish state has gone to war with its Arab neighbors on several occasions. The differences between the groups continued into the 21st century.

A map shows the territories that Israel and its neighbors fought over during the Arab-Israeli wars. At the end of the Yom Kippur War in 1974 Israel controlled the area marked in orange.

Background

The Middle Eastern region known as Palestine was the ancient home of the Jewish people. It became part of the Islamic world in the AD 600s. From 1923 to 1948 the British ruled the region. During this time, many Jewish immigrants from Europe settled there. Arabs also lived in Palestine, and both groups wanted to control the land.

When Britain gave up Palestine, the United Nations (UN) divided the land. Each group got the same amount, but the Arabs were unhappy because the Jews were given some land that was owned by Arab Palestinians.

The War of 1948–49

On May 14, 1948, as soon as Israel came into existence, Arab Palestinians and neighboring Arab countries declared war on Israel. Arab forces occupied parts of Palestine, but by the time the war ended Israel ended up with more land than it had before the war.

In 1949 Israel and the Arab states signed border agreements. There was no peace treaty, however. The many Palestinians who had left their homes ended up in refugee camps in Arab countries.

The Six-Day War

In the spring of 1967, fighting between Syria and Israel led to the Six-Day War. Israel saw that Egypt was preparing for war in order to aid Syria. On June 5 Israel struck quickly and wiped out nearly the whole Egyptian air force on the ground. In six days' time Israel seized the Old City of Jerusalem, the Sinai Peninsula, the Gaza Strip, the Jordanian territory west of the Jordan River (known as the West Bank), and the Golan Heights, on the Israeli-Syrian border.

The Yom Kippur War

On October 6, 1973, on the Jewish holy day of Yom Kippur, Egypt and Syria both attacked Israel. In the Yom Kippur

War, Israel pushed both armies back into their own territory but in turn suffered heavy losses. After fighting ceased early in 1974, the UN established neutral zones between those countries and Israel.

Ongoing Tensions

On March 26, 1979, Israel and Egypt signed a peace treaty. Tensions continued, however, between Israel and other Arab communities. The Palestine Liberation Organization (PLO) attacked Israel from camps in Lebanon in 1982. On June 5, 1982, Israel invaded the country. The PLO eventually left, but some Israeli troops remained in the country until 2000.

In the late 1970s Israelis began to build settlements on the land that it occupied on the Gaza Strip and West Bank. In 1987 the growth of these settlements caused Palestinians to protest. Demonstrations and riots—known as the intifada (uprising)—broke out and continued until the early 1990s. In 1993 Israel agreed to start turning over control of some of the occupied territories to the Palestinians. In 2000, however, a new intifada erupted. It stalled peace talks between Israel and the Palestinians.

Arabs

An Arab is someone whose native language is Arabic. The term was first used

Arabs shop at a street market in Cairo, Egypt.

to describe people who lived in a part of southwestern Asia called the Arabian Peninsula. Today the word Arab also refers to Arabic-speaking people who live in the Middle East, North Africa, and other places. In the early 21st century there were more than 100 million Arabs throughout the world.

Early Arabian society was made up of families that came together to form tribes. Tribes traced their heritage back many centuries. According to tradition, some Arabs are descended from a man named Qahtan, who lived in southern Arabia. Others are descended from a man named 'Adnan, of northern Arabia.

The religion of Islam brought Arabs together beginning in the early AD 600s. Because Islam's holy book (the Koran) is written in Arabic, that language soon was used by all who practiced the religion.

More than 90 percent of modern Arabs practice Islam. Religion is an important part of everyday life for many Arabs. It influences how people behave and dress. Arabs, especially women, tend to dress modestly. In many areas women are expected to wear dark robes and to cover their face with a veil in public.

Arabs who live in cities tend to have less traditional attitudes than those who live in small villages. Both men and women have more educational and employment opportunities in cities.

Arabian Peninsula • Islam

Aral Sea

The Aral Sea is a saltwater body in central Asia. The sea's name comes from the Kyrgyz word *Aral-denghiz*, meaning "Sea of Islands," because of the many islands in its waters.

Also called Lake Aral, the Aral Sea is situated more than 250 miles (400 kilo-

meters) east of the Caspian Sea. It is bordered by Kazakhstan on the north and Uzbekistan on the south. The Amu Darya and Syr Darya rivers are the sea's two main sources of inflowing water. The Aral Sea area has cold winters and hot summers. The area gets very little rainfall.

In 1960 the Aral Sea covered an area of 26,300 square miles (68,000 square kilometers). However, during the second half of the 1900s, most of the inflowing river water was used for irrigation before it reached the sea. The sea also loses water through evaporation. Because there is not much rainfall this water is not replaced fast enough to maintain the water level. The Aral has therefore shrunk drastically in its area and volume. By the end of the 1900s the Aral Sea had lost so much water that the exposed land divided the sea into three separate parts.

Scientists view the changes to the Aral Sea as a serious threat to the local environment and human health. As the water has evaporated, the salt and mineral content has risen dramatically. This has made the water unfit for drinking and killed the once-abundant supplies of freshwater fish. The fishing industry along the Aral Sea was virtually destroyed. Many groups tried to address these issues, but the problems continued into the 21st century.

Arapaho

An Arapaho man wears the traditional clothing of his people.

The Arapaho are Native Americans who originally lived in the Great Lakes region. They gradually moved westward and became great buffalo hunters and warriors of the western Great Plains.

The Arapaho traditionally were farmers, but as they moved west they began hunting instead. Bison (buffalo) meat became their main source of food. They used bison hides to make clothing and covers for their tepees.

The Arapaho were very religious people. They believed that sacred objects had supernatural power. Their most sacred object was the Flat Pipe, a tobacco pipe with a very long stem. They used this pipe only during special religious ceremonies.

By the mid-1800s the Arapaho had separated into two groups. The Southern Arapaho lived in what is now Colorado, and the Northern Arapaho lived in what is now Wyoming.

The Arapaho were pressured by the U.S. government to move to a reservation. In 1869 the Southern Arapaho moved to land in Indian Territory, which is now part of Oklahoma. In 1878 the Northern Arapaho moved to the Shoshone Reservation (now called the Wind River Reservation) in what is now Wyoming. Later in the 1800s both Arapaho groups lost much of their reservation lands to white settlers. At the end of the 20th century more than 6,000 Arapaho lived in the United States.

Arawak

The Arawak Indians once lived in South America and on islands in the Caribbean

The Arawak people were forced to leave the islands of the Lesser Antilles long ago. They left behind stone carvings and pottery.

Sea. The island Arawak, or Taino, were the Indians the explorer Christopher Columbus met on his first journey to the Americas.

The Arawak lived in large villages. They built their houses from logs, poles, and the leaves of palm trees. They got most of their food by farming. They also fished, caught shellfish, and hunted birds, lizards, and other small animals.

The Arawak first lived in northern South America. Then they spread to the Caribbean islands. Shortly before Europeans arrived, the warlike Carib people pushed the Arawak off the islands called the Lesser Antilles. Columbus met the Arawak in 1492. At that time the Arawak lived only on the Greater Antilles (Cuba, Jamaica, Hispaniola, and Puerto Rico).

Columbus' men and the Spaniards who followed them treated the Arawak harshly. They forced the Arawak to work in fields and in mines. Some Arawak died of starvation. Many others died of diseases brought by the Europeans.

By 1550 the island Arawak population had been reduced from 1 million or more to almost nothing. Their traditional way of life largely disappeared as well. Small groups of Arawak managed to survive. Their descendants now live in Cuba, Puerto Rico, and Florida.

Arbor Day

A day set aside for the planting of trees, Arbor Day began in Nebraska in 1872. Today people across the United States celebrate Arbor Day.

How Arbor Day Is Celebrated

Many states observe Arbor Day on the last Friday in April, though the date may vary depending on the climate. On Arbor Day people plant trees throughout their neighborhood. They plant trees as memorials to loved ones, to restore damaged landscapes, or just to add natural beauty to the surroundings.

History

J. Sterling Morton, a newspaper editor and politician, founded Arbor Day. In 1854 he moved from Michigan to Nebraska, which was then a territory. The Nebraska Territory was a land of rolling plains with few trees. Morton missed the trees he had known in the East.

After Nebraska became a state, Morton asked the state to create a holiday for

Girl Scouts plant a tree on Arbor Day.

Did You Know?

The largest Arawak villages had as many as 3,000 people living in them.

tree planting. Nebraskans celebrated the first Arbor Day in 1872. Arbor Day became a legal state holiday in 1885. The holiday later spread across the United States as well as to other countries.

Archaeology

Archaeology is the study of things that people made, used, and left behind. The goal of archaeology is to understand what people of the past were like and how they lived. Scientists who study archaeology are called archaeologists.

An archaeologist's work begins with finding a site to study. Some sites, such as ancient cities, are visible on the surface. Other sites are buried. Special devices can be used to sense structures that are underground or underwater.

After finding a site, an archaeologist digs slowly and carefully. This work is called excavation, or a "dig." Archaeologists use spoons, knives, picks, brushes, and other tools in their work. They try to uncover buildings, tools, weapons, art, and anything else that people made. These items are called artifacts.

Then archaeologists study the objects. They want to know when an artifact was made, what it was made from, and what it was used for. Archaeologists have several methods for figuring out an artifact's age. One method is called carbon-14 dating. Carbon-14 is a chemical found in all organisms, or living things. After an organism dies, the amount of carbon-14 decreases at a certain rate. An archaeologist measures this decrease to find out how long ago the organism died.

Archaeologists uncovered life-size figures of soldiers in an ancient tomb in China.

A team of archaeologists works on a "dig," or excavation, in Peru.

Archaeologists also try to understand the culture from which artifacts came. For example, tools such as arrow tips, knives, and grinding stones can tell an archaeologist how people got and prepared their food.

An archaeologist sometimes works with experts from other fields of study. Botanists, zoologists, and geologists can help to identify plants, animals, soils, and rocks found along with artifacts.

Archaeopteryx

A prehistoric bird, *Archaeopteryx* is best described as a feathered dinosaur with wings. *Archaeopteryx* is considered proof that birds developed from dinosaurs, because it had the traits of both.

When and Where *Archaeopteryx* Lived

Archaeopteryx lived about 159 to 144 million years ago. All known *Archaeopteryx* remains have been found in southern Germany.

Physical Features

Archaeopteryx reached 2 feet (60 centimeters) in length and had a wingspan of 2 feet (60 centimeters). It had wing feathers like those of modern pigeons. *Archaeopteryx* also shared several features with a group of small, meat-eating dinosaurs, however. It had well-developed teeth and a long, slender and flexible neck. It had long leg and foot bones, and it had claws on its hands.

Behavior

Some scientists believe that *Archaeopteryx* took off by running along the ground and leaping into the air, flapping its wings. However, other experts believe that *Archaeopteryx* most likely spent a lot of time perched in low-growing trees. The animal could simply launch itself from atop the branches and glide out on short flights. When it was not in the

Archaeopteryx

trees it is possible that *Archaeopteryx* swam and fished in the lagoons surrounding the islands on which it lived. *Archaeopteryx*, like both dinosaurs and modern birds, reproduced by laying eggs.

Archery

The sport of shooting arrows with a bow at a target is called archery. But archery is not just a sport. For thousands of years people used the skills of archery mostly for war and for hunting. Even today bow hunting is a popular activity.

Bows and Arrows

Bows allow people to shoot arrows farther and with greater force than is possible by simply throwing them. At its most basic, a bow is a long, thin piece of wood with a string stretched tightly from one end to the other. The string holds the wood in a curved position. People competing in archery contests today often use more complex bows made of wood, plastic, or fiberglass.

An arrow is a long, thin piece of wood, metal, or other material. It ends in a pointed tip. Near the other end of the arrow is a tail of feathers or plastic fins. The tail helps the arrow fly straight.

The tail end of the arrow fits onto the string of the bow. To shoot the arrow, an archer pulls the string back and lets it go. A lot of energy is stored up by the string being stretched. When the string

Modern archers shoot at targets up to 295 feet (90 meters) away.

is released, this energy is also released. This sends the arrow flying with great force.

Archery Competitions

There are many kinds of archery events. In most kinds the archers shoot arrows at round targets. Each target is marked with a circle surrounded by several rings. Archers earn a set number of points for hitting the various areas on the target with their arrows. They earn the most points for hitting the circle in the center and the least points for hitting the outer ring.

The most common types of archery used in contests are target archery and field archery. In target archery archers shoot a set number of arrows at targets at set distances. For example, an archer

may have to shoot 18 arrows at a target that is 230 feet (70 meters) away. In field archery the archer shoots arrows at several targets on a course set up to imitate hunting conditions.

World championships are held regularly in target, field, and other kinds of archery. The Summer Olympic Games feature target archery events for men and women, individually and in teams.

History

In prehistoric and ancient times many peoples in Europe, Asia, Africa, and the Americas made bows and arrows. The bow was one of the main weapons of war and hunting. The ancient Egyptians, Greeks, and Chinese also practiced archery as a sport.

The Huns, the Turks, the Mongols, and other groups used the bow and arrow for warfare while riding on horseback. Their

skills as archers helped them conquer large parts of Asia.

English soldiers began using a large bow called the longbow in the 1300s. It helped them win great military victories against France. The leading bow in other parts of Europe at the time was the crossbow. It was a small, powerful bow attached crosswise to a piece of wood. It had a groove to guide the arrow across the wood and a lever to pull and release the string.

In Europe guns replaced the bow and arrow as the major military weapon in the 1500s. Today soldiers in most parts of the world use firearms. However, many people still use a bow and arrow to hunt. Archery has also grown popular as a sport. In the 1900s archery became an Olympic event.

Architecture

The science and art of designing buildings is known as architecture. People who practice architecture are called architects. Architects express an artistic vision through the size, shape, color, materials, and style of a building's elements. But unlike painters or sculptors, who can create a work of art for its own sake, architects must design a building for a specific purpose. The architect can produce a work of art, but it must also be functional.

Elements of Design

The architect must consider how a structure will be used and by whom. An apartment building, a palace, a hospital, a museum, an airport, and a sports arena all have different building requirements. Another factor in the design is the ideas the structure should communicate. For example, some buildings are designed to impress people with a display of power

and wealth. Others are intended to make everyone feel welcome.

Other factors are the location and surrounding environment, including weather, and the cost of materials. And above all the architect must create a stable structure. Walls and roofs can buckle, crack, or collapse if they are not properly designed. Over the centuries, as people discovered building techniques that worked, those features became standard elements of design.

The arch was one of the first elements of this kind. It is a curved structure used to span an opening and support loads from above. It allowed builders to create larger doorways and other openings in walls. The vault is a continuous arrangement of arches, usually forming a ceiling or roof. Another common support element is the truss, or frame composed of triangular sections.

Arches

Vaults

Materials

Building materials are chosen based on many factors, including their appearance, strength, availability, and cost. Stone, brick, wood, and concrete have been used for thousands of years. Stone has often been used for large monuments because it lasts a long time and is easy to carve. But it is difficult to cut and transport, and it is too weak for certain support functions. Brick resists fire and is easy to produce, transport, and lay. Wood is very easy to acquire, transport, and work. But it burns easily, can develop mold, and may be eaten by termites. Concrete is made by mixing cement, water, and small pieces of sand and stones. It can be poured into molds to create various shapes, and it hardens into a solid, fire-resistant material.

A major advance came in the 1800s with the use of cast iron and then steel for support elements. These materials are fire-resistant, can be formed into many

shapes, and can produce very strong, tall structures. Builders also began embedding steel rods in concrete to make the concrete stronger.

History

The earliest buildings were simple structures made of materials that were easy to find. Eventually people began to live in large groups and form communities. As they did so their buildings became more elaborate. The Great Pyramids of the ancient Egyptians were enormous stone

A pyramid in Saqqarah, Egypt, was built for an ancient Egyptian king.

tombs for their leaders. In ancient times people in what is now Iraq built huge brick temple towers, called ziggurats, that were shaped like pyramids with several levels rising in steps.

The traditional architecture of China also developed in ancient times. It reflects a deep feeling for the harmony and order in nature. Traditional temples and houses are built chiefly of wood and decorated with tiles. The pagoda, a tower stretching toward heaven, developed from the stupa of ancient India. The stupa was a dome-shaped monument, usually built over the remains of a holy person.

Ancient Greece and Rome

The ancient Greeks and Romans established what became known as the classical style in Western architecture. The Greeks built simple structures of marble and stone. They developed three

styles—called Doric, Ionic, and Corinthian—identified by the type of columns they use as a basic unit. Each type of column had a special design, called a capital, at the top. These styles have been used in Western architecture ever since. A Greek temple was rectangular and had a porch, called a portico, at each end. Lines of columns supported the roof. An outstanding example is the Parthenon on the Acropolis in Athens.

The ancient Romans used round arches and other structural methods that allowed them to build enormous public buildings. An amphitheater was a large round or oval arena surrounded by several rings of seats at different levels. One of the most famous amphitheaters, the Colosseum, was built in Rome in about AD 70. A Roman basilica was a rectangular public building with a raised platform at one or both ends. The early Christians adopted the shape of the basilica for their churches.

Greek Capitals

Middle Ages

As Christianity spread throughout Europe during the Middle Ages (about AD 500 to 1500), many new churches were built. In the east, Eastern Orthodox Christianity was practiced in the Byzantine Empire. A typical Byzantine-style church had a large dome on top of a square building. Inside were marble pillars and much decoration. The most famous building in this style is the Hagia Sophia in Istanbul, Turkey, completed in 537. As the Eastern Orthodox church spread to Greece, eastern Europe, and Russia, domed churches were built there too.

Did You Know?

U.S. architects copied ancient Roman styles in their designs for the U.S. Capitol and many other government buildings.

Domes

Roman Catholicism became powerful in western Europe. In the 900s and 1000s some of the new Catholic churches used ancient Roman architectural elements, such as the round arch. Their style is therefore known as Romanesque.

From the mid-1100s to the 1500s, a new style of architecture, known as Gothic, was used in western Europe. Advances in construction methods enabled building interiors to be made much taller and broader. Pointed arches were used instead of round ones, and vaults made of a series of arched stone ribs supported the ceiling. New techniques also allowed for thinner walls with large windows filled with stained, or colored, glass.

Rise of Islam

Islam developed in the Middle East in the 600s and spread to northern Africa, southern Asia, and parts of Europe. Architecture became the most

important expression of Islamic art, especially in mosques. Mosques usually have a large open space for prayer and an attached tower called a minaret. Sacred writing may provide decoration, but no paintings or statues are used. Early Islamic monuments include the Dome of the Rock (finished in 691) and Al-Aqsa mosque (700s), both in Jerusalem, and the Great Mosque of

A tomb in Agra, India, is made of white marble. It was built during the reign of the Muslim rulers known as the Mughals, in the 1600s.

Córdoba, Spain (700s–900s). In southern Asia, Islamic architecture came to include Hindu and Persian elements too. White marble and red sandstone were often used. A famous example of this style is the Taj Mahal, a tomb built in Agra, India, in the 1600s.

Renaissance, Baroque, and Later Styles

A period called the Renaissance began in Italy in the 1300s. Renaissance architects revived classical Greek and Roman styles, using columns, round arches, and domes. Among the famous Italian Renaissance architects were Filippo Brunelleschi, Bramante, Leon Battista Alberti, and Andrea Palladio. The Renaissance style spread from Italy to the rest of Europe.

Baroque architecture became popular in southern Europe in the 1600s. It emphasized dramatic and elaborate decorations, vivid colors, and luxurious materials. In France and England the baroque was more subdued and was often mixed with the classical style.

In the 1700s some European architects returned to a simpler style called neoclassicism (or new classicism). In England the ancient form of the Roman villa was adapted to suburban and country houses. In the 1800s Gothic styles became popular again in England and the United States. Renaissance and baroque styles were also used in the United States for houses and public buildings.

Modern Developments

The growing population and rising cost of land in cities in the late 1800s made it necessary to put tall buildings on small lots. As buildings got taller the walls had to become stronger. In 1885 William Le Baron Jenney designed the Home Insurance Company Building in Chicago, Illinois. It was the first building in which the exterior walls were entirely supported on an internal steel frame. The steel frame led to the skyscraper age.

One of the most influential architects of the skyscraper was Chicago's Louis Sullivan. He believed that a building's design should reflect its function, and he often used decoration based on natural forms. His student Frank Lloyd Wright became one of the most influential architects of the 1900s. He thought buildings should be in harmony with their natural surroundings and the people who use them.

The clean, simple lines of modernist architecture are shown in buildings designed by Mies van der Rohe.

The MARTa museum in Germany was designed by Frank Gehry.

His Prairie style emphasized horizontal lines in houses with low, gently sloping roofs.

Modernist buildings of the mid-1900s typically had plain, rectangular forms with no extra decoration. The architect known as Le Corbusier designed buildings in France with flowing interior spaces, flat roofs, and large windows in plain white walls. German architect Ludwig Mies van der Rohe designed steel and glass structures in simple geometric forms with clean lines.

Beginning in the 1960s some architects reacted against what they saw as the cold, bare forms of modernism. These architects were called postmodern. They included Philip Johnson, Robert Venturi, and Michael Graves. Some of them playfully used classical features such as arches and columns in new ways. Starting in the late 20th century architects such as Frank Gehry moved away from traditional right angles. They featured free-form curves in many of their designs.

Arctic Ocean

The Arctic is the smallest of the world's oceans. It occupies the most northern region of Earth. The North Pole is near the center of the Arctic Ocean.

Physical Features

The Arctic Ocean covers an area of 5,440,000 square miles (14,090,000 square kilometers). The landmasses of Eurasia (Europe and Asia), North America, and Greenland surround the ocean. The Arctic has several islands on its edges but none in the center, where there is a permanent cover of ice. A narrow passage called the Bering Strait connects the Arctic Ocean with the Pacific Ocean. The Greenland Sea connects the Arctic with the Atlantic

Ocean. The deepest point in Arctic waters is 18,050 feet (5,502 meters), but the average depth is 3,240 feet (988 meters).

Two forms of ice are found in the Arctic Ocean: sea ice and pack ice. Sea ice is frozen seawater that forms and melts depending on the season. The mass of sea ice that remains frozen year after year is called pack ice. Pack ice is generally smoother and less salty than other sea ice.

The pack ice in the Arctic is hundreds of miles across. It drifts around the ocean in a clockwise direction. It completes one revolution around the North Pole every 10 years.

Climate

All Arctic waters are cold, and the climate in the Arctic regions is among the harshest in the world. The coldest temperatures can drop to -85°F (-65°C), especially at the end of the long Arctic winter.

A walrus sits on top of an iceberg in the Arctic Ocean.

Economy

Because of the ice in the Arctic, there are very few fish in the main body of the ocean. However, some of its surrounding seas—the Barents, Greenland, and Bering seas—are rich fishing grounds. Whale hunting, or whaling, was once a major Arctic industry, but governments now limit it to protect the whales. People still hunt seals in some areas.

Exploration

The Dutch and the English became the leaders in Arctic exploration in the early 1500s. They were seeking a route, called the Northeast Passage, across the Arctic to the Far East. A Swedish explorer finally made the trip in 1878–79. He sailed from Norway, through the Russian side of the Arctic Ocean, and out into the Pacific. In the 1880s and 1890s Fridtjof Nansen, a Norwegian explorer, made more important explorations of the Arctic Ocean.

Later explorers used dog sleds to try to get across the ice to the North Pole. The U.S. explorers Robert E. Peary and Matthew Henson claimed to be the first to reach the North Pole, in 1909.

Environmental Issues

Hunting in the Arctic has endangered several types of animals, including whales and walrus. Other economic activities are also cause for concern. Oil tankers that sail through the Arctic waters are threatened by ice. If damaged, they can release tons of oil into the ocean waters.

Did You Know?

At the North Pole the sun does not rise above the horizon for six months of the year. For the rest of the year the sun never sets.

Global warming may be the most serious environmental problem for the Arctic Ocean. Global warming is a slow rise in Earth's temperature that may be caused by pollution. Some scientists warn that this warming could cause the Arctic pack ice to melt. The levels of oceans around the world would then rise, and many coastlines would disappear.

Ares

In ancient Greek mythology Ares was the god of war. He was one of the 12 major gods believed to live on Mount Olympus. His bird was the vulture, and his animal was the dog. Ares is associated with Mars, the god of war in ancient Roman mythology.

Ares was the son of Zeus, the chief god, and his wife, Hera. Ares was said to have loved Aphrodite, the goddess of love. Ares and Aphrodite had several children.

Even though Ares was one of the main Greek gods, people did not worship him much. The ancient Greeks thought Ares was cruel. They believed that he enjoyed sending war and disease to humans.

Unlike Ares, Mars was a popular and important god. The Romans thought of Mars as a powerful nature god, as well as the god of war. They prayed to him to protect their crops and farm animals. The month of March was named after Mars because it was the time when

farmers began to plant their crops. Mars, the fourth planet from the sun, was also named after him.

Aphrodite • Mythology

Argentina

Parts of Patagonia are cold enough to be covered by glaciers. Glaciers are masses of moving ice.

The country of Argentina takes up most of the southern part of South America. Its name is a Spanish word meaning “Land of Silver,” after the silver found there by Spanish explorers. The capital is Buenos Aires.

Geography

Argentina is bordered by Chile, Bolivia, Paraguay, Brazil, and Uruguay. The Atlantic Ocean lies to the east.

Argentina has four major regions: the Andes, the North, the Pampas, and Patagonia. The Andes Mountains run along the western edge of the country. Their highest peak is Mount Aconcagua, at 22,831 feet (6,959 meters). The North includes the Gran Chaco, an area of dry lowlands, and Mesopotamia, an area

between the Paraná and Uruguay rivers. The central Pampas are grasslands. Patagonia is a cold, dry, windy region in the south.

Tierra del Fuego is a group of islands off the southern tip of the continent. Argentina shares the islands with Chile.

Most of Argentina has a mild climate with cool, damp winters. The northeastern areas get the most rain.

Plants and Animals

Argentina’s plants vary widely from region to region. There are forests in the Andes, thorny trees and cactuses in the

Gran Chaco, and rain forests in Mesopotamia. In the Pampas there are grasses in the humid section and scrub forests in the dry section. Patagonia has zones of broadleaf forests, steppe, and desert.

Argentina also has a wide variety of wildlife. In the northwest live guanacos, llamas, and alpacas. Deer, monkeys, jaguars, and tapirs live in Gran Chaco and Mesopotamia. Herds of cattle and horses roam the Pampas. Parrots and canaries live in the southern tip of the country.

People

Most Argentines live in cities, especially Buenos Aires. Most of the population has European roots. About 10 percent of Argentines are American Indian or mestizo (a mixture of European and Indian). Spanish is the national language. Roman Catholicism is the main religion.

Economy

Banking and other services, manufacturing, and trade are the most important parts of the economy. Argentina's natural resources of petroleum (oil) and natural gas help its industries. Farmers produce soybeans, sugarcane, grains, beef, wool, and wine. Exported goods include food, petroleum, and metal products. Tourists also bring billions of dollars to Argentina each year.

History

Native peoples of what is now Argentina included the Tehuelche, the Querandí, the Puelche, the Diaguitas, and the Inca. Spaniards arrived in the early 1500s.

They founded the colony of Buenos Aires in 1536. The Europeans forced the native people to work for them.

Argentina was first part of Spanish Peru and then part of a province called Río de la Plata. Río de la Plata declared its independence in 1816 but soon broke up in a civil war. After the war, a series of dictators, presidents, and military leaders ruled Argentina.

In the 1900s Argentina suffered many economic and political problems. President Juan Perón, elected in 1946, and his wife Eva (Evita) were popular among workers for a time. However, the military overthrew Perón in 1955 and his third wife, President Isabel Perón, in 1976. The military government then imprisoned and killed thousands of citizens in what became known as the Dirty War.

In 1982 Argentina went to war with the United Kingdom over the Falkland Islands. The United Kingdom gained control of the islands. The defeat caused Argentina's military leader to step down. In 1983 the country held an election, which ended military rule. Leaders then worked to improve human rights and the economy. In the late 20th and early 21st centuries, however, rising poverty and unemployment led to protests throughout Argentina.

Arikara

The Arikara tribe of Native Americans traditionally lived along the Missouri River in what is now in North Dakota. Originally their culture was related to that of the Pawnee tribe of present-day Nebraska. They are now associated with the Hidatsa and the Mandan peoples.

The early Arikara lived in villages situated along riverbanks. There they built dome-shaped houses made of mud packed around a wooden frame. They also constructed larger lodges, which they used for religious ceremonies.

Near their villages, Arikara women tended fields. They grew corn, beans, squash, sunflowers, and tobacco. Arikara men fished and hunted deer, elk, and bison (buffalo).

French and English traders regularly visited the Arikara to trade guns and other European goods for animal furs. In 1823 the Arikara killed 13 members of a white trading party, and soon after-

ward they became the first plains tribe to battle the U.S. Army.

During the 1800s, the Arikara population declined due to warfare and exposure to European diseases, such as smallpox. In order to protect themselves from their enemies, the survivors of the Arikara, Mandan, and Hidatsa tribes moved to a single village. The three tribes became officially known as the Three Affiliated Tribes in 1934. Today members of this group live on the Fort Berthold Reservation in North Dakota. At the end of the 20th century, there were about 900 Arikara living in the United States.

Arithmetic

Arithmetic is the most elementary branch of mathematics. It is the part of mathematics that deals with counting as well as addition, subtraction, multiplication, and division. All of the other branches of mathematics use the principles and rules of arithmetic. Everyone uses arithmetic every day. It is used when buying something at a store, measuring distances, or simply counting to 10. The word arithmetic comes from the Greek word *arithmos*, which means “number.”

Did You Know?

The abacus is a tool for doing arithmetic. It was invented hundreds of years before the calculating machine.

Arizona

Arizona is known as the Grand Canyon State because of the amazing landform found in the northern part of the state. The awesome size and beauty of the Grand Canyon make it one of the most famous natural wonders in the world. Phoenix is Arizona's capital and largest city.

Geography

Arizona is located in the southwestern United States. The Colorado River separates Arizona from Nevada and California to the west. Arizona also borders Utah on the north, New Mexico on the east, and the country of Mexico on the south.

Mountains run across the state from northwest to southeast. To the south of

the mountains is a large area of desert plains, valleys, and smaller mountain ranges. Most of Arizona is very hot and dry during the summer and pleasant during the winter.

People

Though the majority of Arizonans are of European origin, the state is notable for its large Hispanic and Native American minorities. About one quarter of the people are Hispanic, mainly of Mexican heritage. The Native American population is larger than those of all states except Oklahoma and California. The Navajo are Arizona's largest native group. Many of them live on a huge reservation that covers parts of Arizona, Utah, and New Mexico. The state also has small African American and Asian minorities.

Most of Arizona's people live in the southern half of the state. Located in south-central Arizona, Phoenix is the state's major city. Other cities include Tucson, Mesa, Glendale, and Scottsdale. The University of Arizona is located in Tucson. Arizona State University's main campus is in Tempe, which is near Phoenix. In the north are Prescott and Flagstaff, the home of Northern Arizona University.

Economy

Businesses dealing in real estate and tourism are important parts of Arizona's economy. The state's main manufactured goods include computers and

The Hohokam people carved many designs into rocks hundreds of years ago. Today these carvings can be seen at Saguaro National Park in Arizona.

other electronic equipment, transportation equipment, and metal goods. Cotton and citrus fruit are major farm products. Other crops include vegetables and a variety of grains. Cattle are raised on large ranches. Arizona is also a major producer of copper.

History

Arizona has been home to Native Americans for thousands of years. Pre-historic peoples such as the Hohokam, the Anasazi, and the Mogollon developed advanced cultures in the region. When Spanish explorers arrived in the 1500s they found Hopi, Papago, and

Pima Indians. Later the Apache, the Navajo, and other tribes moved into the area.

In 1539 a Roman Catholic priest named Marcos de Niza claimed the land for Spain. For nearly 300 years the Spanish continued to explore and settle in the Arizona area. After gaining independence from Spain in 1821, Mexico ruled the area. The United States took control of the land in 1848, following its victory over Mexico in the Mexican War.

The discovery of gold, silver, and copper in the 1850s brought many miners to the area. The opening of railroads in the 1880s also brought settlers from the eastern United States into the area. Arizona became a territory of the United States in 1863 and a state in 1912. Copper mining remained the state's most important industry until the 1950s.

Arizona's population grew quickly after World War II. Many of the soldiers that had trained at military bases in Arizona returned with their families after the war ended.

Since the late 20th century Arizona has been one of the country's fastest-growing states. In 2000 it was the 20th state in population. By the end of the decade it had moved up to 14th.

Arkansas

The U.S. state of Arkansas got its name from a word that early

French explorers used for the local Quapaw Indians and the river along which they settled. Arkansas's official nickname is the Natural State, which refers to the state's beautiful countryside of mountains, lakes, and streams. The capital is Little Rock.

Geography

Arkansas is located in the south-central United States. It borders Missouri on the north, Oklahoma and Texas on the west, and Louisiana on the south. On the east the Mississippi River separates Arkansas from Tennessee and Mississippi.

Highlands cover northern and western Arkansas, and lowlands cover the south and east. The Arkansas River divides the highlands into the Ouachita Mountains on the south and the Ozark Mountains (or Ozark Plateau) on the north. The highlands are densely forested. The lowlands are plains with good farmland and

A waterfall tumbles over a rock ledge in the Ozark Mountains in Arkansas.

some hills. Arkansas generally has mild winters and hot, humid summers.

People

About four fifths of Arkansans are of European heritage. African Americans are the largest minority, making up more than 15 percent of the state's population. Almost half of the people live in rural settings. Little Rock is the largest city. It is located in the middle of the state on the south bank of the Arkansas River. The main campus of the University of Arkansas is in the northern city of Fayetteville.

Economy

Leading farm products in Arkansas are poultry (especially broiler chickens), cattle, soybeans, and rice. The processing of farm products is the state's leading manufacturing industry. Many Arkansans are employed as service pro-

viders in such areas as government, retail trade, and health care. Wal-Mart, the largest chain of retail stores in the world, began in Arkansas.

History

What is now Arkansas was originally home to several Native American groups, including the Caddo, the Osage, and the Quapaw. The first Europeans to visit the area were Spaniards. Hernando de Soto arrived in the early 1540s in search of gold. But the French built the first permanent settlement, in 1686.

In 1803 the United States acquired the region from France as part of the Louisiana Purchase. Arkansas became a U.S. territory in 1819 and a state in 1836. In 1861, however, it withdrew from the Union during the American Civil War and joined the Confederacy. It was readmitted to the Union in 1868.

Arkansas remained largely undeveloped and poor for the first half of the 1900s.

During the civil rights movement the state was a focus of national attention. In 1957 Governor Orval Faubus tried to prevent African American students from entering Little Rock's all-white schools. The federal government stepped in and forced the schools to allow racial integration.

The economy of Arkansas began to improve in the late 1950s. The state worked to bring in manufacturing plants, which created new jobs.

One of the most notable people in Arkansas politics was Bill Clinton. After five terms as the state governor, he served as president of the United States from 1993 to 2001.

Arm

Humans, apes, and monkeys have two upper limbs called arms. Each arm hangs from a shoulder and contains bones, joints, and muscles. These parts work together to give the arm a wide range of movement. The arm can bend, rotate, swing back and forth, and move from side to side.

The human arm is similar to the front limbs of other animals.

Structure

There are three bones in the arm. The upper bone is called the humerus. The top of the humerus fits into a cuplike socket in the shoulder. Together they make a joint that is held together by tough strands called ligaments. This joint allows the upper arm to swing and rotate. A pair of muscles is attached to the humerus. One muscle bends the arm. The other muscle straightens it.

The lower end of the humerus connects to a bone called the ulna at a joint in the elbow. The ulna and another bone, the radius, go from the elbow to the wrist. This part of the arm is called the forearm. A pair of muscles in the forearm makes it twist from side to side. The forearm ends in the hand.

Function

Humans, apes, and monkeys use their arms and hands to push and pull objects, to fight and defend themselves, and to carry their young. Apes and monkeys also use their arms to swing on branches and to move around on the ground.

Arms in Other Animals

Many other animals have two front limbs, but only primates have true arms. The two front limbs of other animals are known as legs, flippers, or wings. Both starfishes and octopuses have limbs that people sometimes call arms. But these arms have no bones or joints. Starfish arms are also called rays, and octopus arms are also called tentacles.

Armada, Spanish

The Spanish Armada was a fleet of ships that Spain sent to attack England in 1588. The English defeated the Spanish, which made Spain less powerful in Europe.

The Armada sailed in May 1588 with 130 ships and 27,000 men. They reached the English Channel in late July and fought a few battles. On August 8 the English won a decisive victory. They had fewer ships, but they had big guns and could fire at long range. This was unusual because at the time, sea battles were fought at close range so that soldiers could climb aboard enemy ships.

The defeat of the Spanish Armada saved England from invasion. It also was the first major gun battle at sea. For hundreds of years afterward, gun-armed warships ruled the seas.

Armadillo

Armadillos are small mammals related to sloths and anteaters. They have a tough armor that protects them from enemies and other dangers. The word armadillo is Spanish for “little armored one.”

There are 20 species, or types, of armadillo. They live mainly in or near the tropical (hot) regions of Central and South America. One species lives in the southern United States. Most species live in open areas, but some live in forests.

The nine-banded armadillo is the only kind of armadillo that lives in the United States.

Armadillos are stout with short legs and strong, curved claws. They range in length from about 6 inches (15 centimeters) to 5 feet (1.5 meters). Armadillos are usually brownish black with some yellow markings. Their armor is a type of hardened skin. It is made up of solid plates and flexible bands. It covers most of the body, including the head and usually the tail.

Most armadillos have very little hair. The pink fairy armadillo, however, has a coat of soft, white hair on its underparts and sides.

Armadillos are usually active at night. They live in burrows, or holes that they dig in the ground. Armadillos also dig to find food. They eat mainly termites and other insects, worms, roots, and small animals.

Female armadillos usually bear one to 12 identical young. All develop from a single egg inside the mother.

Did You Know?

Some types of armadillo are able to roll themselves into a ball to protect their underparts from enemies.

Armenia

The Republic of Armenia is one of the world's oldest centers of civilization. Yerevan, the capital, is also one of the world's oldest cities.

Geography

Armenia is located in western Asia, between the Black Sea and the Caspian Sea. It is bordered by Georgia, Azerbaijan, Iran, and Turkey. Armenia is a mountainous country. The Lesser Caucasus Mountains stretch across the north. Armenia's highest peak, Mount Aragats, is 13,418 feet (4,090 meters) high. The area has experienced many earthquakes, including one in 1988 that killed some 25,000 people.

Armenia has a dry climate. Summers are generally hot. Winters are generally not very cold, except in the mountains and on the windy plateaus.

The Khor Virap monastery is an important religious site for Armenians. It is associated with Gregory the Illuminator. He introduced Christianity to the Armenians more than 1,700 years ago. Behind the monastery rises Mount Ararat, in Turkey.

Plants and Animals

Junipers, dog roses, and honeysuckles grow in the lower areas of Armenia. Thorny bushes cover the mountain slopes. There are beech forests in the northeast and oak forests in the south-east.

Among the animals found in Armenia are wild boars, wildcats, jackals, Syrian bears, lynx, ibex (a kind of wild goat), and mountain sheep.

People

About 98 percent of the people are ethnic Armenians. There are small numbers of Kurds and other groups. Armenian is the official language. Most people are

Christians of the Armenian Apostolic church. Historically, the Armenian church has been independent of both the Roman Catholic and the Eastern Orthodox churches.

Economy

Despite the growth of cities and industries, agriculture is very important to Armenia's economy. Farmers raise potatoes, wheat, tomatoes, barley, grapes, watermelons, sheep, and cattle. Factories make food products, metal products, jewelry, machinery, chemicals, tobacco, and textiles. Mines provide copper. Transportation can be difficult because of the mountains, but Armenia has a network of roads and railways and an airport.

History

Armenian civilization began as early as the 500s BC. It reached its greatest size and influence in the 1st century BC. The Roman Empire conquered Armenia in 30 BC. From the 300s to the 1800s Persians, Byzantines, Arabs, Mongols, Turks, Russians, and others conquered and ruled Armenia at different periods.

During 1895–96 Ottoman Turks killed thousands of Armenians, who wanted independence from the Ottoman Empire. In 1915, at the beginning of World War I, another 600,000 Armenians died of starvation or were killed by Turks. After the war Armenia enjoyed a brief period of independence.

In 1920 the Soviet Union invaded Armenia and forced it to accept a Com-

Schoolchildren walk toward a monument in Yerevan. The monument honors thousands of Armenians who were killed in 1915.

unist government. Two years later the Soviets formed the Transcaucasian Soviet Federated Socialist Republic, which included Armenia, Azerbaijan, and Georgia. The three countries became separate republics within the Soviet Union in 1936.

On September 23, 1991, Armenia declared its independence from the Soviet Union. However, Armenia still relied on economic and military help from Russia.

In the 1990s Armenia fought with neighboring Azerbaijan over control of Nagorno-Karabakh, an area of Azerbaijan with a largely Armenian population. Armenia took control of the region and other Azerbaijani territory in 1993. The continuing conflict hurt Armenia's economy. Many Armenians left the country.

Armor

When people think of armor, images of a knight covered in clanking metal often come to mind. However, the word armor is used for any kind of clothing that is intended to protect the wearer in combat. As weapons have changed, armor has changed also. An outfit that stops an arrow might not work against a bullet.

Like early clothing, early armor came from animals. Thousands of years ago

warriors cushioned their bodies against the blows of clubs with layers of furry hides. Chinese warriors in the 1000s BC wore armor made of layers of rhinoceros hide.

Later, people learned to use plates made of tough material such as metal, horn, wood, or plastic. Plate armor provided great protection to the body. The ancient Greeks used bronze plates made to fit the body and limbs. The ancient Romans favored plate armor made of iron.

Today

Since ancient times warriors have worn armor to protect themselves during battle. Armor has taken many different forms over the centuries.

Plate armor was not very flexible, however, and in the early Middle Ages mail, or chain mail, became the main form of armor. Mail was made of interlinked rings of iron or steel. Mail was flexible and could be worn as a shirt, as leggings, or as a hood.

By the 1300s, plate armor was being made in such a way that the person wearing it could move freely. The armor that protected the knights of Europe during the late Middle Ages was made of large steel or iron plates. This kind of armor replaced mail.

As firearms became more powerful, armor had to get heavier. Eventually armor became too heavy and bulky to be practical. Plate armor disappeared completely in the 1700s.

Some forms of armor continue to be important in modern times. Soldiers wear helmets and other protective clothing. A common form of modern body armor used today is the bulletproof vest. Worn especially by police officers, it often has a lining of overlapping steel disks. Fiberglass and other light artificial materials are sometimes used as well.

Lance Armstrong (in yellow) nears the end of the Tour de France bicycle race in 2005.

France—the world's most difficult bicycle race—seven times.

Lance Armstrong was born on September 18, 1971, in Plano, Texas. He was good at sports at an early age. After finishing high school, he devoted himself to cycling. In 1990 he won that sport's U.S. Amateur Championship.

Armstrong began to earn money as a professional cyclist in 1992. The next year he won the world championships in men's road racing and many other competitions.

In 1996 Armstrong was ranked the top male cyclist in the world. But later that year he fell seriously ill with cancer. Surgery and chemical treatments called chemotherapy eventually saved his life.

Doctors doubted that Armstrong could return to a sport as physically demanding as cycling. However, Armstrong won the Tour de France in 1999. He went on to win every Tour de France for the next six years. After his victory in 2005, Arm-

Armstrong, Louis

U.S. trumpet player and singer Louis Armstrong was one of the world's greatest jazz musicians. He influenced nearly all jazz horn players who came after him.

Louis Daniel Armstrong was born on August 4, 1901, in New Orleans, Louisiana. As a boy he earned some money by singing in the streets. After he fired a pistol one New Year's Eve, he was sent to a home for troubled kids in 1913. There he learned to play cornet.

In 1922 cornetist King Oliver invited Armstrong to Chicago to join his band. Armstrong later joined Fletcher

Henderson's big band in New York City for a year.

Armstrong returned to Chicago and began playing the trumpet. By 1929 he was famous, and he toured the United States and Europe as a trumpet soloist accompanied by big bands. He started performing popular songs in addition to jazz. He also began to sing lyrics in a low, rough voice that was very distinctive.

After 1935 Armstrong appeared in movies and on radio and television. In 1940 he formed Louis Armstrong's All-Stars, a Dixieland band with six musicians. For most of the rest of his life, he toured with this group. He died on July 6, 1971, in New York City.

Armstrong, Neil

In 1969 U.S. astronaut Neil Armstrong became the first person to walk on the Moon. Millions of people watched on television as Armstrong stepped out of his spacecraft and said, "That's one small step for [a] man, one giant leap for mankind."

Neil Alden Armstrong was born on August 5, 1930, in Wapakoneta, Ohio. He became interested in airplanes at a young age. He received his pilot's license on his 16th birthday. After high school Armstrong became an air cadet in the U.S. Navy. In the 1950s he was a pilot in the Korean War.

Did You Know?

Louis Armstrong's nickname was "Satchmo."

Louis Armstrong

Neil Armstrong

In 1955 Armstrong joined the National Aeronautics and Space Administration (NASA) as a test pilot. Seven years later Armstrong became an astronaut.

On July 16, 1969, Armstrong, Edwin E. (Buzz) Aldrin, Jr., and Michael Collins left for the Moon in the Apollo 11 spacecraft. Four days later, Aldrin and Armstrong landed on the Moon in the Eagle, a landing vehicle that separated from the Apollo spacecraft. Armstrong was the first to step out onto the Moon's surface. For more than two hours he and Aldrin collected samples of Moon soil, made measurements, and took photographs before they began their return trip to Earth.

Armstrong retired from NASA in 1971. He continued to teach and to work on committees about the space program.

Army

An army is a large, organized group of soldiers trained to fight other armies or groups. An army's main job is usually to defend its country in times of war. An army protects the country against attacks or invasion by enemies. It may also fight in other parts of the world.

An army is usually one of several major branches of a country's armed forces. In the United States the other major branches are the Air Force and the Navy (which includes the Marine Corps).

Armies Today

Modern armies have ranks, or levels of power. The soldiers who command soldiers in lower ranks are called officers. The officers in the highest ranks are the generals. The generals are in charge of the army as a whole. Beneath the generals are the commissioned officers. They are graduates of special military training schools. Beneath them are the noncommissioned officers. These are men and women who started out as ordinary soldiers and moved up through the ranks. The ordinary soldiers, or privates, make up the lowest ranks of an army.

Soldiers stand in formation at a U.S. Army post in Hawaii.

Sometimes people are drafted, or ordered by their government to join the army. Drafts are common in times of war when too few people volunteer. For example, the United States, Canada, and the United Kingdom had drafts during World War II. Today, however, volunteers make up these countries' armies. Some countries, such as China and Israel, still require most of their citizens to serve time in the army.

History

The first army was probably organized in Sumer, a civilization that began more than 6,000 years ago in the Middle East. The earliest soldiers fought with swords, shields, and bows and arrows. They protected themselves with armor.

Over the centuries, new developments in warfare changed the way armies fought. Arabs and Europeans invented weapons that used gunpowder in the 1300s. Armies began using machine guns in the 1800s and bombs in the 1900s. Armies continue to develop new weapons. New technology also has helped improve communications and protect soldiers on the battlefield.

Titan, or one of the giants who once ruled the world. Artemis was the twin sister of Apollo, the god of music and light. Apollo was associated with the sun, while Artemis was associated with the moon. Some people believed that Artemis helped women during childbirth. Artemis was a protector of animals, but she also hunted them. Artists showed Artemis with a deer or with her hunting dog and silver bow, a weapon used to shoot arrows.

According to one story, Artemis loved the giant huntsman Orion and lived with him in the forest. Eventually, Artemis became jealous. She thought that Orion loved another woman. In revenge, Artemis shot Orion with an arrow. Orion was placed in the sky after his death. There he became a constellation (a group of stars).

Arthritis

Arthritis is a common medical problem for older people. Sufferers of arthritis experience swelling, pain, and redness in the joints—the places where the bones meet. Arthritis commonly affects the spine, hips, knees, and hands. It may also attack many other parts of the body. In severe cases, people may find it difficult or even impossible to move the joints at all.

Arthritis seems to run in families. People whose parents or grandparents had

Arthritis can bend fingers out of shape.

arthritis often get it themselves. Infections and injuries can cause rarer types of arthritis.

In most cases, arthritis is a lifelong condition without a cure. However, aspirin, ibuprofen, or other drugs may help to relieve the pain and swelling. Exercise may help to increase movement. In some cases doctors may perform surgery. They can remove unhealthy tissue or replace severely damaged joints with ones made of plastic or metal.

Arthur, Chester

When President James A. Garfield was assassinated in 1881, Chester A. Arthur, the vice president, rose to the highest office of the United States. Because many people did not believe that Arthur would make a good president, he worked hard to gain the public's respect.

Chester A. Arthur

Early Life and Career

Chester Alan Arthur was born on October 5, 1829, in the village of Fairfield, Vermont. He was the son of William Arthur, a Baptist minister, and Malvina Stone. Chester entered Union College in Schenectady, New York, when he was only 15. After graduating at age 18, he

studied law while teaching. In 1859 Arthur married Ellen Lewis Herndon. The couple had three children.

Beginning in 1854, Arthur worked as a lawyer in New York City. He became known for his antislavery principles. Arthur won the case of slaves who demanded their freedom after coming to the free state of New York. Arthur also represented an African American woman who had been forced off a streetcar reserved for whites. His success led to a New York law against discrimination in public transportation.

Political Career

In the 1850s Arthur helped to organize the new Republican Party in New York State. In 1868 he worked on Ulysses S. Grant's successful presidential campaign. In 1871 President Grant appointed Arthur customs collector for the port of New York City. In 1880 the Republicans nominated Garfield for president and Arthur for vice president. The Republi-

Arthur becomes president after President Garfield dies.

1881

Arthur retires and Grover Cleveland becomes president.

1885

cans won the election, and Arthur took the country's second highest office.

Presidency

On July 2, 1881, a man with a history of mental illness shot President Garfield. Upon Garfield's death in September, Arthur became the country's 21st president. The public considered him unqualified for the post.

However, Arthur surprised everyone by reforming the civil service, the system of government employees. Until that time many politicians gave jobs in the government to friends, party members, and people who paid them money or gave them gifts. In 1883 Arthur signed the first civil-service law, the Pendleton Act, which required that government employees be hired for their skills.

Arthur vetoed, or rejected, a law that would have banned the immigration of Chinese people for 20 years. However, he signed the Chinese Exclusion Act of 1882, which stopped Chinese immigration for 10 years. Arthur also helped to modernize and expand the U.S. Navy.

Arthur's popularity grew with each year of his presidency. In 1884, however, the Republicans nominated James G. Blaine for president. (Blaine lost the election to Grover Cleveland.) Arthur finished his term as president and then returned to New York City. He died at his home on November 18, 1886.

Arthur, King

Arthur was a legendary king of ancient Britain. He appears in a group of stories that are together known as the Arthurian legend. The stories are a combination of history, myth, romance, fairy tale, and religion. They have captured peoples' imagination for many hundreds of years.

Some scholars believe that Arthur was a real person who lived in Britain in the AD 400s or 500s. According to these scholars he led the Christian Celts in wars against Saxon invaders. After Arthur was killed in battle, his people fled to Wales and to Brittany in France. There they told stories of Arthur's bravery and goodness. Eventually he was remembered as a hero and a wise and all-powerful king.

King Arthur's followers were known as the Knights of the Round Table. They used a round table so that each would have an equally important place at the table.

The Legend of Arthur

According to the stories, Arthur was the son of King Uther Pendragon. As an infant, Arthur was given to Merlin the magician. The young Arthur pulled the sword Excalibur from the stone in which it had been magically fixed. This proved that he should be king because no one else had been able to pull the sword from the stone. In another version of the story, the Lady of the Lake handed Arthur the sword, with only her arm visible above the water.

King Arthur married Guinevere and held court at Camelot. He and his strong and brave knights all sat as equals around a great round table. They came to be known as the Order of the Round Table. Sir Lancelot was the greatest of the knights; Sir Galahad, the most noble; and Perceval, the most innocent.

Knights were soldiers who swore loyalty to a lord. The real Arthur, if he existed, lived long before the age of knighthood. Nevertheless, knights and poets of that period depicted him as a knight like themselves.

King Arthur was a mighty warrior. However, his traitorous nephew, Mordred, rose in rebellion. Arthur was badly wounded in battle. His body was carried to the island of Avalon to be healed. At some future time, according to legend, he will return to rule again.

In some stories about Arthur he and his knights sought the Holy Grail. In Christian legend, the Grail is the cup used by Jesus at the Last Supper.

According to legend, only the pure could see the Grail.

Books about Arthur

Many French and English writers of the Middle Ages wrote down Arthurian legends. Sir Thomas Malory, an English writer of the 1400s, brought together many tales in his book *Le Morte Darthur* ("The Death of Arthur"). Most modern versions are based on Malory's book.

Articles of Confederation

The Articles of Confederation were printed for everyone to read.

The Articles of Confederation served as the first constitution of the United States. The articles went into effect on

Did You Know?

An English writer named T.H. White wrote four novels about King Arthur and his court. The novels were published in one volume called *The Once and Future King* in 1958.

March 1, 1781. Soon afterward, however, the people realized that there were problems with the document. On March 4, 1789, the articles were replaced by the U.S. Constitution.

The articles were written by the representatives of the American Colonies who made up the Second Continental Congress. When the colonies declared their independence from Great Britain in 1776, they realized they needed a new plan of government. The colonies deeply resented the laws that the British Parliament had imposed on them, so they set up a weak central government. The only branch of government was a Congress with one house. Congress had power over military and foreign affairs but not over the affairs of each state. It could not enforce its powers or collect taxes.

Because of these problems, state leaders wrote a new constitution in 1787. The new constitution strengthened the federal government. It provided for executive and judicial branches and a legislature with two houses.

Artificial Intelligence

Intelligence is the ability to learn and to deal with new situations. When a computer or a robot solves a problem or uses language, it may seem to be intelligent. However, this type of intelligence is dif-

Russian chess player Garry Kasparov thinks about a move during a match against a computer. The computer, named Deep Junior, was programmed to play chess.

ferent from human intelligence. It is called artificial intelligence, or AI.

Artificial intelligence comes from sets of instructions that people write. These instructions are called programs. Computers use programs to analyze, or study, large amounts of information quickly. Then they pick answers or actions from among many choices. Computer programs can be used for playing games, making medical decisions, and translating languages.

But analyzing information is not the same as understanding a problem as humans do. Computers can only use logic, or the relationships among facts, to figure out problems. Humans use many skills besides logic when making decisions. They use such things as imagination, awareness, emotion, and values. No one knows yet whether these abilities can be programmed into a computer.

Arts

Before the 1700s the word art was often used to describe any skill that produced something. At the time both painting and farming were thought of as arts. Today people think of the arts more as forms of expression. An artist uses skill and imagination to create a product. This product often draws a response from others. These responses can include admiration of a beautiful sculpture, feelings of sadness from a moving poem, or pleasure from a funny play.

Individual arts are often grouped into categories based on similarities. Theater, dance, and music are examples of performing arts. Poetry, short stories, and novels are literature—words crafted to express ideas. Painting, drawing, sculpture, and photography are examples of visual art, or art that is enjoyed through sight. Some arts, such as architecture (the design of buildings) and motion pictures (movies), are harder to classify.

Several different types of art are on display in the Hermitage museum in Saint Petersburg, Russia.

An art form may include combinations of several other forms. For instance, an opera brings together a dramatic plot, music that is both played and sung, scenery and costumes, acting, and perhaps dance.

Art forms that result in “useful” products are sometimes called decorative arts or crafts. Furniture design, metalworking, basketry, and pottery are a few examples of decorative arts.

Ash

Several types of ash tree are valued for their hardwood or their beauty. There are about 70 different species, or types, of ash tree. They are members of the same scientific family as olive trees, jasmines, and lilacs.

Most ash trees grow in the northern half of the world. They grow best where it is neither extremely hot nor cold. They usually need plenty of sunshine.

The spreading branches of an ash tree give the tree a rounded shape.

Some ashes are considered shrubs, but most are trees. Ash trees are typically small to medium in height. However, some types may grow taller than 100 feet (30 meters). Most ashes have a strong, straight trunk with gray bark. The spreading branches usually form a rounded shape. The green leaves are made up of several parts called leaflets. In autumn the leaves of most ashes turn yellow or purple before they are shed for the winter. The flowers are usually small and grow in clusters. Each seed has a papery wing shaped like a dragonfly wing.

Several kinds of ash tree have strong, tough wood. These hardwood ashes include the white, green, black, blue, and Oregon types in North America and the European type in Europe. Their wood is used to make such products as baseball bats, hockey sticks, tennis rackets, oars, furniture, tool handles, and barrels. Ash trees are also

often planted in cities to provide shade and color.

Ashanti

The Ashanti, or Asante, people formed a powerful West African kingdom in the 1700s and 1800s. The kingdom grew wealthy from the slave trade and conquered many peoples. In 1874, however, the kingdom became a colony of Great Britain. The Ashanti territory is now part of the country of Ghana.

The rise of the Ashanti began in the 1670s, when Ashanti ruler Osei Tutu crushed all opponents in the region. He then declared himself Asantehene, or king. The next ruler, Opoku Ware, continued the Ashanti's conquests. During his reign, from 1720 to 1750, the empire reached its peak.

An Ashanti chief wears fine clothing and gold jewelry.

Throughout the 1700s, the Ashanti supplied captives to British and Dutch slave traders on the coast. In return, the Europeans provided the Ashanti with fire-arms that they used to make more conquests. Great Britain outlawed the slave trade in 1807. After that, the Ashanti had to rely more heavily on other trade items, such as gold, ivory, and cocoa.

Serious trouble came when Britain expanded its own empire inland. In 1874 British forces captured Kumasi, the capital of the Ashanti. The Ashanti soon lost their hold over the groups they had ruled over. In 1902 Ashanti lands were made part of a British colony called the Gold Coast. In 1957 the Gold Coast became the independent country of Ghana.

The Ashanti people still live in a region centered on Kumasi. Kumasi is a busy and prosperous city. But most Ashanti

live in villages. They are mainly farmers who produce plantains, bananas, cassava, yams, and cacao.

Ashe, Arthur

Tennis champion Arthur Ashe was an African American who triumphed in a traditionally white sport. He was ranked among the top 10 players in the world for 12 years.

Arthur Robert Ashe, Jr., was born in Richmond, Virginia, on July 10, 1943. He started playing tennis as a child. Between 1955 and 1963, Arthur won 11 national youth championships. At the same time, he worked hard in school. He won a scholarship to attend the University of California at Los Angeles (UCLA).

Arthur Ashe returns a ball during the U.S. National Championships in 1965.

In 1968 Ashe won the U.S. Open tournament. The tournament is one of the four major events in tennis each year. The others are Wimbledon (in England), the French Open, and the Australian Open. Ashe's win was the first ever for an African American man in one of these tournaments. Afterward, he regularly reached the semifinals and finals of the tournaments. Ashe won the Australian Open in 1970. In 1975 he won the top prize at Wimbledon.

Ashe retired after suffering a heart attack in 1979. In 1983 he had another heart attack and required surgery. It is thought that blood that he received at this time was infected with HIV. HIV is the virus that causes the disease AIDS. As a result he contracted the disease. However, he continued to display the same determination he showed on the tennis court. He took the side of refugees, underprivileged children, and people with AIDS. He died of AIDS on February 6, 1993.

Ashgabat

Population
(2007 estimate)
744,000

Ashgabat is the capital of the central Asian country of Turkmenistan. The city lies at the foot of a mountain range. It is

A statue of a horseman stands in front of a monument in downtown Ashgabat.

also at the edge of a desert, in an area called an oasis. An oasis is a part of a desert that has enough water for people to live.

Ashgabat is one of Turkmenistan's centers of industry and transportation. The city is famous for its carpet-weaving industry. It also has glassworks, cotton mills, and metalworking shops.

The city was founded in 1881 as a Russian military fort. It was called Ashkhabad. During much of the 1900s it was the capital of a republic of the Soviet Union. An earthquake destroyed much of the city in 1948, but it was rebuilt. In 1992 Turkmenistan became an independent country with Ashkhabad as the capital. The city then adopted the Turkmen version of its name—Ashgabat.

Asia

The largest and most populated continent is Asia. It has nearly one third of the world's total land area and is home to more than half Earth's people.

Land and Climate

Because Asia is so vast and varied, it is often discussed in terms of six general regions: Southwest, South, Southeast, East, North, and Central Asia. Southwest Asia consists mainly of countries on or near the Arabian Peninsula, such as Saudi Arabia, Iran, Iraq, and Israel. Most of Turkey is also included in this group. (Some of Turkey is considered part of Europe.) The countries of Southwest Asia are also part of a region known as the Middle East. Much of the land in Southwest Asia is desert.

The main geographic features of South, Southeast, and East Asia are great mountains, high plains, and islands. India and Pakistan are major countries in South Asia; Indonesia, Malaysia, Thailand, the Philippines, and Vietnam are in Southeast Asia; and China, Japan, and North and South Korea are in East Asia.

Northern Asia, also called Siberia, is part of Russia. (Russia's Ural Mountains separate Asia and Europe, so Russia is partly in Asia and partly in Europe.) Siberia has mostly frozen plains and swampy forest. Because of the extreme cold, few people live there. Most of Central Asia consists of desert, but in the north are vast grasslands.

The Tian Shan Mountains are a major feature of Central Asia.

The continent's largest deserts are the Gobi and the Takla Makan Desert in East Asia and the Thar Desert in South Asia. Many of the world's highest peaks are found in the Himalayas of South Asia. The continent's other major mountain ranges include the Hindu Kush, the Tian Shan, and the Altai, all in Central Asia. Major Asian rivers include the Yangtze and Huang He in China; the Mekong and Irrawaddy in Southeast Asia; the Ganges in India; and the Ob in Russia. Some of the world's earliest civilizations developed along the Indus River in India and the Tigris and Euphrates rivers in Southwest Asia.

The climate of Asia varies greatly. The continent has some of the hottest and

coldest places on Earth, as well as many areas in between. Cherrapunji, India, is one of the world's wettest places, averaging nearly 400 inches (1,000 centimeters) of rain per year. Southwest Asia has some of the world's driest deserts. South and Southeast Asia are hot, wet regions with two distinctive seasons: a relatively cool and dry winter and a rainy and hot summer.

Plants and Animals

Because of the wide variety of climates and physical features, there are many types of plants. In northern Siberia lichens, mosses, and some wildflowers grow. To the south are evergreen forests and grasslands. China has the most varied vegetation of any country in the world. Palm trees and bamboo grow in the southern parts of China, South Korea, and Japan. In South and Southeast Asia rain forest is the main natural vegetation, though large areas of trees have been cut down to make room for farming. In the mountains of Southwest Asia there are forests of beech trees, evergreens, hollies, and creepers.

Asia's animals are as varied as its plants. Northern Asia has polar bears, walrus, moose, and reindeer, while wild camels roam the Gobi. Asia's reptiles include crocodiles, king cobras, and Komodo dragons. Animals found only in Asia include the orangutan, giant panda, Asian elephant, Siberian tiger, Bengal tiger, and Indian rhinoceros. However, the population of many animals in Asia has been reduced because of the destruction of animal habitats and uncontrolled hunting.

People

Many different groups of people live in Asia. Arabs, Jews, Iranians, and Turks are among the peoples of Southwest Asia. South Asia is home to Indian peoples. Southeast Asia's wide variety of peoples and cultures has been influenced by India and China. The main peoples in East Asia are the Chinese, Japanese, and Koreans. Northern Asia includes various Asian groups, as well as Russians and other Europeans.

Hundreds of different languages can be heard throughout the continent. More than 250 languages are spoken in Indonesia alone. Some of the most widely used languages in Asia include Arabic, which is spoken in parts of Southwest Asia; Hindi, spoken in India; and Chinese (Mandarin), spoken in China. Russian, English, and French are also spoken.

The world's major religions—Buddhism, Hinduism, Islam, Judaism, and Christianity—all started in Asia. Today, many people in Southeast and East Asia follow Buddhism. Hinduism is the main religion in India and Nepal, while Islam is practiced in much of Southwest Asia and in Indonesia, Malaysia, Pakistan, and Bangladesh. Judaism is the main religion in Israel. Christianity is practiced throughout the continent, but only in the Philippines, Russia, and Armenia is it the main religion.

Hong Kong, Israel, Japan, Singapore, and South Korea have excellent education and health care systems. But

most of the rest of Asia is still developing. The living standards of many people are behind those in the Western world. In general, problems with nutrition are common. Health and education services are limited and are generally more available in cities than in rural areas.

Economy

Agriculture is an important part of the economy in many Asian countries. In much of Asia the main food crop is rice. Wheat is important in parts of Northern, Central, Southwest, and South Asia. Crops grown for sale include tea, sugarcane, coconuts, and rubber. Sheep and goats are raised for meat and wool in most of Asia. China, Japan, Indonesia, India, and Russia catch large amounts of fish.

Asia has large reserves of almost every important mineral. The continent has more than half the world's reserves of

The religion of Buddhism was founded in India and soon spread throughout Asia. The Kiyomizu Temple is one of the most famous Buddhist temples in Japan.

A fisherman casts his net into the Mekong River in Southeast Asia.

coal, mostly in China, Siberia, and India. Major deposits of oil are found in Saudi Arabia, Iran, Iraq, the United Arab Emirates, and Qatar. Asia also produces large amounts of iron ore, cast iron, tin, tungsten, and refined zinc.

Asia's industrialized areas, including Japan, South Korea, Taiwan, and Singapore, make a wide variety of products. China and parts of South and Southeast Asia began developing their manufacturing in the late 20th century. South and Southeast Asia produce traditional goods such as textiles as well as technology products such as computers. Oil and gas are processed in Southwest and Central Asia.

History

Asia was home to three of the world's first civilizations, which developed written languages and built large cities. The first such society developed in Southwest Asia in a region called Mesopotamia in about 3500–3000 BC. A civilization developed in the Indus River valley in what is now Pakistan by

about 2500 BC. Historians believe that Chinese civilization began in about 2500 BC as well.

Over time these civilizations changed as they were taken over by other groups. The Mesopotamian kingdoms became part of the Greek and Persian worlds. In the AD 600s Islam was founded in Arabia. Arab Muslims took over Mesopotamia and then moved into other parts of Asia.

The Indus Valley civilization died out in about 1700 BC. At about this same time, a people known as Aryans invaded what is now India. Their religion eventually evolved into Hinduism. The Mauryan Empire united South Asia in about 300 BC, though others eventually took over from them. In the late AD 1100s Muslim rulers took over part of the region.

Chinese culture dominated East Asia. China was ruled by a series of dynasties for thousands of years, from about the 1700s BC to the AD 1900s. The Mongols, a people from Northern and Central Asia, ruled much of Asia during the AD 1200s and 1300s.

To take control of Asia's vast wealth, Europeans conquered many Asian countries and made them into colonies in the 1800s. By the end of World War II, the colonies began to seek independence. India became free of British rule in 1947. France fought to keep control of its colonies in Southeast Asia but finally withdrew from the region in 1954. Most

Central Asian countries were part of the Russian Empire and later the Soviet Union. They became independent after the breakup of the Soviet Union in 1991.

China also underwent major changes. In 1912 the last dynasty came to an end, and the country became a republic. China's government became Communist after Communists won a civil war in 1949.

Communists in Korea and Vietnam also fought for control of those countries. The Korean War, from 1950 to 1953, resulted in the separation of Korea into two countries: North Korea and South Korea. North Korea had a Communist government, but South Korea did not. The Vietnam War ended in 1975 with Vietnam united under a Communist government.

In 1948 the country of Israel was created in the Middle East as a homeland for the Jewish people. Arab countries opposed the creation of Israel, however, and they and the Israelis fought a series of wars. Southwest Asia was the site of several other conflicts, including the Iran-Iraq War (1980–88), the Persian Gulf War (1991), and a U.S.-led invasion of Iraq (2003).

In the last half of the 1900s, many Asian countries had to deal with problems left over from the period of European rule. The boundaries of the European colonies did not always match the natural divisions of peoples, cultures, and physical regions. When

Asia Minor

Asia Minor is the place where the continents of Asia and Europe meet. It is also known by its Greek name, Anatolia. In the past Asia Minor was a meeting point for travelers passing between Asia and Europe. Today it is part of the country of Turkey.

Asia Minor is a peninsula, or a piece of land surrounded by water on three sides. The Black Sea lies to the north. The Aegean Sea lies to the west. The Mediterranean Sea is to the south. The peninsula extends westward from Asia toward Europe.

Asian Americans

Asian Americans are people in the United States whose ancestors came from Asia. Many Asian Americans were born in Asia and later moved, or immigrated, to the United States. However, many other Asian Americans were born

in the United States. Their families often have been in the country for several generations.

Asian Americans have roots in many different countries. The largest groups of Asian Americans have ancestors from China, the Philippines, India, Vietnam, Korea, or Japan. Many other Asian Americans have ancestors from Cambodia, Laos, Pakistan, or Thailand. Smaller groups of Asian Americans have roots in many other Asian countries. (A tiny group has roots in the part of Asia called the Middle East. However, many of these people are better known as Arab Americans.)

Early Asian Immigrants

Asians did not start immigrating to the United States until the 1800s. Workers from China began arriving in the United States in about 1820. A gold rush in California in the mid-1800s brought many more Chinese people to the West Coast. In the 1860s about 15,000 Chinese workers helped to build the transcontinental (cross-country) railroad. Almost all the early Chinese immigrants were young men. Many came to earn money but planned to return to China. Others decided to stay.

Meanwhile, in the 1850s and 1860s, people from China and Japan began arriving in Hawaii. They came mainly to work on sugar plantations, or large farms. Thousands more Japanese arrived in Hawaii during the 1880s. In the early 1900s workers from Korea and the Philippines also came to work on Hawaii's plantations.

Did You Know?

People called the Hittites lived in Asia Minor from about 1700 to 1180 BC. After that many different groups ruled the area. It became part of the Republic of Turkey in 1923.

Chinese New Year festivities attract crowds to the neighborhood called Chinatown in Chicago, Illinois.

During the late 1800s and early 1900s, many immigrants from Japan, Korea, and the Philippines settled on the West Coast. Smaller numbers came from India. Many Asian immigrants worked on farms in California.

Discrimination

Asian immigrants often faced discrimination, or unfair treatment, from whites. In addition, the U.S. government did not allow them to become U.S. citizens. This meant that Asian immigrants did not have the same rights as immigrants from Europe.

Eventually, the government passed laws to stop Asians from immigrating to the United States. In 1882 the U.S. Congress passed the Chinese Exclusion Act. This law stopped Chinese people from immigrating to the United States. The Immigration Act of 1924 stopped all immigration from Asia.

Despite this discrimination, many Asian Americans started families, set up busi-

nesses, and built communities in the United States. Their children, born in the United States, became U.S. citizens. Many Asian Americans served in the U.S. military.

Japanese Internment

In 1941 Japan bombed the U.S. military base at Pearl Harbor in Hawaii. The United States then joined World War II. During the war, the U.S. government saw all Japanese Americans as possible

A Japanese American family has their bags packed for their move to an internment camp.

enemies. It distrusted even those who had been born in the United States and were citizens.

The government forced Japanese Americans on the West Coast to move to special camps, called internment camps. These Japanese Americans lived in the camps until the war ended in 1945. They lost their jobs and often their land, homes, and businesses. Even so, thousands of Japanese Americans—and other Asian Americans—served in the U.S. military during the war.

Did You Know?

Norman Y. Mineta was the first Asian American to head a U.S. government department. He served as Secretary of Commerce and later as Secretary of Transportation.

In 1989 Congress apologized to Japanese Americans for their treatment during World War II. The government also gave 20,000 dollars to each surviving internee.

New Laws and New Immigrants

Following World War II Congress passed laws that led to fairer treatment of Asian Americans. A law called The Immigration and Nationality Act of 1952 gave all Asian immigrants the right to become U.S. citizens. The Immigration Act of 1965 allowed people from any Asian country to immigrate to the United States.

After 1965, many new Asian immigrants came to the United States. Many came from Korea and countries in Southeast Asia, especially Vietnam. These immigrants often were escaping wars in their homelands. But Asian immigrants also came to find work. For example, great numbers of Indians came to work in the

Asian American architect and artist Maya Lin stands beside one of her works. Lin is famous for designing the Vietnam War Memorial in Washington, D.C.

United States as doctors, scientists, engineers, or computer specialists.

Asian Americans Today

By 2000 there were more than 10 million Asian Americans in the United States. They made up about 4 percent of the U.S. population. About half of them lived in the West, especially in Hawaii and California. In the East, New York had the highest number of Asian Americans. More than 65 percent of the Asian Americans in 2000 were U.S. citizens.

Some Asian Americans today feel that other Americans still treat them as outsiders. Nevertheless, many Asian Americans have achieved high levels of economic and educational success. Asian Americans continue to be an important part of U.S. society, as they have been for more than 150 years.

Asmara

Population
(2002 estimate)
500,600

Asmara is the capital of the East African country of Eritrea. It is also the country's largest city. Located in a highlands region, Asmara is more than 7,500 feet (2,300 meters) above sea level.

Asmara is a major market for farm products. It is also a center for tanning hides. Factories in the city make textiles, footwear, and soft drinks. Roads, railroads, and airplane routes connect Asmara to a port on the Red Sea.

Asmara was once a small village of the Tigre people. In 1900 it became the capital of the Italian colony of Eritrea. In 1935 Italy invaded Ethiopia. The Italians made Asmara the main base for the attack. Afterward Asmara was the leading city in the territory called Italian East Africa. Later the British and then the Ethiopians controlled Eritrea. In 1993 Eritrea won its independence, and Asmara became its capital.

Asparagus

People have been eating asparagus as a vegetable since ancient times. The veg-

Tender asparagus spears shoot up from the ground in spring and early summer.

etable is also called garden asparagus. This helps to separate it from the hundreds of other types of asparagus plants. All asparagus plants belong to the lily family, along with onions and garlic.

Asparagus grows wild in parts of Europe, Africa, and Asia. Farmers and gardeners grow the vegetable in areas where the winters are cool or cold. The world's leading asparagus producers are China, Peru, and the United States.

People eat the young shoots of the asparagus plant, which are called spears. The spears shoot up from the roots during the spring and early summer. They must be picked by hand, not by machine. That makes asparagus an expensive crop to grow.

The spears of the asparagus plant are normally green. That is because they contain chlorophyll, the substance that uses light energy to make food for plants. Some growers in France and other places bury the growing spears in

soil. This shields them from the sun and prevents them from making chlorophyll. Spears grown this way are white. White asparagus is known for its delicate flavor.

People usually eat asparagus spears cooked. They are often served hot with melted butter or a rich sauce. The spears are also eaten cold in salads.

Aspen

The trees called aspens are known for their fluttering leaves. Their leaf stalks are long, weak, and flattened. They allow the leaves to move in even the slightest breeze.

Aspens belong to the group of trees called poplars. The poplars are closely related to willow trees. There are three species, or types, of aspen. The European aspen grows in Europe, northern Africa, and Asia. The quaking, or trembling, aspen and the big-tooth aspen are found in North America.

The quaking aspen grows in more areas of North America than any other kind of tree.

The bark of aspens is usually smooth and greenish gray or white. Aspen leaves are rich green. In autumn the leaves turn bright yellow before they fall off the tree. The European aspen and the quaking aspen can reach a height of 90 feet (27 meters). The big-tooth aspen can grow to about 59 feet (18 meters).

Aspens can reproduce both by producing seeds and by growing new sprouts. A single aspen can produce more than 50 million seeds each season. Aspens also grow sprouts from their own roots. These sprouts grow into new trees. Root reproduction makes it hard to get rid of aspens. If people cut down a batch of aspens, new aspen sprouts will shoot up if the roots still exist.

People use aspens to make paper. They also value aspens for their shade and beauty.

Assassination

The murder of a public figure is called assassination. Many world leaders have been killed in this way, mostly for political reasons. In the 1900s ordinary citizens and military personnel also became targets of assassins.

Assassination is an ancient crime. The Roman ruler Julius Caesar was killed on March 15, 44 BC, by political enemies. However, the word assassin was not used until the Middle Ages. It comes from a word that means “hashish smokers” and

Both Indira Gandhi and her son Rajiv served as prime ministers of India. Indira Gandhi was assassinated in 1984. Rajiv Gandhi became prime minister after her assassination. Later he was also killed.

refers to an Islamic group that existed between the 1000s and the 1200s. According to legend, the members of this group were given the drug hashish to make them into fearless killers of their religious rivals.

Assassins strike for various reasons. Some feel that they were mistreated in some way. For example, U.S. president James A. Garfield was killed in 1881 by a man who was angry that he did not get a political job. Others disagree with the victim's beliefs or with a public stand that the victim has taken on a particular issue. The Egyptian leader Anwar el-Sadat was assassinated by people who were angry with him for signing a peace treaty with Israel. The U.S. civil rights leader Martin Luther King, Jr., was killed by a man who disagreed with the cause of civil rights.

Still other assassins want to call attention to a cause or make a political statement. U.S. president William McKinley died

after being shot on September 6, 1901. His killer was an anarchist—a person who wanted to do away with governments. Anarchists also killed several heads of state in Europe in the early 1900s. Some hoped to change the course of history.

One particular assassination had far-reaching effects. The assassination of Archduke Francis Ferdinand of Austria-Hungary in 1914 helped to bring about World War I.

Assiniboin

The Assiniboin (or Assiniboine) tribe of Native North Americans were originally

An Assiniboin chief wears the traditional clothing of his tribe.

Did You Know?

The Assiniboin were friendly with the Cree. Their enemies were the Blackfoot and the Dakota Sioux.

part of the Yanktonai Dakota (Sioux) people. In the 1600s, they split from the Yanktonai and moved west into what are now the states of Montana and North Dakota and the Canadian provinces of Saskatchewan and Manitoba.

The Assiniboin's name came from an Ojibwa Indian word meaning "one who cooks with stones." This was because they used stones heated in a fire to boil cooking water.

The Assiniboin spent much of their time hunting bison (buffalo). Bison meat was their main source of food, and they used bison hides to make their clothing and shelter.

By the late 1600s, the French and the English began building trading posts near the Assiniboin's territory. The Europeans brought with them diseases such as measles and smallpox, which killed many members of the tribe.

Weakened by disease and warfare, in 1851 the Assiniboin agreed to give up much of their traditional territory to the U.S. government in exchange for reservation lands. The Assiniboin in the United States eventually settled on two reservations in Montana. Those in Canada moved to several reserves in Alberta and Saskatchewan. By the end of the 20th century, there were about 5,000 Assiniboin living in the United States and about 3,000 in Canada.

Asteroid

Asteroids are small, rocky bodies that orbit, or travel around, the sun. They are also called minor planets or planetoids. In general, they are materials left over from when the planets formed. They are also created

The asteroid called Gaspra is about 12 miles (20 kilometers) long.

when other bodies in space collide and break apart. Most asteroids travel around the sun in a loose path that falls between the orbits of the planets Mars and Jupiter. Astronomers identified the first asteroids in 1801.

Asteroids are much smaller than planets. The largest asteroids are between 62 miles (100 kilometers) and 620 miles (1,000 kilometers) across. Millions of asteroids are the size of large boulders. Asteroids can be almost any shape. Some are nearly round while others are irregularly shaped chunks. Asteroids are made up of stone and metal.

Many small asteroids enter Earth's atmosphere each day. Almost all burn up before they hit the ground. As they burn they create a streak of light called a meteor. An asteroid that survives the fall through the atmosphere and reaches Earth's surface is called a meteorite.

Asthma

Asthma is a long-term medical condition that affects a person's lungs. From time to time people with asthma suffer attacks, or episodes of sickness, in which they find it difficult to breathe. People can get asthma at any age. It is one of the most common long-term health problems in children. Asthma in children usually begins by the age of 5.

Symptoms

The symptoms, or signs, of an asthma attack include coughing and the feeling of not getting enough air. Wheezing, or breathing that makes a whistling sound, is also common. Asthma attacks usually last from about 30 minutes to several hours. The symptoms can range from mild to serious. In rare cases an asthma attack can lead to death.

A child uses an inhaler. An inhaler is a device that quickly delivers medicine to the lungs of a person with asthma.

Causes

An asthma attack results from changes in the small tubes in the lungs that carry air. During an attack the muscles around these airways tighten. This makes it harder for air to pass through. The tubes also swell up. This leaves less space inside for the airflow. In addition, the tubes fill up with extra amounts of a thick fluid called mucus.

Scientists do not know exactly why people get asthma. But once people have the condition, their bodies tend to overreact to certain things called triggers. The triggers vary from person to person. For some it may be exercising. For others, breathing polluted air or getting a cold may bring on an asthma attack. Sudden weather changes can cause attacks, too.

Asthma attacks are also often associated with allergies. Allergies are a body's negative reactions to certain substances. Things that cause allergic reactions may trigger asthma attacks, too. These things include plant pollen, mold, and tiny insects that live in house dust.

Treatment

There is no cure for asthma. However, several medications can help prevent asthma attacks. Other medicines can quickly relieve the symptoms of an attack. People with asthma also try to avoid the things that trigger their attacks.

Astronomy

Astronomy is one of the oldest sciences in the world. The study of astronomy involves all of the objects outside Earth's atmosphere. These include the sun, Moon, planets, stars, galaxies, and all other matter in the universe. People known as astronomers have studied these objects for thousands of years.

Study of Astronomy

Astronomers study the universe in different ways. Some are professionals, meaning that they make their living at the work. Others study objects in space as a hobby. They are known as amateur astronomers.

Some astronomers work in laboratories. There they study actual samples of objects that have been collected by spacecraft. These include meteorites,

An astronomer points a telescope toward the evening sky.

Astronomers study everything they can see or detect in the sky. Some astronomers study the oddly shaped clouds of gas and dust called nebulae.

rock samples from the Moon, and dust particles.

Many astronomers observe distant objects with the help of telescopes. Telescopes range in size. Some are small enough to be carried by hand. Large telescopes are often housed in buildings known as observatories. The Hubble Space Telescope is in orbit around Earth as a floating observatory. The Hubble magnifies and records images of distant space objects. It then sends the information to astronomers on Earth.

Astronomers also use cameras and other instruments to record information about

distant objects. Photographs provide astronomers with a visual record of their observations. Other instruments can help reveal faint, hard-to-detect objects in outer space. These instruments measure the light and other radiation coming from the objects.

Some Early Astronomers

Thousands of years ago there were no calendars or clocks. People kept track of time by watching the sun and the stars. It was important for them to know the time in order to sow their crops and reap their harvests. These people were the first astronomers.

The most influential ancient astronomer was Ptolemy of Alexandria in Egypt. He lived in the AD 100s. He developed the idea that Earth occupies the center of the universe. He thought that the other objects revolved around Earth. Most people believed this idea of Ptolemy's for more than a thousand years.

In 1543 Nicolaus Copernicus published a revolutionary new theory. He believed that Earth and the other planets revolve around the sun. Copernicus was criticized because he challenged Ptolemy's theory. Galileo Galilei, a great Italian scientist and astronomer, supported Copernicus' theory with his observations.

Later astronomers made new discoveries that also supported Copernicus' idea. In the early 1600s Johannes Kepler explained how the planets travel around the sun. In 1687 Isaac Newton learned about gravitation and motion. His work reinforced Kepler's laws. Today astrono-

Athapaskan

The Athapaskan (or Athabascan) were a large group of Native American tribes who spoke similar languages. They traditionally lived in northwestern North

An Athapaskan child shows his drawings of reindeer.

America. Before 1400 some Athapaskans, including the Navajo and the Apache, moved to what is now the southwestern United States. Others migrated to the Great Plains or the Pacific coast. Today the name Athapaskan is usually used for tribes who stayed in northern Canada and Alaska. They include the Chipewyan, the Han, and the Kutchin.

The Athapaskan lived in forests in areas with long, snowy winters. They fished and hunted for animals such as deer, moose, rabbits, and squirrels. They prized the reindeer for its skin and fur as well as its meat. The Athapaskan also gathered plants.

Living in such a cold environment, the Athapaskan spent most of the year in a constant search for food. They traveled in small family groups. While hunting they lived in portable, cone-shaped dwellings that resembled the tepees made by Plains Indians. They used dogsleds to carry their belongings over snow and ice.

For many years only a few French, English, and Russian fur traders entered Athapaskan lands. In the late 1800s many more people arrived in search of gold. The newcomers brought change, but traditional ways survived. In the late 20th century more than 40,000 Athapaskan lived in Alaska and northern Canada, where they are called Dene.

Athena

In ancient Greek mythology Athena was the goddess of war, wisdom, and handi-crafts. She was one of the 12 gods believed to live on Mount Olympus. She is associated with the Roman goddess

Minerva because they shared many of the same characteristics. Athena's symbols were the olive tree, which represents peace, and the owl, which represents wisdom.

According to legend, Athena was the favorite daughter of Zeus, the chief god. She was said to have sprung from his head fully grown and clothed in a suit of armor. Like Zeus, Athena wore the aegis, which was a magical breastplate fringed with snakes. It produced thunderbolts when shaken.

Athena was very different from the war god Ares, who was a powerful fighter. Athena used her great wisdom to advise soldiers during wartime. She believed that war should be used only to protect people and to provide justice. In addition, she was known for inventing the plow, taming wild horses, and teaching farmers to yoke oxen. It was also believed that she invented the flute and the trumpet.

The city of Athens was associated with Athena. According to legend, Zeus decided to give the Greek city to the god who offered the most useful gift to the people. Poseidon, the god of the sea, gave the city a water spring. Athena struck the ground with her spear and caused an olive tree to grow. The people were delighted with this gift. Zeus awarded the city to Athena. He named it Athens in her honor.

Athens

Population
(2001 census),
city, 745,514;
metropolitan
area,
3,187,734

Athens is the capital of Greece, a country of southern Europe. The city is located on the Greek mainland. Mountains surround Athens on three sides. Athens was the most important of the city-states of ancient Greece.

Places of Interest

Parts of many ancient buildings still stand in Athens. On top of a high hill is an ancient fortress known as the Acropolis. It once held temples to Athena, the ancient Greek goddess of wisdom. The city of Athens was named for Athena.

Ruins of ancient monuments stand near modern neighborhoods in the city of Athens, Greece.

Economy

Athens is the main center in Greece for business, trade, and transportation. The city has a busy port on a bay of the Aegean Sea. Most of Greece's manufactured goods are made in Athens. Some of the main factories process food and beverages. Other factories make cloth, soap, chemicals, pottery, ships, and cars. Tourism and publishing also are major industries.

History

People have lived in the Athens area for at least 5,000 years. The earliest surviving buildings date from about 1200 BC.

Ancient Greece was made up of many independent city-states. Athens reached its peak as one of the most powerful city-states in the 400s BC. The leader of Athens during that period was Pericles. He helped develop the form of government known as democracy. Athens also thrived in the 400s BC as a center of culture and learning. The city was home to great playwrights, historians, and scholars.

After Athens lost a war in 404 BC, its power began to decline. Later the Macedonians and then the Romans controlled the city.

The Turkish Ottoman Empire took control of Athens in AD 1456. The Turks ruled the city until 1833. In that year Greece became an independent country, with Athens as its capital. In the second half of the 1900s the city grew rapidly.

In 2004 Athens hosted the Summer Olympics.

Atlanta

Population
(2000 census),
city, 416,474;
(2007 estimate)
519,145

Atlanta is the capital and largest city of the U.S. state of Georgia. It is located in the foothills of the Blue Ridge Mountains.

The Fountain of Rings is part of Atlanta's Centennial Olympic Park. The park was built for use during the 1996 Summer Olympic Games.

Did You Know?

The Jimmy Carter Library and Museum opened in Atlanta, Georgia, in 1986. It houses the official documents as well as letters and photographs of the 39th president of the United States.

Atlanta is the main trade and transportation center for the southeastern United States. The city is also an important financial center. The U.S. government has several offices in Atlanta.

The city had its beginnings in 1837. That year the site was selected as the end stop on a new rail line. A settlement soon grew up around the site. In 1845 it was named Atlanta.

During the American Civil War Atlanta became a rail center for the Confederate states. In 1864 Union troops captured Atlanta and burned most of its buildings. After the war ended, Atlanta recovered quickly. The city became the capital of Georgia in 1868.

In the 1900s Atlanta was the home of the civil rights leader Martin Luther King, Jr. It was also the first major Southern city to elect an African American man (in 1973) and African American woman (in 2001) as mayor. The 1996 Summer Olympics were held in Atlanta.

Atlantic Ocean

The Atlantic Ocean is the second largest ocean on Earth, after the Pacific Ocean. However, the Atlantic drains more of the world's land area than any other ocean. This means that much of the world's river water flows into the Atlantic. The ancient Greeks named the ocean after Atlas, a character in Greek mythology. Atlas stood on pillars in the ocean to hold up the heavens.

Physical Features

The Atlantic Ocean reaches the continents of Europe and Africa to the east. It extends to North America and South America to the west. It also extends from the Arctic Ocean in the north to Antarctica in the south. The equator divides the Atlantic Ocean into parts called the North Atlantic and the South Atlantic.

The surface area of the Atlantic is about 31,830,000 square miles (82,440,000 square kilometers). This is roughly half the size of the Pacific Ocean. The Atlantic's deepest point, at 27,493 feet (8,380 meters), is the bottom of the Puerto Rico Trench, north of the island of Puerto Rico.

Beneath the middle of the Atlantic is a long, undersea mountain range called the Mid-Atlantic Ridge. Along the ridge, hot, liquid rock, called magma, rises from beneath Earth's crust. The magma

cools and hardens as it spreads out on both sides of the ridge. Volcanoes and earthquakes are common near the ridge.

Undersea volcanoes have formed some of the Atlantic's islands. Examples include the Cape Verde Islands, near Africa, and Bermuda, near North America. Iceland is a volcanic island that rises from the Mid-Atlantic Ridge.

Other Atlantic islands are parts of the same land as nearby continents. Examples include the islands of Great Britain, near Europe, and the Falkland Islands, near South America.

Currents and Climate

The waters of the ocean move in patterns called currents. Currents carry heat and affect climate. In general, the main currents of the Atlantic Ocean move in a clockwise direction in the northern part of the ocean. In the southern part they move in a counterclockwise direction. At the equator, the currents move from east to west. There the water picks up heat. The water then slowly cools as the currents move away from the equator.

A hurricane swirls off the eastern coast of the United States. Hurricanes often form over the warm waters of the Atlantic Ocean.

Large, circular storms called hurricanes often develop in the warm parts of the Atlantic. Hurricanes usually hit coastal areas in the Caribbean Sea and southeastern North America.

Economy

The Atlantic produces much of the world's fish. The ocean is also a source of many minerals. Large deposits of oil, natural gas, and coal are found in the Atlantic. In addition, many cargo ships use the ocean as a trade route.

Exploration

The ancient Egyptians, Celts (Europeans), Phoenicians (Middle Easterners), and Romans sailed on the Atlantic. No one knows how far west they went, however. In about AD 1000 Vikings from northern Europe crossed the Atlantic. They probably reached the island of Newfoundland, off the coast of North America.

In 1492 Christopher Columbus made his famous voyage across the Atlantic in search of a new trading route to Asia. In 1520 Ferdinand Magellan sailed around South America. He discovered the strait (passage), now named after him, that links the Atlantic and Pacific oceans.

Environmental Issues

Humans have heavily polluted some areas of the Atlantic Ocean. This pollution includes sewage from cities, waste from factories, and fertilizers and pesticides from farms. Oil spills from ships or offshore oil wells are sources of pollution, too.

Overfishing is another important environmental issue in the Atlantic. So many fish have been caught that some types are in danger of disappearing entirely. Some countries have set limits on how many fish can be caught in certain areas. They have also set up programs to protect the fish that are left and to rebuild the fish populations.

Atlas

In ancient Greek mythology Atlas was doomed to carry the heavens on his shoulders. In some stories, he had to support the pillars that separate heaven and Earth. Artists often pictured him carrying the heavens or a globe.

Atlas' mother was Clymene, a minor goddess known as a nymph. His father was Iapetus, a Titan. The Titans were giants who ruled the world. Atlas fought with the Titans in a war against Zeus. When Zeus won the war, he became chief god. Zeus punished Atlas by making him hold up the sky.

Another story told that Atlas was the father of nymphs called the Hesperides. They guarded a tree that bore golden apples. The hero Heracles (Hercules) had to perform 12 tasks to make up for killing his children. One of these tasks was to steal the golden apples. Heracles asked Atlas to help. He offered to carry the heavens for Atlas while Atlas got the apples. Atlas agreed and fetched the apples. He planned to refuse to take

back the heavens. But Heracles tricked Atlas into picking up his burden again.

In another story Perseus turned Atlas into a mountain by showing him the head of the monster Medusa. The Atlas Mountains of Africa were named for him.

Atlas

An atlas can teach children about the world.

An atlas is a bound collection of maps. Atlases vary in size and in the information presented. Some travelers carry small atlases that give road and street directions. Other atlases are huge, very detailed books that need a reading stand for support. A general reference atlas focuses on place locations. A special-subject atlas deals with a single subject, such as agriculture or climate.

In Greek mythology Atlas was a giant condemned to hold up the heavens. In the 1500s a man named Gerardus Mercator put together a collection of maps. His collection included a picture of Atlas holding a globe on his shoulders. From then on, the word atlas was commonly used to describe a collection of maps.

Map and Globe

Atmosphere

The atmosphere is the layer of gas that surrounds Earth. It is often called air.

Other planets, and some of their larger moons, also have atmospheres.

Earth's atmosphere consists of several different gases. The gases are held close to Earth by a force called gravity. Near Earth's surface, the atmosphere is about three fourths nitrogen and one fifth oxygen. At higher elevations, the atmosphere is mostly hydrogen and helium. Surprisingly, air has weight. It is heaviest at sea level. There the gas particles are pressed together by the weight of the air above them. Air becomes lighter away from Earth's surface.

Scientists divide the atmosphere into five regions, or layers. The layer closest to Earth is the troposphere. It extends up to about 6 miles (10 kilometers) above Earth's surface. Most of Earth's weather, including the wind and most clouds, exists in the troposphere.

The second layer, the stratosphere, extends to about 30 miles (50 kilometers) above Earth's surface. The stratosphere includes the ozone layer. Ozone blocks much of the sun's radiation that would harm plants and animals if it reached Earth.

The third layer is the mesosphere. It extends up to about 50 miles (80 kilometers) above Earth's surface.

The fourth layer, the thermosphere, ranges from about 50 to 300 miles (80 to 480 kilometers) above Earth.

The fifth and highest layer of the atmosphere is the exosphere. This layer ends

Did You Know?

The atmosphere protects Earth's surface from being hit by objects from outer space. These objects are called meteoroids. Most burn up as they enter the atmosphere.

where Earth's gravity is too weak to prevent particles of gas from drifting into space.

Atom

The tiny particles called atoms are the basic building blocks of all matter. Atoms can be combined with other atoms to form molecules, but they cannot be divided into smaller parts by ordinary means.

The word atom comes from the Greek word *atomos*, meaning “indivisible.” The ancient Greeks were the first to think of the atom as the basic unit of all matter. It was not until the early 1800s, though, that scientists began to understand how atoms work.

Structure

Each individual atom is made up of smaller particles—electrons, protons, and neutrons. These are called subatomic particles. At the center of an atom is a nucleus. The nucleus consists of protons and neutrons. Protons carry a positive electrical charge, while neutrons carry no electrical charge. Together, protons and neutrons are called nucleons. Surrounding the nucleus is a cloud of negatively charged electrons.

Scientists believe that subatomic particles—protons, neutrons, and electrons—are themselves made up of smaller substances. The substances are called quarks and leptons.

Properties

The single most important thing to know about an atom is how many protons it has in its nucleus. This is known as its atomic number. The atomic number determines what kind of atom it is. Every atom is associated with a specific chemical element. An atom is the smallest unit of an element, and each chemical element has a unique atomic number. For instance, hydrogen has an

Helium

Carbon

All atoms have the same basic parts. These are a nucleus and at least one particle called an electron. The nucleus contains protons and neutrons. Diagrams of two kinds of atoms show that each kind of atom has a different number of electrons.

atomic number of 1 because every hydrogen atom has one proton in its nucleus. No other element has an atomic number of 1.

Another property of atoms is their atomic weight. This is roughly equal to the total number of protons and neutrons in an atom. Atoms that have the same atomic number but different atomic weights are called isotopes. Carbon-12, the ordinary form of carbon, has six protons and six neutrons per atom. Carbon-14 is an isotope with eight neutrons per atom. It still has six protons. If it did not have six protons, it would not be carbon.

An ordinary atom has an equal number of protons and electrons. This means that the positive and negative charges are balanced. Some atoms, however, lose or gain electrons in chemical reactions or in collisions with other particles. Ordinary atoms that gain or lose electrons are called ions. If a neutral atom loses an electron, it becomes a positive ion. If it gains an electron, it becomes a negative ion.

Attucks, Crispus

An event called the Boston Massacre helped to turn American colonists

Did You Know?

One proton is about as heavy as 2,000 electrons.

Crispus Attucks

against British rule, leading to the American Revolution. Crispus Attucks was killed by British soldiers during the massacre, and many consider him to be the first person to lose his life in the struggle for independence.

Crispus Attucks was of African and Native American ancestry. He was born in about 1723 and probably grew up in a Natick Indian settlement. He may have escaped from slavery in 1750. Most likely he became a sailor on whaling ships.

By 1770 many people in Boston, Massachusetts, were unhappy with British rule. When a crowd gathered on March 5 to challenge British troops, Attucks quickly came to the front of the group.

As the Americans waved their weapons and shouted, the British opened fire.

Attucks was shot twice. He was the first to die, but four others were also killed and six were injured.

Attucks was immediately recognized as a hero. It is said that 10,000 people joined his funeral procession. In 1888 Attucks was honored with a monument in Boston.

Augustus

The first emperor of Rome was Augustus. During his long reign the Roman world entered an era of wealth, peace, and cultural achievement that became known as the Augustan Age.

Augustus was born on September 23, 63 BC. His original name was Gaius Octavius. He was related to Julius Caesar, the Roman leader who was murdered in 44 BC. After Caesar's death he found out that Caesar had chosen him to be the next leader. From then on he was called Octavian.

Other leaders challenged Octavian for power. He finally defeated the last of

these—Mark Antony—in 31 BC.

According to historians, Octavian's victory over Antony marked the beginning of the Roman Empire. Octavian then controlled the whole Roman world. In 27 BC the Senate gave him the title Augustus (the exalted or sacred one).

Augustus' armies conquered more territory for the Roman Empire until the Germans stopped them in AD 9. Augustus then focused on improving Rome. He founded cities, built roads, encouraged agriculture, and promoted the arts. Augustus died on August 19, AD 14. Tiberius, his adopted son, then took over as emperor.

Aurora

Auroras are dazzling displays of colored light that sometimes appear in the night sky. They occur in Earth's far northern and far southern regions. In the Northern Hemisphere such a display is known as aurora borealis, or the northern lights.

An aurora lights up the sky over Churchill, Manitoba, a city in northern Canada.

In the Southern Hemisphere it is called aurora australis, or the southern lights.

Auroras take many shapes and forms, with arcs and rays of colored light being the most common. The light may also look like shimmering curtains, bands, waves, or clouds. An aurora constantly changes shape as the light moves across the sky. The light also may brighten and fade.

Auroras are caused by the sun. The sun sends out a stream of electrically charged particles called the solar wind. The solar wind travels from the sun toward Earth at great speed.

Earth is a huge magnet surrounded by a magnetic field. Earth's magnetic field forces the charged particles in the solar wind toward the planet's northern and southern polar regions. The particles move downward through Earth's upper atmosphere. As they do, they crash into atoms and molecules of gases such as oxygen and nitrogen. These collisions cause the atoms and molecules to give off light. This light is an aurora.

An aurora's colors are determined by the different gases that give off the light. They also depend on the height of the gases. An aurora usually begins as white light. Then the light turns yellowish green. This color is produced by oxygen. Higher up, oxygen gives off red light. Nitrogen produces blue or violet light.

Austin

Population
(2000 census),
city, 656,562;
(2007 estimate)
743,074

Austin is the capital of the U.S. state of Texas. The city is located on the Colorado River.

Companies that make computers and other high-technology products are important to Austin's economy. Other companies in Austin provide business services. Many city residents work in government offices or in health care or education.

Austin began as the village of Waterloo in the 1830s. In 1839 the village became the capital of the Republic of Texas. It was then renamed in honor of Stephen Austin, who started early settlements in Texas. In 1845 Texas became a U.S. state, with Austin as its capital.

The first railroad service to Austin began in 1871. That helped the city grow as a trading center for ranchers and farmers. In the early 1900s people started building factories in Austin. Later many high-technology industries moved to the city. As a result, the city's population grew rapidly.

Texas

Did You Know?

Auroras are named after Aurora, the ancient Roman goddess of the dawn.

Australia

Australia is the only country that takes up a whole continent. It is known for its vast Outback, the Great Barrier Reef, and its unique wildlife. The capital of Australia is Canberra.

Geography

Australia is one of the largest countries in the world, but it is also the smallest continent. Located south of Asia, Australia lies between the Indian Ocean and the Pacific Ocean. Off the southeastern coast is the island of Tasmania. It has more than 4,000 lakes. Along Australia's northeastern coast is the world's largest coral reef, the Great Barrier Reef.

The western half of the continent is a plateau with several deserts, including the Great Victoria Desert. East of the plateau is a lowland area that rises to the Great Dividing Range, a range of mountains on the east coast. In the southeast are the Australian Alps. There, Mount Kosciusko, Australia's tallest mountain, stands 7,310 feet (2,228 meters) high. The Darling and Murray rivers also run through the southeast.

Australia is very dry. Most areas have hot summers and mild winters. Because Australia is in the Southern Hemisphere, summer starts in December, and winter starts in June.

Uluru-Kata Tjuta National Park is located in Australia's Northern Territory. The area is sacred to Australian Aborigines.

Plants and Animals

Australia's plants vary from region to region. The rain forests of the northeast include flowering plants, palms, and laurels. Woodlands and forests cover eastern Australia. Eucalyptus trees are common in the highlands of the south and at the edges of the deserts. Desert shrubs and grasses grow in dry areas.

The country is home to many unique animals, including emus (large flightless birds), dingoes (wild dogs), and platypuses (egg-laying mammals). Many of the world's marsupials live in Australia—for example, kangaroos, koalas, and wallabies. Crocodiles, lizards, snakes, turtles, and parrots also live there.

People

More than 90 percent of Australians have European roots. Australia welcomed many immigrants, or people from other countries, over the years. However, entry tests were set up to make it very hard for nonwhites to settle there.

This changed in 1973. Since then, many Asians have immigrated to the continent. Aborigines, the native people of Australia, make up a small percentage of the population.

Almost 70 percent of Australians are Christians. There are also small groups of Buddhists and Muslims. Many people do not follow any religion.

Few people live in the central region, called the Outback or "bush." About 85 percent of all Australians live in cities, mostly along the coasts. The official language is English.

Economy

Australia is a prosperous country. Most people work in trade, businesses that serve the public, and manufacturing. Manufacturers make food, print, and metal products; chemicals; and machinery.

Australia's rich natural resources include oil, coal, and natural gas. Mines provide

A bridge crosses the Yarra River in Melbourne. The city is Australia's second largest, after Sydney.

iron, bauxite, copper, opals, and sapphires.

Agriculture and fishing are small parts of Australia's economy. Still, Australia is one of the world's largest producers of wool. The wool comes from more than 100 million Australian sheep. Farmers grow wheat, vegetables, fruits, nuts, cotton, and other crops.

History

Aborigines lived in Australia for at least 40,000 years before Europeans arrived. They came from Asia by boat or by land that is now underwater.

European Explorers

Portuguese and Spanish explorers may have landed in Australia in the 1500s. In the 1600s several Dutch explorers reached the continent. They included Dirck Hartog and Abel Tasman. Hartog discovered the west coast, and Tasman sailed along the southern tip of what is

now called Tasmania. Because of all these voyages the Dutch named the continent New Holland in 1644. But they did not settle there.

William Dampier, an English pirate turned explorer, landed on the west coast twice in the late 1600s. In 1770 Captain James Cook landed in south-eastern Australia and claimed it for Great Britain. He named the region New South Wales.

First Fleet and Settlement

Captain Cook thought that New South Wales was a good place for settlement. At the time, England's prisons were overcrowded. So the English government decided to send prisoners to Australia to start a penal colony—a place where criminals are sent to live.

Captain Arthur Phillip was in charge of the First Fleet. He led 11 ships carrying about 200 marines, a few free settlers,

more than 700 convicts, food stores, and farm animals. The trip took eight months and conditions were very hard. They reached Australia in January 1788 and settled in a bay that they named Sydney Cove. Phillip became the first governor of the colony.

Convicts and settlers worked to clear land and to establish farms. They were not used to the climate, which was different from England's, so the colonists struggled to survive. But soon more convicts and settlers arrived. The settlement grew bigger and stronger.

In the 1800s other parts of the country were settled. Some were also penal colonies. In 1851 the discovery of gold drew thousands of new immigrants to Australia. The settlements grew and became colonies separate from New South Wales. They became Tasmania, Western Australia, Victoria, Queensland, and South Australia.

The flood of settlers nearly wiped out the aboriginal population. Many Aborigines died while fighting for their land or from diseases brought by the Europeans.

Independence and War

By the late 1800s the six separate colonies each had an elected parliament, or group of lawmakers. In 1901 they became states when they joined together to form a federation. The new Commonwealth of Australia had a national parliament and six state parliaments. It kept ties with Britain, however, as part

of the British Commonwealth (a group of former British colonies).

When World War I began, Australians fought alongside the British Army. Many Australians died during the battle of Gallipoli in 1915. Australia also supported Britain when World War II began in 1939. In the 1940s the Japanese attacked several Australian cities. Their airplanes bombed Darwin, and submarines fired on Sydney. After the war Australia's population grew rapidly. Many immigrants came from war-torn Europe.

Recent Events

In the 1970s Australia started to focus less on Europe and more on its Asian neighbors. Many Asian immigrants arrived, and trade increased between Australia and Asian countries.

In the 1990s Aborigines won some rights to land. They also won more respect from white Australians. Many still face hardships, however.

The British monarch is still the head of state in Australia. Some Australians have called for change. They want the country to become a republic with a president as head of state. In 1999, however, Australians voted against a complete separation from Britain.

Austria

Most of Austria's mountains are part of a large mountain chain called the Alps.

Located in central Europe, Austria is a small, mountainous country. The capital of Austria is Vienna.

Geography

Austria is bordered by Switzerland, Liechtenstein, Germany, the Czech Republic, Slovakia, Hungary, Italy, and Slovenia. Some of the highest mountains of the Alps are in central and western Austria. Grossglockner, the highest peak, is 12,460 feet (3,798 meters) tall.

The major lowland areas lie in northern and eastern Austria. The northern lowland is the valley of the Danube River. Many other rivers, including the Enns, Inn, and Drava, flow through the valleys of the Alps. They form several passes through the mountains. Brenner Pass is the most important pass. It connects Austria with Italy.

Western Austria gets more rain and snow than eastern Austria. The east also has a greater range of temperatures. In some mountainous regions there is snow all year.

Plants and Animals

Austria is the most densely forested country in central Europe. Beech, birch, and oak trees grow in the warmer zones. Firs, larches, and pines grow in the hills and mountains.

Wild animals include brown bears, deer, hare, foxes, badgers, eagles, falcons, owls, cranes, swans, storks, and turkey vultures. In Austrian rivers live trout, grayling, pike, perch, and carp.

People

German is the official language of Austria. More than 90 percent of the people are Austrian. Small minority groups include Slavs, Turks, and Hungarians.

Most Austrians are Roman Catholic. About two thirds of Austrians live in cities and towns. Vienna is the largest city.

Economy

Services, or businesses that serve the public, and manufacturing are the most important parts of Austria's economy. Tourism and banking are major areas of the service industry. Tourists come for Austria's famous skiing resorts, cultural events, and scenic beauty. Manufacturers make machinery, food products, metals, and chemicals.

Austria's natural resources include lignite (brown coal), iron ore, petroleum (oil), natural gas, and magnesite (used to make magnesium). Austria is one of the world's leading producers of natural magnesite.

Austria uses less than half its land for farming and grazing. The major crops are sugar beets, corn, wheat, barley, potatoes, apples, grapes, and rye. Pigs, cattle, and chickens are the main livestock.

History

Romans, Germans, Slavs, Hungarians, and others have invaded Austria during its long history. A German family called the Hapsburgs ruled Austria and other parts of Europe from 1282 until 1918. In the 1800s the Hapsburgs joined with Hungary to form an empire called Austria-Hungary, which controlled much of central and eastern Europe. After the collapse of the empire in 1918,

A street in the Austrian city of Salzburg is lined with shops and cafés.

the country was reduced to one eighth of its original size.

German leader Adolf Hitler invaded Austria and made it a part of Nazi Germany in 1938. Austria was divided into four zones in 1945, after Germany's defeat in World War II. The United States, Great Britain, France, and the Soviet Union each occupied one of the zones. Austria's government had limited powers.

In 1955 Austria gained independence after its leaders promised to keep neutral, or stay out of foreign affairs. The country became stable, both politically and economically, in the 1970s. In the 1990s, however, some politicians began to blame immigrants for crime and economic problems. Others opposed these views.

Automobile

It is hard for anyone today to imagine what life was like before there were automobiles, or cars. Automobiles have made it easy for people to travel within a city or across a continent. They have also influenced where people live. People once had to live near their jobs, but now they can live farther away and drive to work.

Yet automobiles have brought problems as well. Tens of thousands of people are killed or injured each year in traffic accidents. Cities are often congested with huge traffic jams. And gasoline is a limited resource that pollutes the atmosphere when burned as fuel.

Parts of an Automobile

All automobiles have certain basic parts. The body of an automobile is the outer shell that encloses the vehicle's mechanical parts and its passengers. The body is attached to the chassis. This consists of a frame that holds all the other major

parts of the automobile together. Those other parts include the engine, a steering system, brakes, and the wheels.

How Automobiles Work

A driver operates a car by pressing on pedals to make it go and stop and by turning the steering wheel to guide where the car goes. The pedals and steering wheel work because they are part of a larger system.

Engine and Related Parts

Most automobiles are powered by internal-combustion engines. In such an engine a mixture of air and gasoline enters a tubelike cylinder through valves. There the mixture makes small explosions. Each explosion produces gases that expand rapidly and push against a device called a piston on one end of the cylinder. The piston goes up and down as the gases expand and contract. Rods connected to the pistons convert that movement into the power that eventually turns the wheels. Most automobile engines have four to eight cylinders.

Many parts work together to make an automobile run.

The air-fuel mixture that enters the engine cannot ignite by itself. It needs an electric spark. This comes from devices called spark plugs. They get their electric current from a battery. The battery also powers the automobile's lights, horn, turn signals, windshield wipers, starter, and instruments such as the gasoline gauge.

An exhaust system carries burned gases from the engine to the muffler. The muffler cools the gases. It also reduces their pressure. This reduces the noise coming from the tailpipe. Modern cars are also equipped with a device called a catalytic converter. The catalytic converter uses chemicals to reduce exhaust pollution.

Power Train

The engine provides power to make a car go, but something else must turn the wheels. The parts of the car that transmit, or deliver, power from the engine to the wheels are together called the power train. When a car is starting or moving uphill the engine must deliver more power than when it is cruising on level ground. The transmission uses gears to reduce or increase the speed and power of the engine. The drive shaft carries the power from the transmission to the axle, which connects the wheels.

Other Mechanical Parts

Once a car is moving it is important to be able to make it stop. When a driver presses the brake pedal, pistons force fluid through small, flexible pipes to brakes at each wheel that stop the vehicle.

The wheels of an automobile are part of a system called the suspension system. This consists of springs that absorb bumps and shock absorbers that cushion the spring movement. The air-filled tires of an automobile also cushion the ride.

History

The first true automobile was a machine that had three wheels and was powered by steam. It was built by Nicolas-Joseph Cugnot of France in 1769. It was heavy and moved very slowly. Many manufacturers produced steam-driven automobiles during the late 1890s and early 1900s. A disadvantage of steam was that water had to be brought to a boil before the car could go.

During this same period other manufacturers produced cars run by electric motors. Electric cars ran smoothly and were easy to operate. However, they did not run well at high speeds. They also had to have their batteries recharged every 50 miles (80 kilometers) or so.

Two men ride an early automobile in about 1901. The first cars looked very different than the cars of today.

Did You Know?

British and American people use different words for certain parts of cars. For example, the part called the hood in the United States is the bonnet in Great Britain.

Gas Engines

Étienne Lenoir of France developed a gasoline-powered internal-combustion engine in 1860. In 1876 the German Nikolaus Otto built an improved gasoline engine. Gasoline engines proved to be more reliable than the other kinds. The brothers Charles E. and J. Frank Duryea built the first successful gasoline-powered car in the United States in 1893. Soon several people set up factories to produce cars.

Development of the Automobile Industry

Henry Ford made his first automobile in Detroit in 1896. Ford introduced the assembly line in 1913. This made it easy to produce many cars very quickly. Assembly-line workers stay in one place and do only a single task as the parts pass by on a conveyor. Ford soon sold millions of cars. Several other companies were established at this time as well.

Innovations

In the period after World War I (1914–18), automobiles became easier to operate and more comfortable. Steel bodies and heaters became common.

After World War II (1939–45) automakers began using power steering, power brakes, and automatic controls for windows and seats. Air conditioning also became available.

In the late 1950s, European compact cars like the Volkswagen Beetle caused a sensation. U.S. makers built their own compact cars starting in 1959.

The Problem of Oil

The gasoline used in automobiles comes from petroleum (oil). As the United States began to use up its own oil supplies, it looked to other countries for more. In 1973 the oil-producing countries stopped shipping as much oil to the countries that needed it. This caused high prices and long lines at gas stations. It also made automakers work to produce cars that did not use as much gasoline. Japanese companies were especially successful at this.

Automobiles also cause air pollution. As gasoline is burned it produces harmful gases. Some scientists blame these gases for a problem called global warming. By the 21st century some automakers had created vehicles that combined gasoline and electric power.

Safety

Early cars were very dangerous to ride in. Since then automobile manufacturers have worked to create safer cars. They installed such devices as seatbelts and air

Hybrid cars use less gasoline than other cars. They rely on an electric motor for part of their power.

bags to protect riders in a crash. They have also tried to improve the way cars are built so that the cars will survive a crash better.

Avalanche

An avalanche is a large amount of snow that quickly moves down a slope. An avalanche can be deadly because it will bury or sweep away anything in its path. Large amounts of sliding earth or other materials may also be called avalanches. But these are often known as landslides.

Many different conditions make an avalanche possible. An avalanche is more likely to happen on a slope without trees or large rocks. These things help to keep snow in place. A weak layer of snow also makes an avalanche likely. For example, melting and refreezing may cause a layer of snow to become slick. Snow piling on top of this weak layer can easily slide off.

Heavy snowfall, strong wind, and rising temperature all can start an avalanche. Falling rocks or ice also can cause snow to slide. Even the movement of a skier or a snowmobile can begin an avalanche.

Avocado

Although many people think that avocados are vegetables, they are actually

The avocado is a fruit with a large seed inside.

fruits. An avocado is a berry with one large seed, or pit, in the center.

There are more than 1,000 varieties of avocado. Avocado trees grow wild in Mexico and in Central and South America. American Indians in those areas developed some avocado varieties thousands of years ago. Today farmers grow avocados in many places with mild winters and plenty of sun.

Avocado trees have broad, shiny leaves that stay green all year. The trees can grow up to about 65 feet (20 meters) tall. Their fruits are round or pear-shaped. They vary widely in size. On the outside the fruits are green or dark purple. The greenish or yellowish flesh inside turns soft after picking.

Avocados are rich in fat, protein, and several vitamins. They can be eaten raw. Mashed avocado is the main ingredient in the Mexican sauce called guacamole.

Axum

► see Aksum.

Did You Know?

People in mountainous areas protect themselves from avalanches in several ways. Special fences hold snow in place. Barriers also help to stop sliding snow.

Azerbaijan

The country of Azerbaijan sits at the crossroads between central Asia, Europe, and the Middle East. The capital is Baku.

Azerbaijan is bordered by Russia, Georgia, Armenia, and Iran. The Caspian Sea lies to the east. A part of Armenia separates the Azerbaijani republic of Nakhichevan from the rest of Azerbaijan.

The Caucasus Mountains run through northern and southern Azerbaijan. The central area is a large plain crossed by the Kura River. Most of Azerbaijan is dry, with hot summers and mild winters. The region has many earthquakes.

Most of the country's people are Azerbaijani, though there are a few Russians, Armenians, and other minority groups. Most people speak Azerbaijani, a Turkic language. More than 90 percent are Muslims. However, the people of the

Nagorno-Karabakh region (an area also claimed by Armenia) are mostly Eastern Orthodox Christians. About half of the people live in cities.

Azerbaijan's economy is based on its natural resources and agriculture. Its major resources are petroleum (oil) and natural gas. Crops include grains, vegetables, fruit, sugar beets, cotton, tobacco, and tea. Sheep, goats, and cattle provide wool and meat. Manufacturers make mainly food and petroleum products.

Azerbaijan's written history is more than 2,000 years old. At various times Arabs, Persians, Turks, and Mongols dominated the land. Russia took over Azerbaijan in the early 1800s. In 1918 Azerbaijan declared its independence. In 1920, however, the new Soviet Union invaded Azerbaijan. At first the Soviets combined Azerbaijan with Georgia and Armenia. In 1936 Azerbaijan became a separate Soviet republic. With the breakup of the Soviet Union, Azerbaijan gained independence again in 1991.

In the late 20th and early 21st centuries Azerbaijan fought with Armenia over control of the Nagorno-Karabakh region. Armenia seized control of some Azerbaijani land.

Aztec

In the 1400s and early 1500s the Aztec people controlled a large empire in the area that is now central and southern Mexico. At its most powerful, the Aztec Empire spread over 80,000 square miles (207,000 square kilometers). Montezuma II, the last great Aztec emperor, ruled over 5 to 6 million people.

How the Aztec Lived

The capital city of the Aztec was Tenochtitlán. It was built on land that today is part of Mexico City. Tenochtitlán reflected the power and wealth of the empire. It had gleaming white palaces and temples on top of pyramids. City officials lived in houses made from stone and adobe, or sun-dried clay. Farmers lived in huts made of woven rods and twigs covered with clay.

Most Aztec were farmers. They grew corn, beans, peppers, squash, tomatoes, tobacco, and cotton. Other Aztec were traders and craftsmen.

The Aztec spoke a language called Nahuatl. They had no alphabet of their

own, but they used picture writing to record their history.

Religion was very important to the Aztec. They worshipped several gods who represented the forces of nature, such as rain or sun. The god of war was important, too.

The Aztec often used human sacrifice to get help from the gods. This practice involved killing a person to honor a god. The Aztec believed that because life was humankind's most precious possession, it was the best gift for the gods. They sacrificed thousands of prisoners captured in war.

History

The Aztec probably moved into central Mexico from the north in about AD 1200. There they took on parts of the cultures of earlier peoples, including the Toltec, the Maya, and the Zapotec. They founded Tenochtitlán in about 1325. They conquered neighboring peoples to build up their empire.

The Aztec were at the height of their power when Hernán Cortés and his Spanish soldiers arrived in 1519. The Spanish put the emperor Montezuma II in prison, where he died. In 1521 the Spanish took control of Tenochtitlán, ending the Aztec Empire. Many of the Indians living in the Mexico City region today are descendants of the Aztec.

An Aztec drawing shows Aztec and Spanish soldiers just before a battle. The Spanish are in a building.

Bach, Johann Sebastian

German musician Johann Sebastian Bach is considered one of the world's greatest composers of music. He was also a gifted player of the organ and the harpsichord (another keyboard instrument).

Bach created hundreds of musical compositions, including works for choir, orchestra, and individual instruments, especially the organ. Among his many masterpieces are the six *Brandenburg* concertos, which have parts for both an orchestra and solo instruments. Bach composed many works for Lutheran church services. He also wrote longer sacred pieces, such as the *Mass in B Minor* (1749), for choir, soloists, and orchestra.

A painting from 1720 shows Johann Sebastian Bach.

Early Life

Bach was born on March 21, 1685, in Eisenach (now in central Germany). His eldest brother, who was an organist, probably gave him his first keyboard lessons. Bach attended school in Lüneburg, where he sang in a boys' choir. By the time he left, he was a skilled organist and composer.

Career

Bach worked as a musician and composer in churches and in the service of German noblemen in various cities. His first major position was as the official organist for a duke at Weimar. Later he also became director of the duke's orchestra. His duties included composing a sacred cantata—a type of music for use during church services—every month.

In 1723 Bach became the director of church music for the city of Leipzig. During his early years in this job, he composed many cantatas, sometimes up to one per week. At Leipzig he also directed an orchestra off and on from 1729 into the early 1740s. Bach died in Leipzig on July 28, 1750.

During his lifetime Bach was known mainly for his skill as a musician. After his death his compositions were mostly forgotten until the early 1800s. Then people began to rediscover his works. Today the music of Bach is highly acclaimed and is performed frequently.

Bacteria

Bacteria are small organisms, or living things, that can be found in all natural environments. They are made of a single cell. Most bacteria can be seen only with a microscope.

Bacteria do not have most of the structures found in the cells of other organisms. They are much simpler and smaller than all other cells of living things.

Bacteria take in food and send out waste through their cell walls. Most bacteria reproduce by dividing down the middle to form two separate cells. These each divide again to form a total of four cells. Through this process, billions of bacteria may form from a single bacterium in only 24 hours.

Bacteria that cause diseases can get into the human body through the nose, the

mouth, and cuts in the skin. Once inside, these bacteria quickly reproduce and cause illness, called an infection. The infection may result from the bacteria themselves or from their poisonous waste products, called toxins. Luckily, the immune system of the human body can fight these threats.

Sometimes the immune system needs help in fighting off bacteria. Doctors may inject dead or weakened bacteria into the human body. This is called a vaccine. A vaccine prepares the body to fight off the same bacteria in the future. Doctors may also use medicines called antibiotics to kill bacteria in the body.

Badger

Badgers are mammals known for their powerful digging. They are related to weasels, skunks, otters, and mink.

Badgers live in many habitats, including grasslands and forests. There are eight species, or types, of badger. The American badger lives in the western part of North America. The Eurasian badger can be found in Europe and Asia. The other types live in Southeast Asia. They include hog badgers, ferret badgers, and stink badgers.

Badgers are heavily built animals with short legs. The different species range from 13 to 32 inches (33 to 81 centimeters) long, not including the tail. They

Did You Know?

Most bacteria are so small that they can be seen only by using a microscope. This bacteria sample has been magnified 2,000 times.

are about 9 to 12 inches (23 to 30 centimeters) high. The American badger sometimes looks wider than it is high. Most badgers have gray or brown fur. Many types have black-and-white marks on the face and back.

Badgers have strong front feet with heavy claws that are excellent for digging. Badgers dig to make underground homes called burrows. They may also dig to find small animals such as squirrels, mice, and rabbits to eat. Many kinds eat insects, lizards, birds, and plants, too. Badgers feed mainly at night.

The American badger is usually found in open, dry areas of western North America. Like other badgers it has large front claws that it uses for digging.

Badgers are strong for their size. They can fight fiercely when threatened. All badgers have scent glands near the tail. Like skunks, stink badgers shoot a foul-smelling liquid from these glands at their enemies.

Baghdad

Population
(2007
estimate), urban
area,
5,054,000

Baghdad is the capital of the Middle Eastern country of Iraq. It is also Iraq's largest city. Baghdad lies on both banks of the Tigris River.

Most of Iraq's industries are located in and around Baghdad. At one time the city produced a wide variety of goods, including cloth, furniture, chemicals, and electrical equipment. The economy of the city was disrupted by wars in the late 20th and early 21st centuries.

People have lived on the site of Baghdad for some 4,000 years. In AD 762 an Arab Muslim ruler moved the capital of his large empire there. Baghdad reached its greatest power in the late 700s and early 800s. It also became a center of learning.

In 1258 the Mongols captured Baghdad. Later several other foreign powers invaded the city.

In 1921 Iraq became an independent country with Baghdad as its capital. The city began to grow again in size and importance.

Iraq's long war with Iran in the 1980s hurt Baghdad's development. During

the Persian Gulf War of 1991, the United States and its allies dropped bombs on the city. Baghdad suffered further damage when forces led by the United States invaded the city in 2003.

Baha'i Faith

All Baha'i houses of worship have nine sides and a dome. The House of Worship in Wilmette, Illinois, is the only one in the United States.

In the middle of the 1800s a religion called the Baha'i faith started in what is now Iran. It later spread around the world. Its followers, called Baha'is, seek to bring together all people in one religion.

Beliefs and Practices

Baha'is believe that all religions are one and all people are one. They also believe

that God is beyond understanding. They teach that people should worship God and try to make the world a better place.

At services, members listen to readings from the scriptures of all religions. Baha'is have no priests or special ceremonies. There are rules about prayer and fasting, however. Also, a person is supposed to marry only once and should not use alcohol or tobacco.

History

A man named Mirza 'Ali Mohammad started a group called the Babi in Persia (now Iran) in 1844. He believed that a new prophet, or messenger of God, would soon appear. Muslim leaders and the government opposed his ideas. He was arrested, and in 1850 he was killed.

One of the first Babis was Mirza Hoseyn 'Ali Nuri. After he joined the group, he called himself Baha' Ullah. He was arrested in 1852. While in jail, he realized that he was the new prophet. In 1853 he was released and sent to Iraq. He led the Babi community there. The Babis who believed that he was the new prophet were called the Baha'is.

Baha' Ullah died in 1892. After his death, his oldest son led the group. He helped spread the faith to North America, Europe, and other continents. By the end of the 1900s, it had about 7 million followers around the world.

Did You Know?

The Baha'i calendar has 19 months of 19 days each because the religion started with 19 followers.

Bahamas, The

Located just southeast of Florida, the country of The Bahamas is a chain of islands in the Atlantic Ocean. The capital is Nassau on New Providence Island.

The Bahamas includes about 700 islands, but people live on only about 30 of them. The islands are low and flat. There are no rivers. The climate is tropical, with warm weather year-round. From July to November, hurricanes may occur.

Forests of pine, broadleaf, and palm trees grow on some islands. Animals of The Bahamas include frogs, lizards, and snakes. The surrounding waters are filled with fish, conchs, crayfish, and other marine animals.

Most people in The Bahamas trace their roots to slaves from West Africa. Smaller groups include mulattos (people with both black and white ancestors), British and U.S. whites, and Haitians.

The economy of The Bahamas depends on tourism. Tourists come to enjoy the beaches and crystal blue waters. Banking is another important industry. Crayfish, poultry, and fruit are the main agricultural products. Bahamians also mine limestone, harvest salt from the sea, and make rum.

The peaceful Arawak people lived on the islands before Europeans arrived. Christopher Columbus landed in The Bahamas in 1492 and claimed the islands for Spain. Within 30 years the Arawak had completely disappeared from The Bahamas.

Many tourists arrive in The Bahamas on cruise ships.

British settlers arrived on Eleuthera Island in 1648. Except for brief control by both the United States and Spain in the late 1700s, The Bahamas stayed British until 1973. That year the islands gained independence.

Bahrain

Bahrain is a small country in the Persian Gulf. It is made up of one main island, called Bahrain Island, and about 30 smaller islands off the coast of Saudi Arabia. The capital is Manama.

Fruit trees grow on the northwestern coast of Bahrain Island. Desert plants grow in the dry areas. Animals include gazelles, hares, lizards, jerboas (desert rats), and mongooses.

The majority of the country's people are Arabs. There are also groups of South Asians and Persians. Arabic is the official language, and Islam is the official religion. Most of the people live in cities.

Bahrain is a center for more than 60 foreign banks. Its major industries depend on its reserves of petroleum (oil) and natural gas. Bahrain also manufactures aluminum products and clothing. Tourism is a growing industry. Agriculture

The desert sun shines down on a mosque in the city of Madinah 'Isa, Bahrain.

tural goods include dates, other fruits, vegetables, eggs, and milk.

Bahrain was likely the site of ancient Dilmun, a trading center in about 2000 BC. Arab Muslims have lived in Bahrain since the AD 600s. Portugal ruled from 1521 to 1602, followed by the Persians. In 1783 the Khalifah family drove out the Persians. A sheikh, or chief, of that family has ruled Bahrain ever since.

Great Britain took control of Bahrain's foreign affairs in the 1800s. Bahrain declared itself independent in 1971. Disagreements between two Muslim groups soon caused problems. About half of Muslims are Shi'ites, but Sunnites hold most of the political and economic power.

Balboa, Vasco Núñez de

The Spanish conquistador (conqueror) Vasco Núñez de Balboa was the first European to see the Pacific Ocean. He also helped to found the first successful

Vasco Núñez de Balboa

European colony on the mainland of the Americas.

Balboa was born in Spain in 1475. He left for America in 1500 and settled on the island of Hispaniola, in the West Indies. In 1510 he sailed with a group headed for a colony in what is now Colombia. When they arrived they discovered that the colony had been abandoned except for a few people. Balboa persuaded them to go with him to Darién, in what is now Panama. There they established a stable colony.

Indians told Balboa about a great ocean with gold on its shores. Balboa asked for a large expedition from Spain to search for this ocean, but before it arrived he set out on his own with a smaller group. In September 1513 he reached the Pacific, which he called the South Sea, and claimed it for Spain.

The expedition from Spain arrived in 1514, with Pedro Arias Dávila at its head. Balboa and Dávila competed for power. As governor of Darién, Dávila eventually charged Balboa with various crimes. Balboa was found guilty and beheaded in January 1519.

Balkan Peninsula

The Balkan Peninsula is a large piece of land in southeastern Europe. It is divided into many countries, including Slovenia, Croatia, Bosnia and Herzegovina, Serbia, Montenegro, Macedonia,

Moldova, Romania, Bulgaria, Albania, Kosovo, Greece, and the European part of Turkey. Sometimes the region is called the Balkans. The history of the Balkans includes many invasions and wars.

Geography

Mountains cover most of the peninsula. The name Balkan means “mountain” in the Turkish language. The only large lowland regions are plains in Romania and Bulgaria. The Danube River is the most important waterway of the Balkans. The northern part of the peninsula has cold, snowy winters and warm summers. The south has mild winters and hot, dry summers.

People

Many different peoples live in the Balkans. Most of the peoples belong to a larger group called Slavs. The main Slavic peoples include Serbs, Croats, Slovenes, and Macedonians. The other peoples of the Balkans include Romanians, Albanians, Bulgarians, Hungarians, Turks, Germans, and Roma (Gypsies). Each group has its own lan-

guage. Christianity and Islam are the main religions. Religion has been a source of conflict in the Balkans.

History

Peoples called Illyrians, Thracians, and Dacians lived in the Balkans in ancient times. In 229 BC the Romans invaded the peninsula. They controlled the Balkans for many centuries. Christianity spread through the Roman Empire in the 300s AD. In 395 the empire divided in two. The dividing line ran through the Balkans. The western part of the empire was ruled from the city of Rome. The peoples who lived there became Roman Catholics. The east was ruled from the city of Constantinople (now Istanbul, Turkey). The peoples who lived there became Eastern Orthodox Christians. At about the same time different peoples began invading the Balkans from the north. The Slavs were among them. By the 500s the Slavs had spread over much of the peninsula.

The Slavs then started to separate into different peoples. Religion was a major force in those separations. The Slavs who lived in the western part of the Balkans mostly became Roman Catholics. Those who lived in the east mostly became Eastern Orthodox Christians.

Some Balkan peoples created their own kingdoms. The Bulgarians and the Serbs built up empires. But in the late 1300s and 1400s the Ottoman Turks conquered the Balkans. They made the whole region part of the Ottoman Empire. The Turks converted some Slavs and other peoples to Islam.

During the 1800s Balkan peoples formed states that rebelled against the Turks. In 1912 the states of Serbia, Bulgaria, Greece, and Montenegro joined together to defeat the Turks in war. Soon, though, the Balkan states began fighting each other. They disagreed over who should control the land that had been won from the Turks. During World War I (1914–18) the Balkan states were split between the two sides.

After World War I a new Balkan country was created. It combined the Slavic lands of Serbia, Montenegro, Croatia, Slovenia, Bosnia and Herzegovina, and Macedonia. Each became a republic of the new country. In 1929 the country was named Yugoslavia.

For many years after World War II most of the Balkan countries were ruled by strict Communist governments. In 1989 the Communists began to lose power. The Balkan countries then made their governments more democratic.

In 1991 and 1992 Croatia, Slovenia, Macedonia, and Bosnia and Herzegovina broke away from Yugoslavia to form separate countries. That led to fighting that lasted for several years. The two republics that stayed in Yugoslavia were Serbia and Montenegro. In 2003 they dropped the name Yugoslavia. Then, in 2006, Serbia and Montenegro split into separate countries. In 2008 another split occurred. The province of Kosovo declared itself independent from Serbia. Serbia refused to recognize Kosovo as an independent country, however.

Did You Know?

When people say that a region or group is balkanized, they mean that it has been split up into many small units.

Ballet

Ballet is a dance form that began in the 1500s. It is a theatrical art, meaning that it is performed to music and with costumes and scenery.

Positions and Steps

Ballet is based on a formal system of poses and steps that have been changed only slightly through the years. There are five basic positions of the feet. In all of them the legs are “turned out,” or rotated from the hips so the feet point outward. The foot positions in ballet are balanced by matching positions of the arms. In addition to the position of the feet and arms, there are two major body positions. In an arabesque one leg supports the body’s weight while the other leg extends backward with the knee

A church stands on an island in the middle of Lake Bled in Slovenia.

Ballet dancers use five basic positions of the feet and arms in all of their dancing.

straight and the foot pointed. In a similar position called an attitude, the knee of the raised leg is bent.

Among the basic steps of ballet are various jumps, turns, and quick gliding or sliding steps. Female dancers, called ballerinas, dance part of the time on the tips of the toes. This often gives their movements a floating quality.

History

Ballet developed from dances performed in the late 1500s for and by members of the French royal court, including the king. These court ballets used many steps of the social dances of the time. In 1661 the French king Louis XIV established the Royal Academy of Dance for the study of ballet. Soon only trained professionals danced in ballets. The academy's first director created the five basic ballet positions. Over the next several decades, its dancers developed many of ballet's basic steps.

Many early ballets combined dancing with opera or scenes from a play. The dramatic ballet, which tells a story through dance, was developed in the 1700s. Choreographers (who create a

dance's steps and movements) and dancers of the time also began to use new, more expressive steps and gestures.

In the mid-1800s French dancer and choreographer Marius Petipa moved to Russia and established Saint Petersburg as the major center for ballet. Petipa and composer Peter Ilich Tchaikovsky created several famous ballets, including *Swan Lake*, *Sleeping Beauty*, and *The Nutcracker*.

In the early 1900s Sergey Diaghilev founded a company called the Ballets Russes. Among his associates were famous composers and artists and such great choreographers and dancers as

Dancers perform the ballet *Swan Lake*.

Michel Fokine, Léonide Massine, Vaslav Nijinsky, Anna Pavlova, and George Balanchine. The Ballets Russes toured widely and greatly influenced dancers in the West. Many of its artists later moved to the United States.

Balanchine founded what became the New York City Ballet in the 1940s. He choreographed more than 150 works for the company, several featuring music by Igor Stravinsky. The company that became the American Ballet Theatre began performing in 1940. It is also based in New York City.

Other great companies, such as the Royal Ballet of England and the Royal Danish Ballet, also flourished in the 1900s and beyond. In Russia the Bolshoi Ballet in Moscow and the Kirov Ballet in Saint Petersburg continued to uphold the highest standards.

Balloon

Like airships, balloons are lighter-than-air craft. They are filled with a gas or heated air that makes them float in the air. Early experiments with balloon flight led to the development of the motor-powered airship and later the airplane.

Types of Balloons

Balloons come in all shapes and sizes, from small toy balloons to large passenger balloons. They can be used for advertising purposes, for scientific

Balloons are popular features of many parades.

experiments, for entertainment, or for recreation. Giant balloons of cartoon characters and other entertaining subjects are familiar sights in parades. These are controlled by people on the ground, who carry them along the parade route. Scientific balloons and those used for recreation are free to move through the air as they are guided by a pilot.

How Balloons Fly

A balloon rises because it is filled with a gas that is lighter than air. The lightest gas is hydrogen. Hydrogen, however, catches fire and explodes easily. Helium is almost as light as hydrogen, and it does not burn. Helium is used for balloons that are held down with ropes, such as the ones seen in parades. Some free passenger balloons are also filled with helium or with hydrogen. Others are filled with heated air, which is lighter than unheated air. For long-distance

balloon flights a combination of helium and hot air is used.

A free passenger balloon has a huge gas bag, or envelope. It is filled through an opening at the bottom, called the neck or appendix. In a hot-air balloon, a propane burner at the neck keeps the air inside the bag hot. The entire bag is enclosed in a strong net. A basket is attached to the net and hangs underneath the bag. This holds the passengers. At the top of the bag is a valve for releasing gas. This valve is connected to a cord that usually runs through the bag and out the neck. It hangs within reach of the person operating the balloon. Bags of sand are hung around the basket for ballast, or extra weight, so that the balloon does not rise too fast.

The balloon rises gently after the cables holding it on the ground are unhooked. The movement of the balloon is largely

Colorful hot-air balloons soar above Albuquerque, New Mexico.

controlled by the wind. The main control the balloonist has is to move the balloon up and down. As ballast is thrown overboard, the balloon rises. As gas is released through the valve, the balloon drops.

History

Joseph-Michel and Jacques-Étienne Montgolfier were two brothers who lived in France. They made the first successful experiments with hot-air balloon flights in 1783. The first balloon passengers were a sheep, a rooster, and a duck, but soon afterward two men sailed for 5.5 miles (9 kilometers) over Paris.

Soon others began experimenting with balloons. Some people focused on the sport of trying to make longer and longer flights. Others saw balloons as useful tools, especially during wartime. During the American Civil War and World War I, armies used balloons to spy on their enemies. Today scientists send tools up in balloons to gather information about the weather and the upper atmosphere.

Free balloons are still used for sport and adventure. In 1999 Bertrand Piccard and Brian Jones became the first balloonists to complete a nonstop voyage around the world. Three years later U.S. adventurer Steve Fossett became the first person to complete the trip alone. In Albuquerque, New Mexico, and other locations there are annual hot-air balloon festivals featuring hundreds of colorful balloons.

Baltic Sea

An arm of the Atlantic Ocean, the Baltic is a shallow sea in northern Europe. For a sea, the Baltic does not have very salty water. Several rivers, including the Oder and the Vistula, drain into the sea. The huge flow of fresh river water keeps the Baltic from getting too salty.

The Baltic Sea lies between the Scandinavian peninsula and the rest of Europe. It covers an area of about 149,000 square miles (386,000 square kilometers). The countries that border the Baltic are Sweden, Denmark, Russia, Finland, Estonia, Latvia, Lithuania, Ger-

many, and Poland. The coasts of Sweden and Finland are generally rocky, but the coasts on the southern Baltic are flat. The Baltic coastline of Germany has a lot of bays and shallow inlets called fjords. Canals link the Baltic to the North Sea and the Arctic Ocean.

The countries around the Baltic use the sea for trade. The chief ports are Copenhagen, Denmark; Stockholm, Sweden; Helsinki, Finland; Saint Petersburg, Russia; and Gdansk, Poland.

The Vikings were the first to trade on the Baltic, in the AD 700s. During the Middle Ages, German merchants of a group called the Hanseatic League controlled trade on the sea. As the countries around the sea prospered, the area became more developed. By the middle of the 1900s pollution from industries and farms was a concern. In the 1990s the Baltic countries agreed to clean up the environment in and around the sea.

Bamboo

Bamboo is a name used for many types of tall, treelike grasses. There are hundreds of different species, or types, of bamboo in the world. They grow in mild to warm and humid areas. Most are in Asia and on islands of the Indian

Many types of bamboo look like trees, but they are actually tall grasses.

and Pacific oceans. A few types grow naturally in the southern United States.

The stems of bamboo are called culms. They vary greatly in size. The smallest types are 4 to 6 inches (10 to 15 centimeters) tall. In the largest species the culms can be more than 130 feet (40 meters) tall. Culms are hollow and grow in clusters from an underground stem called a rhizome. Some grow as much as 1 foot (0.3 meter) per day.

Bamboo is used for a variety of purposes, especially in Asia. In some countries, the seeds are eaten as grain, or the young shoots are cooked and eaten as vegetables. Cattle eat the leaves. Some types of bamboo are crushed to make paper. The stems of other types are tied together and used as rafts. They are also used to form scaffolding, or a framework on building construction sites. Bamboo stems are also used to make buckets, pipes, furniture, walking sticks, fishing poles, garden stakes, chopsticks, and other utensils.

Banana

Bananas are one of the most important and popular foods in the world. They are a flavorful fruit that is full of vitamins. They can be found in stores throughout the year.

Where Bananas Grow

Scientists believe that bananas first grew in the tropics in Asia. Over the years they spread to other humid tropical places. Today people grow bananas in

Bananas grow in clusters on a banana plant.

Africa, Asia, Central America, and South America.

Physical Features and Growth

Bananas grow on a banana plant. Although it is often called a tree, the banana plant is really a large herb. That means it does not have a woody trunk like a tree. Instead the banana plant has a stalk that looks like a tree trunk. The stalk grows from an underground stem.

The banana plant can be more than 20 feet (6 meters) tall. Large leaves grow near the top. These leaves are 9 to 12 feet (3 to 3.5 meters) long. Each plant produces 50 to 150 bananas. The bananas grow in clusters of 10 to 20. The bananas are usually chopped down while green and unripe.

A banana plant only produces one bunch of fruit. After the bananas have been picked, the plant is cut down. In

six months new shoots grow from the underground stem.

There are hundreds of types of banana. One of the most popular is the common banana. Its fruit is yellow and sweet when ripe.

Uses

Bananas contain the mineral called potassium. They are also a good source of vitamins A and C. Bananas are usually eaten fresh. However, they can be used in pies, muffins, cakes, or breads. The plantain is a close relative of the common banana. It is always cooked before being eaten.

Bangkok

Population
(2007 estimate)
6,704,000

Bangkok is the capital of Thailand, a country of Southeast Asia. It is Thailand's largest city by far. Bangkok is a center for government, education, cul-

ture, and business. It is also Thailand's main port. The city lies on both banks of the Chao Phraya River.

More than 300 groups of Buddhist temple buildings, called *wats*, are found throughout Bangkok. They are centers of the city's religious and cultural life.

Factories in Bangkok process foods and make cloth, building materials, and electronics. Rice, tapioca, rubber, sugarcane, and other products are shipped from the city's port. Tourism is also important to the economy.

Merchants sell fruits, vegetables, and other items from boats at a floating market in Bangkok.

In 1782 Bangkok became the capital of the kingdom of Siam, which is now Thailand. Railways, electricity, and other improvements made the city more modern in the 1800s and early 1900s. Bangkok began to grow rapidly in the second half of the 1900s.

Thailand

Bangladesh

Bangladesh is a country in south-central Asia. It is one of the most crowded countries in the world. Although 92 countries are larger than Bangladesh, only seven have more people. Dhaka is the capital.

Geography

Bangladesh is surrounded by India and Myanmar. The Bay of Bengal lies to the south. The country's many rivers include the Ganges (known as the Padma in Bangladesh), the Brahmaputra (known as the Jamuna in Bangladesh), the Tista, the Meghna, the Surma, the Karnaphuli, the Sangu, and the Matamuhari.

Bangladesh has a tropical monsoon climate. This means that it has heavy rains and high temperatures during the summer. Damaging floods occur every two or three summers. In 1991 a cyclone killed more than 100,000 people. The winters, however, are dry and cool.

Plants and Animals

Forests cover about one sixth of Bangladesh. Plant life includes groves of mango, jackfruit, bamboo, betel nut, coconut, and date palm trees. The country's animals include elephants, royal Bengal tigers, langur monkeys, leopards, and black bears. About 750 types of bird nest in Bangladesh, and snakes are also common.

People

Almost 98 percent of the people are Bengalis. They speak Bengali, the state language. West Bengal, a neighboring state of India, shares the Bengali culture.

Islam is the main religion in Bangladesh. Followers of Islam, called Muslims, make up about 86 percent of the population. About 12 percent of the people are Hindus. The rest are mostly Buddhists and Christians.

Economy

Bangladesh is a poor country. Most of the people live in rural areas and make their living by farming. The main crops are rice, sugarcane, potatoes, wheat, jute, bananas, sweet potatoes, oilseeds, mangoes, and tea. Goats and cattle are the main livestock.

Bangladesh is one of the world's largest producers of jute fibers. These fibers are

used to make fabric and twine. Manufacturers also make clothing, shoes, tobacco and food products, chemicals, and iron and steel.

History

Bangladesh is part of a historic region called Bengal. From the 700s to the 1100s Buddhist and Hindu kings ruled Bengal. Muslims invaded in about 1200. The region remained largely independent until the 1600s. Then the Mughal Empire, which controlled India at the time, made Bengal one of its provinces. The British took control of all of India in the 1700s. They ruled the area as a colony until 1947.

After the British left, the colony of India was divided into two independent countries: India and Pakistan. India lay between Pakistan's two provinces—East

Pakistan (now Bangladesh) and West Pakistan (now Pakistan). The people of East and West Pakistan spoke different languages and had different cultures. The provinces struggled for power. War broke out in 1971. About 1 million Bengalis were killed, and millions more fled to India. India helped East Pakistan defeat West Pakistan. Then East Pakistan became the independent country of Bangladesh.

Bangladesh held its first national election in 1973, but the military soon took over the government. Beginning in 1991 Bangladesh held a series of free elections. However, the elections often led to protests and violence over the results.

Bank and Banking

Young people can open a savings account at a bank with the help of a parent or another relative.

A bank is a business that borrows and lends money. It borrows money from customers called depositors. It lends money to other customers called borrowers. It pays fees to the depositors and collects fees from the borrowers. The fees are called interest. The bank makes a profit by collecting more interest than it pays out. Modern banks do many other things for their customers as well.

Bank Accounts

A person who has money deposited in a bank is said to have a bank account. One kind of bank account is called a checking account. A person with a checking account can write checks to pay for things. A check is an instruction to the bank to pay out money from that person's account. People can also use a plastic card, called a debit or check card, to pay out money from their checking accounts. Checking accounts pay little or no interest to the depositor. People use them because they are a safe and convenient way to handle money.

Another kind of bank account is a savings account. People keep money in savings accounts in order to earn interest. The bank pays a certain amount of interest for every dollar that someone has in their savings account.

A bank keeps only part of the money in its accounts as cash. It uses the rest to lend to other people and to make investments. It keeps track of all this money in computers.

Lending and Other Services

People and businesses often borrow money from banks. The money they borrow is called a loan. They pay the loan back with interest. They usually pay in monthly portions called installments. If the borrower does not repay, the bank may take away the thing—a car, for example—that the loan paid for.

Modern banks provide other services as well. Some banks sell insurance, provide help with taxes, and handle investments

Some aid agencies operate small banks and credit unions to help people in developing areas. They loan money to people to start small businesses.

in stocks and bonds. Many banks issue credit cards and send monthly bills to the people who use them. Banks also maintain automated teller machines, or ATMs. Bank customers can use the ATMs to withdraw money from their accounts or to make deposits.

Types of Banks

The banks most people use are called commercial banks. Other kinds of banks do special things. Investment banks sell stocks and bonds. Credit unions make loans to workers. Savings banks and associations make loans to home buyers. Central banks—such as the Bank of England or the banks of the U.S. Federal Reserve System—are responsible for their country's money. International banks lend money to developing countries.

History

There was banking in ancient Mesopotamia at least 4,000 years ago. The first bankers kept gold and silver for people and also lent it out. In ancient

Greece and Rome there were companies very much like modern banks.

Florence and Venice, two cities in Italy, became banking centers in the 1400s. In England gold dealers served as bankers until the Bank of England was founded in 1694.

Many people in the United States did not want the U.S. government to control banking. The central Bank of the United States closed in 1836. But in 1913 the U.S. government set up the Federal Reserve System. This system oversees U.S. banks today.

Many banks failed during a period known as the Great Depression that started in 1929. Depositors at these banks lost their money. To protect depositors, the U.S. Congress set up the Federal Deposit Insurance Corporation (FDIC) in 1933. The FDIC gives depositors money if their bank fails.

Today banks use computers for nearly all their business. Customers often use their home computers for banking, too.

A woman uses an automated teller machine in Shanghai, China.

An illustration from the 1400s shows people using a bank in the city of Florence.

People can pay bills or transfer money between their bank accounts over the Internet.

Money

Banneker, Benjamin

A man of many talents, Benjamin Banneker was one of the first distinguished African American scientists and mathematicians. He was also an inventor and a writer.

Banneker was born on November 9, 1731, in Ellicott's Mills, Maryland. His father had been a slave, but Benjamin was free. Although he had little schooling, he grew up with a love of book learning.

Banneker attracted attention in his early 20s by designing and building a wooden

clock. It was the first clock of its type to be built in what is now the United States.

Banneker taught himself astronomy and in 1791 began to publish a yearly almanac. In it he tracked when the sun, Moon, and stars would appear in the skies on every day in the coming year. His almanacs were praised by European scientists. Banneker also wrote essays and pamphlets arguing against slavery and war.

In the 1790s Banneker helped to lay out the new national capital of Washington, D.C. When the city plans were lost, Banneker was able to reproduce them from memory. He died in Baltimore, Maryland, on October 25, 1806.

Barbados

The island country of Barbados lies at the eastern end of the West Indies, a group of islands in the Caribbean Sea. A longtime British colony, Barbados still shows the influence of British culture. Bridgetown is the capital and largest city.

Coral reefs surround Barbados. The surface of the island is also made of coral, which lies over rocks. There are no rivers or lakes and few hilly areas. Barbados has a moderate tropical climate with wet and dry seasons.

The most common plant on Barbados is sugarcane, which is grown on large plantations. Trees include mahogany and cabbage palm. Monkeys, hares, mon-gooses, and egrets are common animals. Green dolphins, barracudas, and parrot fish live in the surrounding waters.

Barbados is a densely populated island. About half of the people live in cities or towns. Most Barbadians have African

ancestors. Smaller numbers of people have mixed, British, U.S., or Asian ancestry. English is the official language of Barbados. Some people speak a form of English called Bajan. Most of the people are Christians.

The economy of Barbados is based on tourism and on the production of sugar and rum. Finance and other services are also important. Manufacturers make chemicals, paper, and metal products.

Arawak people may have lived on Barbados when the Spanish visited the island in the early 1500s. The English settled there in 1627. They built sugar plantations and brought slaves from Africa to work on them. Great Britain ruled the island until 1966. Barbados then became an independent country.

Bark

Bark helps protect trees from people, animals, and weather.

Bark is the outer layer of the trunk of a tree. Trees have an inner and an outer layer of bark.

The inner layer of bark is alive and continues to grow as the tree grows. It contains a tissue called phloem. Phloem carries the food that is made in the leaves to all the other parts of the tree.

The outer layer of bark is dead. As the living bark grows, it pushes outward and later dies. It then becomes the rough bark that is seen on the trunk of a tree.

Even though the outer layer of bark is dead, it is still very useful to the tree. It helps to keep water in the tree from escaping. It also protects the tree from injury by people, animals, and weather. In addition, the outer bark helps to keep out living things such as germs and fungi, which can cause diseases.

Barley

Barley is a valuable grain. Grains are grasses that produce seeds that can be eaten. Barley seeds are called kernels or barleycorns.

Barley was probably first grown in Ethiopia and Southeast Asia in ancient times. Today Russia, Canada, and Germany are leading barley producers.

A barley plant grows to about 1 to 4 feet (0.3 to 1.2 meters) tall. It has a thin stem and long, narrow leaves. At the ends of the stems are structures called spikes, which produce small flowers. The flowers develop into kernels. Each spike produces two to six rows of kernels, depending on the type of plant.

About half of the world's barley is used to feed livestock. The rest is used for human foods and for malting. Malted barley is soaked in water and then dried

Kernels of barley grow in neat rows.

with hot air. It is used mostly to make beer. A type called pearl barley is common in hot cereal and soups. Barley is also ground into flour and used to make flatbread and porridge, which is like oatmeal. The stems of barley plants are used as bedding and food for farm animals.

Barracuda

Barracudas are among the fiercest fish in tropical waters. They circle around groups of smaller fish until the fish huddle together in fear. The barracudas then dive in and slash the fish with their teeth. The species, or type, called the great barracuda will sometimes even attack human swimmers.

There are about 20 species of barracuda. They live in warmer parts of the Atlantic and Pacific oceans, including the Caribbean Sea. Fishers often catch them for sport and food. But barracudas that live in some seas can be poisonous.

Barracudas have long mouths filled with large, knifelike teeth. Their slender,

Barracuda

powerful bodies help them swim fast. They have two fins on the back and small scales on the body. Barracudas average about 3 to 4 feet (1 meter) in length. The great barracuda can reach a length of 8 feet (2 meters).

Barracudas travel far in search of food. They eat mainly smaller fish, such as mullets, anchovies, and grunts.

Barton, Clara

Clara Barton was called “the angel of the battlefield” for her work tending to wounded soldiers in the American Civil War. Later she organized the American Red Cross to aid the victims of all wars and disasters.

Clarissa Harlowe Barton was born on December 25, 1821, in Oxford, Massachusetts. She was educated at home. As a young woman she taught school in Massachusetts and New Jersey.

When the American Civil War began in 1861, Barton heard that Union (Northern) soldiers were suffering and dying because there were not enough bandages and other medical supplies. She organized a private agency to buy supplies. Starting in 1862 she herself worked as an unpaid nurse, aiding the wounded where they fell. After the war she led an effort to track down missing soldiers.

Did You Know?

Clara Barton helped the United States to agree to the Geneva Convention. The convention was an agreement that protected wounded soldiers.

Clara Barton

Some people in Europe also wanted to help soldiers wounded in battle. In 1863 these people founded the International Red Cross. In 1870, while Barton was staying in Europe, a war broke out between France and Germany. Barton tended the wounded under the Red Cross banner. She also studied how the organization worked.

Barton returned home in 1873 and worked to organize a branch of the Red Cross in the United States. She succeeded in 1881. Barton was head of the American Red Cross for 23 years. She expanded the mission of the organization to include helping victims of disasters in peacetime as well as in war. In 1904 Barton retired. She died on April 12, 1912.

Baseball

The sport of baseball has been called the national pastime of the United States. Each spring millions of fans look forward to the beginning of a new baseball season. Baseball is also popular in many Latin American and Asian countries, especially Japan. The game is played with a bat and a fist-sized ball. Two teams of nine players compete against each other. The goal is to score the most points, which are called runs.

Playing Area and Equipment

A baseball field is divided into an infield and an outfield. Within the infield is a square area called the diamond. There are four bases, one on each corner of the diamond. One base is called home plate. The others are called first, second, and third base. The bases are 90 feet (about 27 meters) apart. The outfield is a grassy area beyond the infield. A wall usually marks the outer boundary of the outfield.

A Boston Red Sox player bats during the 2004 World Series against the Saint Louis Cardinals.

A raised, circular mound is located in the middle of the infield diamond. A player called the pitcher throws the ball toward home plate from a spot on the mound. The spot is known as the rubber. In professional baseball the rubber is 60 feet, 6 inches (18.4 meters) from home plate.

A baseball has a core made of cork and rubber. Yarn is wrapped around the core. The cover is made of two strips of white leather that are sewn together. Players hit the ball with a bat. A baseball bat is a smooth, rounded stick made of wood or aluminum. To catch the ball, players wear leather gloves.

Playing the Game

The two teams in a baseball game take turns being batters (playing offense) and fielders (playing defense). The batting team, also called the team at bat, tries to score runs. It does this by advancing its players around the bases. The fielding team tries to prevent the batting team from scoring.

Play begins when the fielding team's pitcher throws, or pitches, the ball toward home plate. A batter tries to hit the pitched ball, called a pitch, out of the reach of the fielders. The fielding team tries to get the batters out. When a batter is called out his turn at bat is over.

The pitcher can get a batter out by throwing three strikes. This is called a strikeout. An umpire behind home plate calls each pitch either a strike or a ball. A strike is a pitch that passes through the strike zone. The strike zone

Baseball fields do not all look the same, but they all have certain features in common.

is an imaginary rectangular box above home plate. From bottom to top, it extends from the batter's knees to about the middle of his chest. The umpire calls a strike if the batter fails to swing at a pitch thrown in the strike zone. The batter also gets a strike for swinging at the ball and missing.

If a pitch is outside the strike zone and the batter does not swing, the umpire calls a ball. If the umpire calls four balls during a batter's turn at bat, the batter receives a walk. A walk lets the batter go to first base. The batter also goes to first base if a pitch hits him.

If the batter hits the ball onto the field, he tries to run to first base or farther without making an out. The fielders can get the batter out in a variety of ways. For example, they can catch a hit ball before it bounces. They can also scoop up the ball and throw it to first base before the batter gets there. With the ball in hand, a fielder may also tag the

batter out. If the batter safely gets to first base or farther, he is said to have gotten a hit.

After a batter reaches a base, he becomes a base runner. He tries to advance from base to base around the diamond. Usually he does this as the next batters get hits of their own. The batting team scores a run when a base runner goes all the way around the bases and returns to home plate.

After three batters have made outs, the fielding team takes its turn at bat. A period of play called an inning is completed after both teams have batted. After nine innings, the team with the most runs wins. If a game is tied, the teams play extra innings until the tie is broken.

History

Historians once thought that Abner Doubleday, a U.S. Army officer, invented baseball in 1839 in Coopers-town, New York. Now, though, most historians agree that baseball developed from an English game called rounders. English children played rounders in the 1700s. The game was quite similar to modern baseball. It had nine-member teams and a diamond-shaped infield with bases on the corners.

In 1845 Alexander Cartwright organized the Knickerbocker Base Ball Club in New York City. The club was made up of amateur players (players who were not paid). The club put together a set of rules for playing the game. Many of those rules are still used today.

In 1869 the Cincinnati Red Stockings began to pay players. The Red Stockings are considered to be the first professional baseball team. Two years later nine teams formed the first professional baseball association. In 1876 the National League was formed. The American League was founded in 1900 as a rival to the National League.

Today the National and American leagues are combined in the organization called Major League Baseball. As of 2006 there were 30 professional teams divided between the two leagues. Since 1903 the best teams from each league have competed in a championship called the World Series.

Amateur baseball is played in high schools and colleges. Younger children play baseball in the Little League system.

Did You Know?

The Cleveland Spiders of 1899 had one of the worst major league baseball seasons ever. They won 20 games and lost 134.

African Americans were not allowed to play in baseball's major leagues until 1947. Jackie Robinson was the first African American to join a team. In 1949 Roy Campanella, Larry Doby, Don Newcombe, and Robinson (from left) were the first to play in an All-Star game.

Each year the two best teams compete in the Little League World Series.

Basho

A woodblock print from the 1800s shows Basho standing and talking to two others.

Basho was one of the most important poets of Japan. He is considered the master of the haiku, a type of poem that has only three lines.

Basho's original name was Matsuo Manefusa. He was born in 1644 near Kyoto, Japan. Basho was a member of the samurai, a class of warriors. He worked for a landowner, and the two men wrote poetry together.

After the landowner died in 1666, Basho devoted himself to writing. He published his first poems in 1671 and soon began attracting students and admirers. In 1680 his students built him a house. They planted a basho, or

banana plant, in the yard. That plant was the source of his pen name.

Basho forever changed Japanese poetry. Earlier haiku were playful and silly. But Basho wrote serious artistic haiku. Many of his poems were about nature. Soon other poets began copying his style. Basho also became known for his poetic diaries. He wrote them during four long journeys he took on foot across Japan. The diaries include descriptions of the places he visited, his thoughts, and many short poems. The most famous is *The Narrow Road to the Deep North*. Basho died while on a journey in 1694.

Did You Know?

A haiku is a very short poem. It has three lines that have five, seven, and five syllables each.

Basketball

Basketball is a fast-paced and exciting sport. It is very popular in the United States, where it began in the 1890s. It has also become popular in many other countries. In a basketball game two teams of five players compete. The goal is to score more points than the other team. Players score by tossing, or shooting, a ball through a raised goal called a basket.

Playing Area and Equipment

Basketball is played on a rectangular court. A professional basketball court is 94 feet (28.7 meters) long and 50 feet (15.2 meters) wide. High school and international courts may be slightly smaller.

Every U.S. professional basketball court has the same dimensions.

Each end of the court has a basket. The basket is a metal ring with a net hanging from the rim. It is attached to a backboard, which is usually made of strong glass. The rim of the basket is 10 feet (3 meters) above the floor of the court. A basketball is round and full of air, which makes it bounce well.

Playing the Game

A basketball team has five players: two forwards, two guards, and a center. The players are named for the different positions, or roles, that they play on the court. In general, the players at each position have special abilities and duties. For example, guards usually excel at moving the ball down the court and passing it to teammates.

Basketball players play both offense and defense. When a team has the ball, it is on offense and tries to score points. The other team plays defense—it defends the basket at its end of the court. The defensive team tries to keep the other team from scoring. It also tries to gain control of the ball by taking it away from the offensive team.

Play begins with a jump ball. A referee tosses up the ball between two opposing players in the middle of the court, inside a circle called the center circle. The two players jump for the ball and try to tap it to a teammate. The other players stand outside the center circle, ready to catch the ball. The team that gets control of the ball plays offense first.

The offensive team tries to advance the ball toward the defensive team's basket. Offensive players can pass the ball to teammates. They can also move the ball down the court by themselves. However, players cannot run freely with the ball. They must dribble, or bounce, the ball on the court as they run with it.

Any player with the ball may take a shot at the basket. Most successful shots score two points. Very long shots, from behind a line called the three-point line, score three points.

The defensive team tries to keep the offense from getting a good shot at the basket. When a shot is missed, both teams try to recover the ball. This is called rebounding. If the offense gets the

As one player tries to get the ball in the basket another raises his hand to try to stop him.

ball on the rebound, it can try to take another shot. If the defense gets the rebound, then it becomes the offense. It tries to move the ball down the court to the opponent's basket. The defense can also get the ball by taking it away, or stealing it, from the offense. Defenders can make a steal when the offense is passing or dribbling the ball.

A group of officials makes sure that the players follow the rules. The officials penalize a team when one of its players breaks a rule. For example, if an offensive player runs without dribbling the ball, the officials give the ball to the defense. Some penalties are called fouls. Most fouls happen when one player makes physical contact with another player. For example, officials call fouls for bumping, pushing, and tripping. The player who is fouled often gets to take shots without having to worry about the defense. These shots are called free throws. They score one point.

History

James Naismith invented basketball in 1891. Naismith was a physical education teacher in Springfield, Massachusetts. His school asked him to create a sport that students could play indoors during the winter. The first basketball game had peach baskets as the goals. That is why the sport was named basketball. The metal hoop was not invented until 1906.

Basketball quickly became popular throughout the United States. Both men and women started playing basketball at the college level in the early 1890s. The first professional basketball league in the United States was formed in 1898. The National Basketball Association (NBA) started in 1949. It is the main professional league in the United States today.

Outside the United States, basketball developed more slowly. Men's basketball became an Olympic event in 1936. International world championships began in 1950 for men and in 1953 for women. Women's basketball was added to the Olympics in 1976.

The NBA grew especially popular in the 1980s. More games were televised than ever before. Outstanding players such as Magic Johnson, Larry Bird, and Michael Jordan attracted many new fans.

The first women's professional leagues in the United States began during the 1970s. They failed after a year or two. The current Women's National Basketball Association (WNBA) began in 1997.

Did You Know?

James Naismith's original rules of basketball did not allow players to run with the ball. They had to throw it from the spot where they caught it.

Basketball is a very popular sport at the college level for both men and women.

High school and college championship tournaments are traditionally held in March. There are separate tournaments for both men's and women's teams.

Basque

The Basques are a people with a unique history and culture. Most Basques live in northern Spain, but some live in southern France. They have lived in this region for many hundreds of years. Some Basques have moved away from Europe, mostly to South America and the United States.

The Basques have a unique language called Euskara. It is unlike any other European language. Some Basques who

live in the mountains still speak Euskara. However, most Basques speak either Spanish or French.

The Basques traditionally were farmers. They also sailed far over the Atlantic Ocean to fish and hunt whales. In more recent times they have built large industrial towns. Their factories make lumber, furniture, iron, and steel.

For many years some Basques living in Spain have not liked being under Spain's control. They have worked to get more control over their region. In 1978 the Spanish government gave the Basques in Spain some of the freedom they wanted. For example, the Basques won the right to make their own laws.

However, some Basques want to break away from Spain completely. Their goal is to form an independent Basque nation. Some of these Basques belong to a terrorist group known as the ETA.

People carrying Basque flags attend a rally for Basque independence held near Bilbao, Spain.

They have killed Spanish officials and performed other acts of violence.

Bass

The fish called bass are valued all over the world as a source of food. There are hundreds of different species, or types, of bass. Many of them belong to the sea bass family. Others, such as black bass, belong to the sunfish family. Some fish in other families are also called bass.

Most bass have a spiky fin running along their back. Many are dark on top with a pale belly. Bass vary greatly in size. Rock bass are about 6 inches (15 centimeters) long. By contrast, giant sea bass may be more than 6 feet (2 meters) long and more than 500 pounds (225 kilograms) in weight.

Sea bass are large-mouthed ocean fishes that usually prefer warmer waters. They are usually large. Some can change color. Sea bass feed on fish, mollusks, and smallmouth black bass

European sea bass

other small animals without spines. They also eat crustaceans, which are animals that live in shells.

Black bass live in the freshwater ponds, rivers, and lakes of North America.

Largemouth black bass have an upper jawbone that extends beyond their eyes. Their body varies in color from green to black, with a dark, horizontal stripe. Smallmouth black bass are smaller and have a green to brownish color. Black bass feed on smaller fishes.

Basseterre

Population
(2006 estimate)
12,900

Basseterre is the capital of Saint Kitts and Nevis, an island country in the Caribbean Sea. The town is located on the coast of Saint Kitts Island. It is the country's largest town and main port. Basseterre is also a center for shipping goods to nearby islands. Its chief industries are tourism and sugar processing.

The French founded Basseterre in 1627. The British took over Basseterre and the rest of Saint Kitts and Nevis in 1783. A fire destroyed Basseterre in 1867, but

the town was rebuilt. In 1983 Saint Kitts and Nevis became an independent country. Basseterre became its capital.

Bastille Day

Jets trail the French national colors at a Bastille Day parade in Paris, France.

The French celebrate their freedom each year on July 14. On that day in 1789 an angry mob attacked the Bastille, a state prison in Paris. The mob associated the prison with the harsh rule of the king of France. The attack is therefore considered the beginning of the French Revolution, which forced the king to give up control of the country. French people celebrate the day much as Americans celebrate the Fourth of July, with parades, speeches, and fireworks.

Bastille Day was first celebrated in 1790, but it did not become a French national

holiday until 1880. Long before that, the Bastille itself was torn down.

Bat

Bats are the only mammals that can truly fly. Sometimes people mistake bats for birds. But bats are more closely related to other mammals—including humans—than they are to birds. And bats do not have feathers.

Where Bats Live

There are about 900 species, or types, of bat. Bats are found worldwide, especially in the tropics. They usually rest in dark places such as caves, hollow trees, or attics.

Physical Features

Bats have fur that is usually gray, tan, brown, or black. They vary greatly in size, depending on the species. Their wings can measure from 6 inches (15 centimeters) to 5 feet (1.5 meters) across when spread open. Their ears point forward and are usually very large.

A leaf-nosed bat flies in the night.

The wings consist of thin layers of bare skin. They stretch from the long arms down to the legs.

Behavior

Most kinds of bat live in large groups. Nearly all bats rest during the day. Most bats eat flying insects. Some kinds eat small animals such as birds, frogs, mice, and fish. Other kinds eat fruit or the pollen and nectar from flowers. The vampire bats of South and Central America feed on the blood of mammals and large birds.

While flying, most bats send out a cry. This cry is so high-pitched that people cannot hear it. The sounds bounce off objects and echo back to the bat. The bat can figure out the distance and size of the objects based on the returning sounds. Bats use this information to avoid flying into objects in their paths and also to find insects to eat.

Baton Rouge

Population
(2000 census),
city, 227,818;
(2007 estimate)
227,071

Baton Rouge is the capital of the U.S. state of Louisiana. The city is located on

the Mississippi River. It is one of the leading U.S. ports. Goods brought to the port by rail and river are transferred to oceangoing ships. Baton Rouge is also a center of industry and services. Its chief industries process oil and natural gas.

The French founded Baton Rouge in 1719. The city and its surrounding area changed hands several times. The British gained control of Louisiana in 1763. But the Spanish captured it in 1779. In 1800 France again took control of Louisiana. A few years later the United States bought Louisiana from France. Louisiana became a U.S. state in 1812. Baton Rouge became the state capital in 1849.

Battery

Batteries give electric power to flashlights, radios, cell phones, handheld games, and many other types of equipment. A battery is a sort of container that stores energy until it is needed. Chemicals inside the battery store the energy. When the battery is used, the chemical energy changes into electric energy.

How Batteries Work

Inside a battery there are two pieces of metal in a liquid or a paste. The metal parts are called electrodes. The liquid or paste, called an electrolyte, is a mix of chemicals. Each electrode has a point, called a terminal, that sticks out of the battery.

Did You Know?

"Baton rouge" means "red stick" in French. French settlers named the town for a post they saw that marked a boundary between Native American territories.

In some flashlights, two or more batteries produce an electric current. The current flows out of the batteries, through a wire, and through a lightbulb.

For a battery to work, the terminals must be linked by an outside wire. Then the chemicals in the electrolyte cause tiny particles called electrons to flow out of one electrode's terminal (the negative terminal). The electrons travel along the wire back to the other terminal (the positive terminal). This flow of electrons is an electric current. The wire usually runs through a lightbulb or other device

before returning to the battery. The current flowing through the wire makes the device work.

Types of Batteries

There are two basic types of batteries. A battery that can be used only once is called a primary battery. When the metals or electrolyte is used up, the battery can no longer make electricity. The batteries used in flashlights, radios, and toys are primary batteries.

A battery that can be used more than once is a secondary battery. Car batteries and some batteries used in telephones and medical equipment are secondary batteries. Secondary batteries can be recharged with an electric current from another source. For example, a person can recharge a cell phone battery by plugging the cell phone into an electric socket in a wall.

Bean

Beans are seeds that people often eat. They are an excellent source of protein. Beans are used in many dishes, including soups and chili.

Many different plants produce beans, but they are all members of the same scientific family. The family includes peas, peanuts, and lentils as well as beans. These plants grow in most parts of the world. Most types grow either as a bush or as a climbing plant.

Beans come in many different shapes, sizes, and colors.

Beans come in many colors—white, green, yellow, tan, pink, red, brown, purple, and black. They also have different shapes. Some are nearly round or oval. Others are flat or kidney-shaped.

Beans grow inside cases called pods or legumes. Pods are usually 3 to 8 inches (7.6 to 20 centimeters) long. They come in shades of green, yellow, red, and purple. Many pods are too tough to eat. This is why beans are usually taken out of the pod. Some pods can be eaten if

they are picked at an early stage in their growth. These include green beans (also known as snap or string beans).

Dry beans are grown only for their dry seeds, not the pods. They include pinto, lima, navy, black, kidney, fava, and mung beans.

One of the most useful beans is the soybean. Many chemical products, including paint, are made from soybean oil. Soybeans are fed to farm animals. They are also a rich source of protein for people around the world. They are used to make soy milk, soy sauce, and tofu.

Bear

Bears are large, powerful mammals related to dogs and raccoons. The biggest bears are the world's largest animals that live on land and eat meat.

There are several species, or types, of bear. They are the polar bear, the brown bear, the black bear, the Asiatic black bear, the sun bear, the spectacled bear, and the sloth bear. The brown bear is commonly called the grizzly bear in North America. Most scientists also consider the giant panda to be a member of the bear family.

Where Bears Live

Bears are found in the Americas, Europe, and Asia. They are often found in mountainous areas and forests. The black bear lives in North America. The

Many beans are taken out of the pod before they are eaten.

Did You Know?

The polar bear has fur on the bottom of its feet. This fur helps the bear to keep from slipping on ice.

A polar bear travels over snow and ice in the Arctic region of Canada.

brown bear is found in North America, Europe, and Asia. The Asiatic black bear and the sloth bear live in parts of Asia. The world's far northern regions called the Arctic are home to the polar bear.

Physical Features

Bears range in height from about 3 to 10 feet (1 to 3 meters). The sun bear is the smallest species. A kind of Alaskan brown bear called the Kodiak bear is the largest bear. It may weigh 1,720 pounds (780 kilograms). Some polar bears are almost that big.

Most bears are mainly brown, red-brown, or black. Some have white markings on the chest or face. The type called

the black bear is sometimes actually brown, blue-gray, or even white. The polar bear's white fur helps it blend in with the Arctic ice and snow.

A bear has a broad head, a heavy body, short legs, and a small tail. Bears have poor eyesight but an excellent sense of smell. Most kinds are good at climbing trees and at swimming.

Behavior

Bears are carnivores, or meat eaters. For example, the polar bear eats seals, walrus, and fish. However, other bears eat a lot of plants as well as animals. They may eat roots, seeds, berries, and nuts in addition to insects, fish, and deer.

In the autumn most bears eat a lot to put on extra fat. They then sleep through most of the winter. This is similar to a very deep resting state called hibernation. But bears are not true hibernators. Their body temperature, heartbeat rate, and breathing rate do not drop much lower than normal.

Beatles, The

The Beatles were one of the most successful and influential pop-music groups of the 1960s. This quartet of British musicians were rhythm guitarist John Lennon (October 9, 1940–December 8, 1980); bass guitarist Paul McCartney (born June 18, 1942); lead guitarist George Harrison (February 25, 1943–November 29, 2001); and drummer

Ringo Starr (originally Richard Starkey; born July 7, 1940).

Beginnings

Lennon formed a band in Liverpool, England, while in high school in the mid-1950s. McCartney and then Harrison joined the group in the late 1950s. In its early years the band also had several other members. In 1962 they signed a recording contract with a large music company. At about this time they chose Starr to replace drummer Pete Best.

At first the Beatles' songs were upbeat and fairly simple. The first song recorded by the Beatles was "Love Me Do" in 1962. Their first hit came the following year, when "Please Please Me" climbed to the top of the British music charts.

Beatlemania

The Beatles became very famous in Britain. People started calling the excitement over the band Beatlemania. The Beatles became wildly popular in the United States too after appearing on Ed Sullivan's television program in February 1964. Teenage girls across the country screamed and fainted over them, and boys copied the Beatles' look. By April 1964 the top five hits in the United States were all Beatles songs.

Later Years

In the late 1960s the Beatles began creating more adventurous music, combining different musical styles. The album *Sergeant Pepper's Lonely Hearts Club Band* (1967) showed a new complexity.

The Beatles were John Lennon, George Harrison, Paul McCartney, and Ringo Starr.

The band also recorded the albums *The Beatles* (1968), *Abbey Road* (1969), and *Let It Be* (1970).

The pressures of fame led the Beatles to break up in 1970. All four continued their musical careers—Lennon with his wife, Yoko Ono; McCartney with the band Wings and later as a solo performer; and Starr and Harrison mainly as solo artists.

Bee

Bees are insects related to wasps and ants. They live all over the world except Antarctica. There are more than 20,000 species, or types, of bee. The best-known kinds are honeybees and bumblebees. People have kept honeybees for their honey for at least 4,000 years. Honeybees also produce beeswax, which people use to make candles.

Physical Features

Adult bees range in length from about 0.08 to 1.6 inches (0.2 to 4 centime-

Worker honeybees surround a queen as she lays eggs.

ters). They usually have a short, thick body covered with hair. Most bees are black, often with yellow or brown markings. Like all insects, bees have six legs. They have two pairs of wings and five eyes. They also have mouth parts that act like a long tongue. Female bees also have a stinger. Male bees cannot sting.

Role in Pollination

Bees get all their food from flowers. This food consists of a sweet liquid called nectar and a dustlike substance called pollen. Honeybees change nectar into honey, which they feed to their young. Bees also gather pollen to feed their young. As they go from flower to flower, they spill some pollen. In this way bees perform a very useful task. When pollen spreads from one flower to another of the same kind it allows the flowers to make seeds and therefore to make new flowers.

Behavior

Most kinds of bee live in small families. But some bees live in large, organized groups that work together. These social

bees include honeybees and some bumblebees. They are divided into classes. Most of the females are workers. They gather pollen, build the nest, and take care of all the young. Each nest has one queen. Her eggs develop into females. The workers' eggs develop into males. Male bees, called drones, help the queen reproduce.

Beet

Beets are vegetables. They come in four different types. The garden beet, the sugar beet, Swiss chard, and the mangelwurzel are all varieties of the same plant. This plant's scientific name is *Beta vulgaris*. It is related to spinach.

Garden beets, or beetroots, have red roots that are often eaten after being cooked or pickled.

Beets grow in Europe, Asia, and North America. The beet plant is a biennial, which means that it lives for two years. The root forms in the first year. In garden beets, the root is thick and usually round. It measures 1 to 4 inches (2.5 to 10 centimeters) across when fully grown. The roots of garden beets are usually red or purplish red. Sugar beets have white roots. Those of mangel-wurzels are yellowish. Swiss chard does not have thick roots.

In the second year, a stem grows. It is tall and leafy. The stem has groups of small green flowers. These flowers become brown fruits called seedballs.

The leaves of the garden beet are a good source of vitamins A and C. Many people also eat its root. A beet soup called borscht is popular in eastern Europe. Swiss chard is grown for its large leaves, which are used in cooking. Mangel-wurzels are mostly fed to cattle.

The sugar beet is the most valuable type of beet. In 1747 a German chemist first made sugar from beets. Today about one third of the world's sugar comes from sugar beets.

Beethoven, Ludwig van

The composer Ludwig van Beethoven created some of the most influential music in history. He transformed many traditional forms of Western classical music. For example, he set new stan-

A portrait of Ludwig van Beethoven shows him writing his music.

dards for the symphony, creating longer pieces that expressed important ideas and deep feelings rather than just serving as entertainment. His works include nine symphonies, one opera, and many pieces for small groups and for piano and other solo instruments.

Early Life and Career

Beethoven was born in Bonn, Germany, in December 1770. He learned musical composition from the official organist in a nobleman's court. Beethoven became the assistant organist at age 11 and published his first musical composition soon after.

In 1787 Beethoven studied briefly with the great composer Wolfgang Amadeus Mozart in Vienna. Five years later Beethoven settled in Vienna permanently. There he studied with Joseph Haydn and other famous composers.

Did You Know?

Beethoven could not hear the audience clapping when his *Ninth Symphony* was first played. He did not know that they liked it until he turned to look at them.

Growing Fame and Deafness

Beethoven became known as a highly skilled piano player. Many of Vienna's wealthy residents enjoyed his music and gave him money to live on. In 1800 he performed some of his works at a large public concert in Vienna. This event helped him become widely famous.

In the late 1790s Beethoven began to lose his hearing. For some time he continued to compose and perform as before. But by 1819 Beethoven had become totally deaf. From then on he no longer performed much in public, spending most of his energy composing music.

In his last years Beethoven created longer and more complicated pieces. In 1824 he conducted the first performance of his *Ninth Symphony* with great success despite being unable to hear the music. Beethoven died in Vienna on March 26, 1827. The masterpieces he created continue to be performed nearly two centuries after his death.

Beetle

Beetles are insects that have hardened front wings. These front wings are not used for flying. Instead, they cover and protect a second pair of wings. In the past all beetles could fly. But some kinds have lost that ability over time.

There are at least 250,000 species, or types, of beetle. Some beetles are called

by other names, such as weevils, fireflies, ladybugs, borers, and chafers. Beetles are found all over the world except Antarctica and the peaks of the highest mountains. Most live on land, but some live in water.

Beetles vary greatly in size. Adult beetles range in length from about 0.01 inch (0.025 centimeter) to more than 7 inches (18 centimeters). Many kinds are colorful. They may be bright orange, red, yellow, green, or blue. Some kinds are black or brown.

Adult beetles have two antennae, or feelers, on the head. These help beetles find food and recognize other beetles. Like all insects, they have six legs. A hard covering protects the body.

Beetles eat a great variety of foods, including other insects, small animals, and plants. Some kinds are useful to humans because they eat insect pests, garbage, or decaying meat. Other kinds are harmful. They destroy crops, spread disease, or eat clothing and carpet.

Many beetles produce light and sound to attract a mate or frighten an enemy. They make light by mixing chemicals inside special organs. They make a high-pitched sound by rubbing together two hard body parts.

Beetles hatch from eggs. The newborn beetles do not look like adult beetles. Over the course of their lives, their form changes completely. Their bodies change in three stages: larva, pupa, and adult. This process is called metamorphosis.

Beijing

Population
(2007
estimate), urban
area,
11,106,000

Beijing is the capital of China, a country in eastern Asia. The city sits between two rivers on a plain in northeastern China. Beijing is an old city that has played an important role in China's history. It has been China's center of government for almost 800 years. It is also the country's main center of industry, education, and culture.

Places of Interest

A huge plaza called Tiananmen Square is often the site of political celebrations. Many museums and monuments are located there. At one end of the square is a large gate called the Tiananmen. It has become a symbol of China.

Through this gate is the Forbidden City, a group of buildings from the 1400s. It contained the palaces of several emperors. The Forbidden City was so named because for many years common people were not allowed there. It is now a museum that is open to the public.

Beijing is famous for its many parks. The Summer Palace is known for its beautiful landscaping and buildings, including temples and bridges. Tiantan Park contains the Temple of Heaven, where emperors used to pray. Beihai Park was built in the 1600s. Today, its

The Temple of Heaven in Beijing is more than 500 years old.

Hundreds of children show their martial arts skills in Beijing, China.

large lake is filled with boats in the summer and ice skaters in the winter.

Economy

Factories in Beijing make cloth, cars, electronics, computers, and machinery. Unlike in many large cities, farmers grow fruits and vegetables in the city itself. Tourism also brings money to Beijing.

History

People have lived in the Beijing area for thousands of years. Several towns were built on the site and later destroyed. In the 1200s the Mongol leader Kublai Khan built the city of Dadu on the site. He made Dadu the capital of China. Except for a few brief periods, the city has been China's capital ever since.

The city was renamed Beijing in the early 1400s. It was known as Peking in the United States and other Western countries until the early 1980s. "Beijing" is now the official way to write the city's name in English.

In 1989 students held a protest against the government in Tiananmen Square. Government forces brought in tanks and killed many people to break up the protest. People around the world criticized the government for its actions. In the 1980s and '90s, three of Beijing's historical areas were named World Heritage sites by a branch of the United Nations. They were the Forbidden City, the Summer Palace, and the Temple of Heaven.

Beirut

Population
(2003 estimate)
1,171,000

Beirut is the capital of Lebanon, a country in the Middle East. The city spreads over two hills along the coast of the Mediterranean Sea. Beirut is Lebanon's main port and largest city. It was once the most modern city in the Middle East. However, a war in the late 20th century caused a lot of damage there.

Tourism, banking, and other services are important to the economy. Trade through the port also brings money to the city. Other major industries include printing and food processing.

Modern buildings stand among the ruins of ancient structures in Beirut.

Beirut is an ancient city. It has been conquered, destroyed, and rebuilt a number of times. Over the centuries it was ruled by Romans, Christian Crusaders, and Arabs. Beirut was part of the Turkish Ottoman Empire from the 1500s to the early 1900s. After World War I (1914–18) the French ruled Lebanon. They made Beirut the capital. Lebanon became an independent country in 1943. Beirut remained its capital.

Groups of Lebanese Muslims and Lebanese Christians fought each other in a civil war from 1975 to 1991. During the war Beirut was divided into two sections—a Christian East Beirut and a Muslim West Beirut. After the war the city remained divided, but it began to rebuild its damaged buildings and economy. In 2006 the city was damaged again in fighting between the Lebanese Muslim group known as Hezbollah and forces from Israel.

Did You Know?

Beirut has been a center for education since ancient times. The American University of Beirut became a respected school during the 1900s.

Belarus

Belarus is a country in eastern Europe. Its capital and largest city is Minsk.

Belarus shares borders with Russia, Poland, Ukraine, Lithuania, and Latvia. Most of the country is flat, except for central low hills. There are many wetlands, including the Pripet Marshes in the south. Belarus has cold winters and cool summers.

Silver birch trees grow throughout Belarus. Pines and spruces grow in the north, while oak and hornbeam trees grow in the south. Elk, deer, boars, and European bison live in the forests. Birds include partridges and ducks.

Belarusians make up the largest ethnic group, followed by Russians. Most people speak Belarusian and Russian. Less than half the people are Christian; the rest are nonreligious. More than two thirds of the people live in cities.

People dance around a burning scarecrow in Minsk, Belarus. The festivities are part of a celebration marking the end of winter.

Banking and other services, manufacturing, and mining are important to Belarus' economy. Manufacturers make machinery, chemicals, and food. Mines provide potash, which is used to make fertilizers. Belarus is also a leading producer of peat, a type of fuel. Farmers grow potatoes, sugar beets, barley, and rye.

Slavic people settled in what is now Belarus between the AD 500s and 700s. Over the years the area was controlled by various foreign powers, including Russia, which took over in the 1700s. In 1922 Belarus became part of the Soviet Union. In 1986 an accident at the Chernobyl nuclear power plant in Ukraine led to many health problems in Belarus. In 1990 Belarus broke away from the Soviet Union. In 1991 it declared full independence.

Belfast

The United Kingdom is a country in western Europe that is made up of four main parts: England, Scotland, Wales, and Northern Ireland. Belfast is Northern Ireland's capital and largest city. The city is located in the northeastern part of the island of Ireland. It lies where the Lagan River flows into a part of the Irish Sea.

The economy of Belfast is based mainly on service industries, such as health care, social services, and tourism. The city is Northern Ireland's center of trade, bank-

ing, and education. It is also the main seaport in Northern Ireland.

People have lived in the Belfast area for thousands of years. Belfast began as a small fishing village. In the 1600s Scottish and English settlers formed a colony in the area. They built up a large industry that made linen cloth.

Belfast and the rest of the island of Ireland became part of the United Kingdom in 1801. In 1920 the southern part of the island became the separate country of Ireland. Belfast was made the capital of Northern Ireland, which remained in the United Kingdom.

Throughout much of the 1900s Belfast was torn by violent conflicts between its two main groups—Protestants and Roman Catholics. They fought about whether Northern Ireland should stay in the United Kingdom or join Ireland. The United Kingdom is mainly Protestant, while Ireland is mostly Catholic. Most of the city's people are Protestant.

In the late 1960s Belfast's Catholics protested against unfair treatment by the Protestants. Deadly violence broke out. Many people left the city in the 1970s and 1980s because of the violence and the loss of manufacturing jobs. The fighting lasted until a peace agreement was signed in 1998. After that the city was more stable, and its economy improved. However, clashes broke out again in the early 21st century.

Did You Know?

Belfast is famous for its shipbuilding. The passenger ship *Titanic*, which sank during its first trip in 1912, was built in Belfast.

Queen's University is the oldest university in Belfast. It was founded in 1845 by Victoria, queen of the United Kingdom.

Northern Ireland • United Kingdom

Belgium

The Kingdom of Belgium is a small, prosperous country in northwestern Europe. Brussels is the capital and largest city.

Geography

Belgium is bordered by The Netherlands, Germany, Luxembourg, and France. The North Sea lies to the northwest.

Belgium is divided into three main regions. Lower Belgium, in the north, is flat and low. Middle Belgium, in the central part of the country, has many farms on its plains. Upper Belgium, in the south, includes the Ardennes highlands and forests. Most of Belgium's wild animals—including boars, wildcats, deer, and pheasants—are found in the Ardennes.

People

Belgians are divided into two main groups. More than half of the people are

The Ardennes is a region of hills and forests in the south of Belgium.

Flemings, who live mostly in the north. About one third are Walloons, who live mostly in the south. The Flemings speak Netherlandic, also known as Flemish or Dutch. The Walloons speak French. A smaller number of people speak German. Most Belgians are Roman Catholics. Most of the people live in cities.

Economy

Banking and other services, manufacturing, and international trade are the most important parts of Belgium's economy. Manufacturers make chemicals, food products, cars and car parts, and machinery. The city of Antwerp is a center of diamond cutting and dealing. Farming is only a small part of the economy.

History

Belgium takes its name from the Belgae, a group of Celts who settled in

The city of Brugge in northwestern Belgium is known for its network of canals.

the region during prehistoric times. The Romans, led by Julius Caesar, conquered the area in 57 BC. Germanic Franks took control of the area in the AD 400s and converted the people to Christianity. By the end of the 800s Belgium was divided into many independent territories. Flemish towns became centers of international trade during the Middle Ages.

Foreign Rule

In the 1300s Belgium came under the control of Burgundy, a territory that included part of France. The Hapsburgs, a powerful German family, ruled Belgium for most of the 1500s through the 1700s.

In 1795 France seized Belgium. Following the defeat of French emperor Napoleon I in 1815, Belgium passed to the mostly Protestant country of The Netherlands. The many Roman Catholics in Belgium fiercely resisted Dutch rule. In 1830 the Belgians rose up in rebellion,

and the following year they proclaimed the independent Kingdom of Belgium.

Independence

In the late 1800s Belgian king Leopold II gained control of a colony in the Congo region of Africa (now the Democratic Republic of the Congo). The Belgians ruled their colony, sometimes harshly, until 1960.

During World War I (1914–18) and World War II (1939–45) Germany invaded and occupied Belgium. During World War II the Nazis sent hundreds of thousands of Belgians to Germany and forced them to work.

After World War II Belgium supported the peaceful cooperation between the countries of western Europe. It was a founding member of the North Atlantic Treaty Organization (NATO) and the European Economic Community (later called the European Union).

During the 1960s tensions grew between Flemings and Walloons. The government divided Belgium into three language regions: Flemish Flanders, French Wallonia, and bilingual Brussels. In the 1990s the regions gained more power to govern their own affairs, such as education, transportation, and cultural matters. They shared other powers with the national government. The king kept little political power.

A crowd of students gathers at Saint Sava Church in Belgrade for a peace celebration.

for the government or in service industries, such as education and banking. Serbia's best farmland is also in the Belgrade region.

Belgrade has long been an important city because of its location. Several land and river trade routes meet at the city's site. Celtic people settled the site in the 300s BC. The town was later attacked and rebuilt many times. In AD 1284 a group called the Serbs captured Belgrade. In 1402 they made Belgrade the capital of their kingdom. The Turkish Ottoman Empire ruled the city from 1521 to the 1800s. In the late 1800s Belgrade again became the capital of Serbia.

In the 1900s fighting damaged Belgrade many times, including during World Wars I and II. In 1918 the city became the capital of the new Kingdom of Serbs, Croats, and Slovenes. That country was later renamed Yugoslavia. In the early 1990s parts of Yugoslavia broke away, leaving only Serbia and neighboring Montenegro in the country. In 1999 a part of Serbia called Kosovo tried to break free. International forces bombed Belgrade during the conflict.

In 2003 Yugoslavia changed its name to Serbia and Montenegro. The government remained in Belgrade. In 2006 Serbia and Montenegro split, and Belgrade became the capital of Serbia.

Belize

The Central American country of Belize was Great Britain's last colony on the American mainland. The capital is Belmopan.

Belize is bordered by Mexico and Guatemala. The Caribbean Sea lies to the east. Rain forests cover much of the interior. The Maya Mountains run through the south. Lowlands lie along the coast. The climate is warm year-round. Hurricanes may occur from July through November, during the rainy season.

Forests of mahogany, sapodilla, and other trees cover almost half of Belize. Grasslands and mangrove trees cover the coastal lowlands. Wild animals include jaguars, tapirs, American crocodiles, and manatees.

The people of Belize include mestizos (people with both European and Mayan roots), Creoles (those with European and African roots), Maya Indians, and Gari-

funa (those with African and Caribbean Indian roots). There are also some whites and Asians. English is the official language, but people speak many local languages. Most of the people are Christian. About half of the people live in cities.

Tourism and trade are the most important parts of Belize's economy. But many people in Belize earn their living from farming. Sugarcane, oranges, grapefruit, and bananas are among the main food crops. Fishing and logging are important, too. Belize's exports include shrimp, sugar, fruit, and clothing.

The Maya lived in what is now Belize from about AD 300 to 900. The Spanish came in the 1500s. British loggers settled there in the 1600s. In 1862 Great Britain made the area the colony of British Honduras. Belize gained independence in 1981.

Bell, Alexander Graham

Did You Know?

Alexander Graham Bell also invented a machine called a photophone. It transmitted sound on a beam of light.

Alexander Graham Bell was an inventor and a teacher of the deaf. He is famous for creating one of the world's most important communication devices—the telephone.

Alexander Graham Bell was born in Edinburgh, Scotland, on March 3, 1847. Alexander was mostly schooled at home. As a young man Alexander worked with his father to teach deaf people to speak.

In the mid-1870s, Bell began work on the telephone with Thomas Augustus Watson. On March 10, 1876, Bell made the first successful test of the telephone. He spoke a few words to Watson, beginning with “Mr. Watson, come here.”

At the Centennial Exposition of 1876 in Philadelphia, Pennsylvania, Bell and

Alexander Graham Bell demonstrates his telephone in 1876.

Watson demonstrated the telephone to the public. People were amazed by this new device. In 1877 Bell established the Bell Telephone Company.

After his success with the telephone, Bell pursued his interests in science, invention, and the education of deaf people. In 1890 he founded an organization in Washington, D.C., to teach speech to hearing-impaired people. This organization later became the Alexander Graham Bell Association for the Deaf and Hard of Hearing.

Alexander Graham Bell died on August 2, 1922. At the time of his burial, every telephone of the Bell system in the United States and Canada was kept silent for one minute.

Bell, Cool Papa

The baseball player called Cool Papa Bell is known as one of the fastest base runners of all time. He was elected to the Baseball Hall of Fame in 1974.

James Thomas Bell was born on May 17, 1903, in Starkville, Mississippi. He began playing baseball as a professional at age 19. At the time, African Americans were not allowed to play for major league teams. They played instead for teams in the Negro leagues.

Bell earned the nickname Cool Papa as a young pitcher. One day he struck out Oscar Charleston, a future Hall of Fame

Cool Papa Bell

player, without showing any nervousness at all. Later, after hurting his pitching arm, Bell played in the outfield.

Bell's career lasted from 1922 to 1950. He played for several different Negro league teams as well as for leagues in Mexico and the Dominican Republic. In 1940 he won the Mexican League's triple crown, leading the league in batting average, home runs, and runs batted in.

Bell's outstanding talent was his speed. It is believed that he once stole 175 bases in less than 200 games. The most famous story about his speed was told by his old roommate Satchel Paige. Paige joked that Cool Papa could turn out the hotel room lights and be in his bed before the room got dark!

Bell finished his baseball career in 1950 as a player-manager of a team in Kansas City. He died on March 7, 1991.

Belmopan

Population
(2007 estimate)
16,435

Belmopan is the capital of the small Central American country of Belize. Most people in the city work for the government of Belize.

Belize City was once the capital of Belize. Floods from a hurricane damaged Belize City in 1961. The government of Belize decided to build a new capital. It chose a site away from the coast to avoid flooding. Work began on Belmopan in 1966. The government offices moved there in 1970. But few people moved there besides government workers.

Benin

Benin is a country on the west coast of Africa. Porto-Novo is the capital, but many government offices are in the city of Cotonou.

Benin is bordered by Niger, Nigeria, Togo, and Burkina Faso. The Gulf of Guinea lies to the south. Benin is mostly flat but has some hills and low mountains. It is hot and humid in the south. The north is drier.

Woodlands cover most of central Benin. Grasslands cover the north. Elephants, antelope, panthers, monkeys, crocodiles, and tropical birds live in the south.

There are more than 40 ethnic groups in Benin. The largest groups are the Fon, the Yoruba, and the Adjara. Most Beninese are Christians or follow traditional beliefs, including voodoo. About 20 percent of the people are Muslims. French is the official language, but most people speak local languages.

A traditional village stands in the hills of Benin.

Benin's economy is based on agriculture. Its main crops include cassava, yams, corn, cotton, and oil palm fruit. The Beninese also raise cattle, goats, sheep, pigs, and chickens. Trade is another important industry. Benin's main products are cotton yarn, food and beverages, and crude petroleum (oil).

In the early 1600s several kingdoms, including the large and powerful Dahomey kingdom, ruled what is now Benin. Dahomey became one of the largest suppliers of slaves to Europeans. France made Dahomey a colony in 1894.

Dahomey became independent in 1960. After years of political troubles, army officer Mathieu Kérékou seized power in 1972. In 1975 he changed the country's name to Benin. In the 1990s Benin got a more democratic government.

Bering Sea

The Bering Sea lies between Asia and North America in the far northern part of the Pacific Ocean. On the west the sea borders the part of Russia called Siberia. To the east is the U.S. state of Alaska. The Aleutian Islands stretch across the sea's southern boundary.

The Bering Sea is one of the coldest and most dangerous seas in the world. In winter, the temperature over northern and eastern parts of the sea may drop to -49°F (-45°C). Floating ice is common in the north. Ships normally sail in the sea only between May or June and October.

Fishing and fish-related industries are the main economic activities in the region. More than 300 species of fish are found in the Bering Sea. They include herring, cod, flounder, halibut, and pollock. Huge numbers of salmon from Alaska and Russia spend their adult lives in the sea. There are also many shellfish.

The islands in the Bering Sea are a breeding ground for sea otters and fur

Berlin

Population

(2006 estimate), city, 3,395,189; urban area, 4,200,072

Berlin is the capital of Germany, a country in central Europe. It is Germany's largest city. Berlin is also a center of education and culture. Two of Germany's leading universities are in the city. The Berlin Opera and Berlin Philharmonic Orchestra are world famous.

Economy

Trade and the development of technology are important to Berlin's economy.

The city is also a center of industry. Factories in Berlin make electronics, machinery, chemicals, cloth, and many other products.

History

Berlin was founded in the early 1200s. It was the capital of the German kingdom of Prussia for most of the 1700s and 1800s. The city later became the capital of Germany.

During World War II (1939–45) Berlin was nearly destroyed. The city was the site of heavy bombing and bloody fighting. More than 150,000 residents of Berlin died.

Germany lost the war to the countries known as the Allies. The Allies divided Germany into two countries: East Germany and West Germany. They also divided Berlin into two sections. East Berlin became the capital of East Germany. (The capital of West Germany was Bonn.) Different Allied powers created different types of government in East and West Germany. The Soviet Union brought Communism into East Germany and East Berlin. The other Allied powers made West Germany and West Berlin a democracy.

About 2.5 million people fled from East Berlin into West Berlin between 1949 and 1961. To prevent more people from leaving, East Germany built a wall through Berlin. The Berlin Wall was heavily guarded. It separated East Berlin from West Berlin for almost 30 years.

For many years the Brandenburg Gate, on the left, was part of a wall that divided East and West Berlin. Now it stands at the center of a reunited Berlin.

East Germany's Communist government collapsed in 1989. People began to tear down the Berlin Wall. In 1990 the two parts of Germany and Berlin were reunited. Berlin was again the capital of all of Germany.

Bermuda

Bermuda is a cluster of islands in the North Atlantic Ocean. There are seven main islands and about 170 small islands. The seven main islands form a shape that looks like a fishhook. Bermuda is a colony of Great Britain. The capital is Hamilton.

Bermuda is far from other land. The closest land is Cape Hatteras, North Carolina, which lies about 650 miles (1,050 kilometers) to the west. The largest island is Great Bermuda, which is

Did You Know?

In 1948–49 the United States and its allies brought food to Berlin in airplanes, after Soviet troops blocked the roads. This project was called the Berlin Airlift.

usually called Main Island. It is larger than all the other islands combined. Coral reefs surround the islands.

Bermuda's climate is mild and humid. Common plants include flowering shrubs and palm, pine, and mangrove trees. Some birds visit the islands every year as they migrate. Lizards and frogs are the only other wildlife.

More than half of the people of Bermuda are black. They are descendants of Africans that white settlers brought to the islands as slaves. There are also many British and some Portuguese. English and Portuguese are the main languages.

Bermuda's economy depends on services. Tourism and finance are the most important industries. Many insurance companies and other financial businesses have offices in Bermuda.

Bermuda was named for the Spanish explorer Juan de Bermúdez. He may have visited the islands in 1503. English settlers arrived in Bermuda in the early 1600s. Britain made Bermuda a colony in 1684.

Britain and, later, the United States set up military bases in Bermuda. By the late 20th century the bases had been shut down. However, Bermuda remained a British colony. In 1995 the people of the islands voted against independence from Britain.

Bern

Population
(2007
estimate), urban
area, 344,724

Bern is the capital of Switzerland, a country in central Europe. The Aare River loops through the older part of the city. Bern's name comes from the German word for "bear." Bears are a symbol of the city. They have been kept on display in Bern for hundreds of years.

Many people in the city work for the government or the University of Bern. Tourism is also important to the economy. Factories in Bern make milk chocolate, condensed milk, machinery, and scientific instruments.

Bern began in 1191 as a military post. According to legend, it was named for the first animal killed by its founder, Berthold V, in that year. It grew into a city and then into an independent state. Bern became part of Switzerland in 1353. From the 1300s to the 1700s Bern was very powerful. This power ended when the French invaded in 1798. French rule ended in 1803. Bern became the capital of Switzerland in 1848.

The Universal Postal Union, a group that sets rules for the flow of mail between countries, is based in Bern, Switzerland.

Berry

Berries are small, fleshy fruits that usually have many seeds. People and animals eat many types of berries.

A true berry is a single fruit that grows from one flower. Blueberries, cranberries, currants, and gooseberries are all true berries.

Botanists, or people who study plants, call many other fruits true berries. These fruits include grapes, tomatoes, dates, watermelons, and oranges.

Blackberries, strawberries, raspberries, and blueberries are all called berries. But scientists say that only one of them, the blueberry, is a true berry.

Most people call other fruits berries—for example, blackberries, raspberries, and strawberries. But these are not true berries. They are aggregate fruits, or groups of little fruits that grow from one flower. Mulberries are not true berries, either. They are multiple fruits, or fruits that grow from a bunch of flowers.

Bethune, Mary McLeod

Throughout her life Mary McLeod Bethune worked to improve the lives of African Americans. She served as an adviser to President Franklin Roosevelt on the problems of minority groups. She also led several African American organizations.

Mary McLeod was born on July 10, 1875, on a small farm near Mayesville, South Carolina. Her parents were former slaves. She was not able to go to school until 1885, when missionaries opened a school for black children. She went on to college in North Carolina and Illinois. In 1898 she married Albertus Bethune.

She taught school in the South and in 1904 opened a school for black girls in Daytona Beach, Florida. She later said she started the school with nothing more than “five little girls, a dollar and a half, and faith in God.” It later merged with a school for boys called Cookman Institute and became Bethune-Cookman College.

Bethune later entered public life. In 1936 Roosevelt appointed her to the National Youth Administration. The year before that she had founded the National Council of Negro Women. She also served as vice president of the National Association for the Advancement of Colored People (NAACP) from 1940 to 1955. She died on May 18, 1955.

Bhutan

The country of Bhutan lies in the high Himalayas of south-central Asia. The capital is Thimphu.

Bhutan is surrounded by China and India. In the north, snowcapped mountains rise to more than 24,000 feet (7,300 meters). Valleys cover central Bhutan. In the south are jungles and savannas.

Pine and oak trees grow on the mountains. In the summer, yaks graze in pastures on the mountain slopes. Wild animals include snow leopards, monkeys, and migrating birds.

The Bhutia, people with ancestors from the Tibet region of China, make up about half of the population. The Bhutia practice Buddhism, the official religion, and mainly speak Dzongkha, the official language. The Nepalese are the second largest group. They speak Nepali and practice Hinduism. The smallest group

A Buddhist monastery known as the Tiger's Nest sits high up on a cliffside in western Bhutan.

is the Sharchops, Buddhists from nearby Indian areas who probably lived in the region first.

Farming is the main occupation of Bhutan. Farmers raise cattle, pigs, goats, horses, and sheep. They grow corn, rice, potatoes, sugarcane, wheat, fruits, and vegetables. Logging and construction are also important to the economy.

People from Tibet likely settled in what is now Bhutan in the AD 800s. In the 1600s a Tibetan Buddhist priest became the first king of Bhutan. The country's kings kept Bhutan isolated from the rest of the world for hundreds of years. In the mid-1900s that began to change. The king at the time made changes to start to modernize the country. By 2008 Bhutan had a new constitution and an elected parliament for the first time.

Bible

The Bible is an important book to both Jews and Christians. However, the Bible of Judaism is different from the Bible of Christianity, even though they include some of the same writings. The books of the Bible were written by many different authors over many hundreds of years.

The Bible of Judaism

The Jewish Bible focuses on the religious experiences of the ancient nation of Israel. It was written from about 1200 BC to 100 BC, mostly in Hebrew. It contains 24 books divided into three sections: the Law, the Prophets, and the Writings.

Many early copies of the Bible were written by hand. They included colorful pictures. One such illustration shows a story from the book of Exodus. It tells how Moses helped free the Israelites by leading them from Egypt through the Red Sea.

The first five books are Genesis, Exodus, Leviticus, Numbers, and Deuteronomy. Together they are known as the Law because they explain and interpret God's laws. They also tell how ancient Israel became a nation and came to possess the promised land. These five books are sometimes called the Torah.

The books of the Prophets contain messages from the prophets—people of ancient Israel who spoke to the nation on behalf of God. These books also tell more about the history of ancient Israel.

The Writings section includes a variety of books that contain poetry, stories, history, and other types of literature. Among them is the Psalms, a collection of sacred songs and poems from various periods in the history of Israel. The other Writings use sayings and stories to teach people about proper behavior.

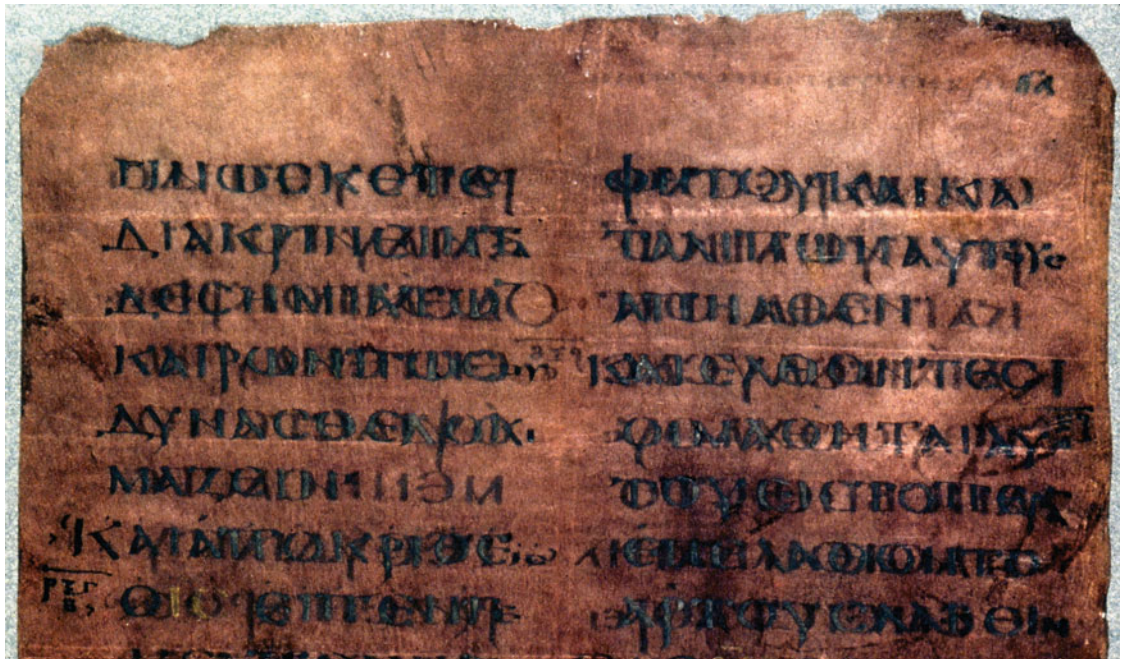

The Bible of Christianity

The Christian Bible is made up of two parts: the Old Testament and the New Testament. The Old Testament is very similar to the Jewish Bible, but the books are arranged and numbered differently.

Not all Christian Bibles are exactly alike. Besides the 39 books of the Christian Old Testament, Roman Catholic and Eastern Orthodox churches include some books that are not accepted by Protestants. These books are known as the Apocrypha. The Jewish Bible does not contain the Apocrypha either.

Did You Know?

The word Bible comes from a word in the Greek language that means "book."

The books of the New Testament were originally written in Greek. The Greek text can be seen on a page from a Bible made in the 500s.

Christians created the New Testament after Jesus' death to help spread the message about Jesus to the world. The New Testament is thought to have been written between about AD 50 and 150. The New Testament has four sections: the Gospels, the Acts of the Apostles, the Epistles (letters), and Revelation.

The four books called the Gospels tell about Jesus' life and teachings. Each book is believed to have been written by one of Jesus' closest followers: Matthew, Mark, Luke, and John.

The Acts of the Apostles tell about the early history of the church and its messengers (apostles) after Jesus' death.

The Epistles are letters of advice and instruction. Saint Paul wrote most of them. All the letters were later copied and spread among the churches in the

Roman Empire to give followers solutions to local church problems and instructions on how to live a Christian life. The letters also gave interpretations of the Gospels.

The Book of Revelation describes the end of the world and the events leading up to it. It sends a message of hope to Christians, reminding them to keep their faith through trying situations because the Kingdom of God is near.

Bicycle

A bicycle, or bike, is a machine for getting from place to place. Most bicycles

Safe bicyclists always wear helmets.

have two wheels set in a frame. The frame includes handlebars for steering, a seat, and two pedals. Millions of people throughout the world ride bicycles for fun, for exercise, for sport (called cycling), and for transportation.

How a Bicycle Works

To ride a bicycle, the rider sits on the seat and places the feet on the pedals. The pedals are connected by a chain to the back wheel. When the rider pushes on the pedals, the back wheel turns. This moves the bicycle forward. The rider steers by turning the handlebars or by leaning.

Bicycles may have coaster brakes or hand brakes. On a bicycle with coaster brakes, a rider stops by pedaling backward. Hand brakes are controlled using levers on the handlebars. When a rider squeezes the levers, pads squeeze against the wheels and the bicycle stops.

Some bicycles also have gears, or speeds. Shifting, or changing, gears lets the rider keep a steady pedaling speed when traveling on different surfaces. Higher gears

make pedaling harder but allow the bicycle to go faster. A rider may shift the bicycle into a higher gear when riding on smooth, flat ground. Lower gears make pedaling easier but slow down the bicycle. A rider may shift to a lower gear when riding up a hill.

Types of Bicycles

There are six main types of bicycles: utility, mountain, hybrid, touring, racing, and bicycle motocross (BMX). Utility bicycles have heavy frames and usually one speed. Mountain bikes have wide tires, flat handlebars, and many speeds. They are good for riding on rough trails. Hybrid bicycles are like mountain bikes, but their tires are not as wide. They are good for both roads and off-road trails. Touring and racing bicycles have narrow tires, lightweight frames, curved handlebars, and many speeds. They are often called road bikes because they are best for riding on roads. BMX bikes are designed for racing on dirt tracks. BMX bikes have a small

Two men ride an early form of bicycle called an ordinary, or a penny-farthing.

frame, a low seat, high handlebars, and one speed.

History

The first machines similar to bicycles were invented in the early 1800s. They had no pedals. Later machines had pedals and front wheels that were much larger than the back wheels. The front wheels were about 5 feet (1.5 meters) tall. By about 1900 bicycles looked similar to the bicycles of today.

Bill of Rights

A written statement that explains the basic freedoms and rights of citizens is generally called a bill of rights. In the

The U.S. Bill of Rights became law in 1791.

United States, the first 10 amendments to the Constitution are called the Bill of Rights.

History

For most of human history there was no thought given to the rights of individual citizens. The king or other ruler often had complete power over the people. This began to change in the late Middle Ages. The nobles of England forced King John in 1215 to guarantee them certain rights. The document he signed was called the Magna Carta, or Great Charter.

Many years later people in some countries tried to change their governments so that the governments would represent the people and not just the king. They often drew up a bill of rights. England produced a Bill of Rights in 1689, and the French Declaration of the Rights of Man (1789) stated the principles of the French Revolution.

United States Bill of Rights

The U.S. Constitution of 1787 set up a government that was subject to majority rule. However, many people wanted to protect individual rights and limit government power. They put statements such as the Virginia Declaration of Rights (1776) into state constitutions. Their demands led lawmakers to add 10 amendments to the Constitution in 1791. Among other things, those amendments guarantee freedom of religion, freedom of speech, and the right to public assembly. The rights granted by the Bill of Rights are not absolute.

Decisions by judges have expanded some rights and reduced others.

Other Documents

In 1948 the United Nations accepted the Universal Declaration of Human Rights as a standard for all countries. Governments and international organizations have used the declaration to judge how well human rights are observed around the world.

Bin Laden, Osama

Osama bin Laden is the leader of the terrorist group al-Qaeda. A terrorist is a person who tries to control people through violence and fear. Bin Laden and others founded al-Qaeda in the late

Osama bin Laden

1980s. Their goal was to protect the religion of Islam and Muslim people.

Early Life

Bin Laden was born in 1957 in Riyadh, Saudi Arabia. He grew up in a large and very rich family. He attended King Abdul Aziz University and became an engineer.

Organizing al-Qaeda

In 1979 troops from the Soviet Union invaded Afghanistan, a Muslim country. Bin Laden went to Afghanistan to help fight the invaders. It was during this period that he helped found al-Qaeda. He returned to Saudi Arabia as a hero.

Soon after he returned the Persian Gulf War broke out. The Saudi government allowed troops from the United States to establish a military base there. Bin Laden was angry with his government for letting the U.S. troops into the country. He was also angry with the U.S. government because he believed that it was interfering in the Muslim world. He moved to Sudan to set up training camps in 1994. He later moved to Afghanistan.

Attacks

Al-Qaeda carried out attacks worldwide throughout the 1990s. On September 11, 2001, members of al-Qaeda hijacked four airplanes. They crashed three of them into the World Trade Center in New York City and the Pentagon near Washington, D.C. The fourth airplane crashed in a field in Pennsylvania. About 3,000 people died in these attacks.

Did You Know?

Osama bin Laden had more than 50 brothers and sisters.

Afterward U.S. forces invaded Afghanistan to try to capture or to kill bin Laden.

Terrorism

Binoculars

Binoculars, like telescopes, magnify far-away objects to make them easier to see. To magnify is to make something look bigger. People use only one eye to look through a telescope, but they use both eyes to look through binoculars. Using both eyes makes faraway objects look more real.

How Binoculars Work

Most binoculars contain a series of lenses and prisms. Lenses are circles of curved glass. Prisms are pieces of glass with several flat sides. The lenses and prisms change the direction of the light going through them. The lenses and

A cutaway view shows how light passes through the lenses and prisms of binoculars.

Many people at a horse race use binoculars to get a better view.

prisms together change the image of the object being viewed.

When someone looks through a pair of binoculars light enters through a lens, called an objective lens, in each side. The objective lenses turn the image being viewed upside down. Then the light passes through the prisms. The prisms turn the image right side up and reflect it toward eyepieces. Finally, the light passes through the eyepieces into the eyes. The lenses in the eyepieces make the image look bigger. A ring located between the eyepieces lets the user adjust the focus of the binoculars. Focusing makes objects look clearer. The ring works by changing the distance between the eyepiece and the prisms.

How Binoculars Are Used

There are different strengths of binoculars. High-powered binoculars can make faraway objects look six, eight, or even 10 times bigger than they really are. Such binoculars are often used for watching birds and wild animals. Low-

powered binoculars can make objects look three times bigger. They are handy for watching a sporting event or a play or concert in a theater.

The size of the lenses is important, too. Larger lenses allow more light to enter the binoculars. This makes them work better at night or in dim light. However, larger lenses are also heavier. This makes the binoculars harder to carry and harder to hold steady. Smaller lenses might not be best for night viewing, but they are easy to hold and to carry.

Biology

Biology is the study of living things. A biologist is a scientist who studies biology. Biologists try to understand the natural world and the things that live in it. These things include plants, animals, fungi, protozoa, algae, bacteria, and viruses.

The study of biology covers many areas. It is usually divided into separate branches, or fields. Some biologists study anatomy, or the structure of living things. Some study physiology, or how the different parts of a body work together. Still others study ecology, or how organisms interact with their environment. There are many other branches as well.

In addition to these general fields, some branches of biology study certain types of living things. Some biologists study large groups, such as all animals (zoology) or all plants (botany). Others, however, only study specific groups, such as insects, birds, or mosses.

No one knows exactly when humans first began to study the natural world. Most biologists agree, however, that it was thousands of years ago. Many of today's ideas about biology started from the work of scientists who lived hundreds of years ago.

Did You Know?

During the 1900s, some of the biggest discoveries in biology had to do with a material called DNA. DNA is present in every cell of every living thing.

Biome

A biome is a large region of Earth that has a certain climate and certain types of living things. Major biomes include tundras, forests, grasslands, and deserts.

The plants and animals of each biome have traits that help them to survive in their particular biome. Plants and animals that live within smaller areas of a biome also depend on each other for

Biologists study an island gray fox on Santa Catalina Island near California.

Did You Know?

Not all deserts are hot. A cold desert covers part of Antarctica.

survival. These smaller areas are called ecosystems. Each biome has many ecosystems.

Tundras

The tundra biome is found in extreme northern regions. This biome has cold, dry conditions. The main plants include mosses, lichens, and short grasses. Arctic foxes, reindeer, and migrating birds are some common tundra animals.

Forests

Trees are the main plants in forest biomes. There are several different types of forest biome.

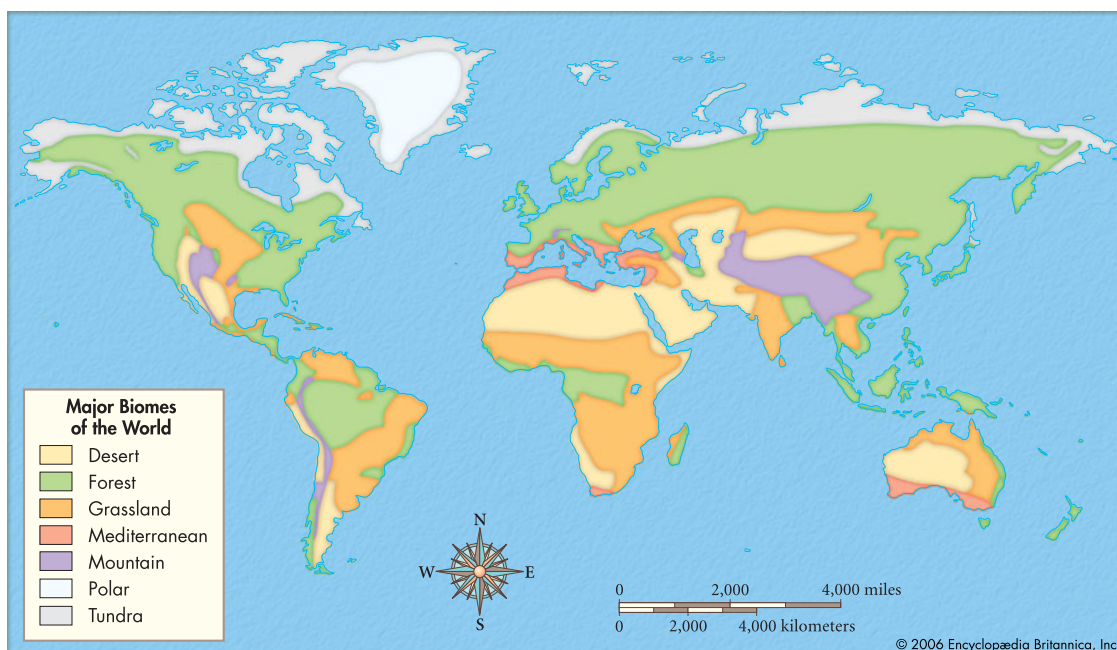

The taiga is a conifer forest biome. It lies just south of the tundra biome. The taiga has long, cold winters and short, mild summers. It gets more rain than tundras do, so it can support conifers. Conifers are trees with needles, such as spruces and firs. Lynx, timber wolves, moose, and beavers live in this biome.

Deciduous forests are found mainly in the Northern Hemisphere. This biome has cold winters and warm summers. The trees are deciduous, meaning that they shed their leaves in the fall. Deer, bears, bobcats, and squirrels are common to this biome.

Tropical rain forests lie near the equator. This biome has hot, wet conditions all year long. Tall, tropical trees and many other plants grow there. Monkeys, parrots, and anaconda snakes are some of the many rain forest animals.

Grasslands

Grassland biomes are places that get enough rain for grasses to grow but not enough to support forests. Temperate grasslands have hot summers and cold winters. Tropical grasslands, also known as savannas, are hot all year long. Prairie dogs and mule deer live in the temperate grasslands of North America. Giraffes, zebras, and lions live in the tropical grasslands of Africa.

Scientists in England created a humid tropical biome under a dome. It was part of a project to teach people about the relationships between plants and animals.

Deserts

Deserts are the driest biome. The largest desert, the Sahara, is in northern Africa. Deserts receive less than 10 inches (25 centimeters) of rain each year. Cacti and creosote bushes are two types of plant that can survive the dry conditions. Rattlesnakes, lizards, roadrunners, and owls are some of the animals of this biome.

Birch

The trees called birches have long been known for their beautiful bark. Native Americans used birch bark to make canoes, tepees, and moccasins. Today people use birch wood to make furniture, flooring, and plywood. Birches are also planted in parks and gardens.

Birch trees are found in the northern half of the world. They grow in areas with cool to cold weather.

There are about 60 species, or types, of birch. Some birches are shrubs, but most are trees. The monarch birch of Japan is one of the tallest birches. It grows to 100 feet (30 meters). Many birch trees in the United States are 40 to 70 feet (12 to 21 meters) tall. Birches have narrow trunks. Their bark is often white, and it has lines that go from side to side. Most young birch trees have bark that is easy to peel off.

Birch leaves are usually bright green. They turn golden yellow in the fall. Clusters of flowers grow on birches. They are called catkins. Some catkins look like miniature pinecones. These cones hold seeds. When the cone falls apart, the seeds scatter.

Birch trees are known for their white bark.

Birches can reproduce in several ways. Some birches grow from seeds. Others sprout from birch trunks or birch roots.

Bird

Many people keep parakeets or other birds as pets.

From pigeons in big cities to penguins in Antarctica, all birds have similar features. They all have wings, though they cannot all fly. All birds also have feathers. In fact, birds are the only living animals that have feathers.

Birds have fascinated people throughout history. Many people keep birds as pets or enjoy watching them in the wild or at zoos. In addition, farmers raise poultry for their meat and eggs. Hunters shoot some birds as game. People also use bird feathers in various products and for decoration.

Where Birds Live

Birds are found almost everywhere on Earth. There are more than 9,000 species, or types, alive today. Different types of bird have adapted to different habitats, from deserts to rain forests to icy lands to cities.

Many birds migrate, or fly long distances between their winter and summer homes. For example, many European birds travel to Africa for the winter. This helps them find enough food year-round.

Physical Features

Birds are warm-blooded. This means that their body temperature stays about the same, regardless of the temperature of their surroundings. Mammals, including humans, are also warm-blooded. However, birds are more closely related to the group of cold-blooded animals called reptiles than they are to mammals. In fact, many scientists think that birds developed from dinosaurs, which were reptiles, millions of years ago.

Size and Color

Birds vary greatly in size. The bee hummingbird is the smallest living bird. It is only about 2.5 inches (6.3 centimeters) long and weighs less than 0.1 ounce (3 grams). The largest living bird is the ostrich. Some male ostriches can stand 8 feet (2.5 meters) tall and weigh 300 pounds (135 kilograms).

Feather colors range from drab to very bright. In many species the male is more brightly colored than the female. The female's dull coloring may help it remain hidden in the nest. In some cases, the brightly colored male perches a short distance away from the nest. In this way, the male bird draws the attention of enemies to himself and away from the eggs and young. The male's

Did You Know?

There were no house sparrows, starlings, or domestic pigeons in North America before Europeans arrived. Settlers brought the birds from Europe.

Birds have different kinds of bills to help them eat different kinds of food.

showy coloring may also help it to attract a mate.

Flight and Basic Structure

Most birds can fly. They are able to do so because of their body structure and feathers. Flying birds are strong but light. Their powerful chest muscles help them flap their wings. Many of their bones are hollow, which keeps them light. Their compact bodies narrow toward the ends like jet airplanes. Air flows smoothly over their feathers while they fly.

However, a few types of bird cannot fly. Penguins have paddlelike wings that are useless for flying. But their wings help them swim well. Ostriches and similar flightless birds have small wings and weak chests. They walk or run everywhere on their strong legs. Most other kinds of bird can walk (or swim) and fly.

Every bird has two legs, two feet, and a bill. Many birds have a pouchlike area of the throat called the crop. The crop is used to store food. Many birds also have a gizzard, a part of the stomach that grinds up food. Birds lack teeth, so they cannot chew their food.

Feathers

Feathers help birds fly and protect them from water, heat, and cold. Birds rearrange and clean their feathers regularly. Most kinds also apply oil to the feathers from a gland near the tail. Water slides off the oiled feathers instead of soaking through. At least once a year birds shed

their old feathers and grow new ones. This process is called molting.

Senses

Birds have sharp eyesight. For instance, an American kestrel flying 100 feet (30 meters) above a field can spot a grasshopper on the ground below. However, birds generally have a narrower range of hearing than humans do. Their sense of smell is usually not highly developed.

Behavior and Feeding Habits

Some types of bird live alone most of the time. Other types are more social. They may feed, sleep, fly, and nest in groups called flocks.

Birds use many different sounds to communicate with one another. For example, some baby chicks stop moving when their mother produces a danger call. Birds may sing to attract mates. They may also sing to announce that a certain patch of land belongs to them.

Birds eat a wide variety of foods. Many types eat insects. Some waterbirds catch fish. Birds of prey catch many kinds of animals, including other birds. Some birds, such as vultures, feed on dead animals and garbage. Many other types eat plant material, such as seeds and fruits.

Reproduction

Most birds breed at least once a year. Many types build nests for their eggs. A nest can range from a scrape in the sand to a cup of twigs and mud to a complex

An American robin brings a worm to its hungry young.

hanging basket. The female bird lays a set of anywhere from 1 to 20 eggs, depending on the species.

Most birds sit on their eggs to keep them warm. This process is called incubation. The eggs hatch into young birds in about 11 to 80 days, depending on the species. Some young birds can feed themselves almost immediately. Other types depend on their parents to provide their food for a time.

• Migration, Animal • Pet • Poultry

Bird, Flightless

Millions of years ago, all birds could fly. But as time passed, some birds became flightless. That is, they lost the ability to fly, though they still have wings.

Why Some Birds Do Not Fly

Scientists do not agree on how some birds became flightless. One idea has to do with where the birds lived. The first flightless birds may have appeared in isolated places, or places cut off from the rest of the world. Birds living in these isolated spots, like islands, found no enemies. For that reason, they did not need to fly to stay alive. So, as these birds evolved, or developed over thousands of years, they gradually lost their ability to fly.

Flightless Birds Today

The largest flightless birds are the ostriches of Africa. Rheas, emus, and cassowaries are other large flightless birds. Rheas live in South America, emus live in Australia, and cassowaries live in Australia and New Guinea. All these birds are about 5 feet (1.5 meters) tall and have very strong legs.

Kiwis and penguins are two kinds of smaller flightless birds. Kiwis are about the size of a chicken. They live in New Zealand. Penguins can be up to about

The flightless kiwi lives in New Zealand.

3.5 feet (1 meter) tall. They live mainly in Antarctica.

Extinct Flightless Birds

Some flightless birds are extinct, or completely wiped out. Huge elephant birds lived on the island of Madagascar, off the east coast of Africa. These birds sometimes reached a height of 10 feet (3 meters) and a weight of about 1,000 pounds (450 kilograms). Elephant birds disappeared within the last 1,000 years.

Moas lived on the islands of New Zealand. In about AD 1250 people arrived and began to hunt them for food. Moas died out by about 1350.

Dodos lived on Mauritius, an island in the Indian Ocean. Sailors arrived in about 1507 and began to hunt dodos. The flightless birds made their nests on the ground, so their eggs were unprotected, too. Pigs and rats, which came with the people, easily found the eggs and ate them. Dodos became extinct by about 1690.

Bird • Ostrich • Penguin

Two young emus graze in a field with an adult.

Bird of Prey

Several kinds of bird that eat animals are known as birds of prey. Some common birds of prey include eagles, falcons, hawks, ospreys, owls, buzzards, and vultures. Birds of prey are found all over the world. They are sometimes called raptors.

Birds of prey are usually large and strong. Most are excellent hunters. Their good eyesight helps them see prey from far away. Most of the birds have hooked beaks and sharp claws that are useful for holding and killing prey. Most birds of prey feed during the day and sleep at night. Owls, however, hunt at night and sleep during the day.

Birds of prey eat a great variety of animals. Some kinds eat other birds. Some eat insects, fish, rodents, snakes, frogs, or other animals. A few kinds look for animals that are already dead to eat. Vultures, for instance, hardly ever hunt live animals.

The common buzzard uses its claws to grasp prey and its beak to tear flesh.

A screech owl holds a frog it has just caught.

Many birds of prey keep the same mate for their whole lives. Most kinds build nests in trees, on ledges of cliffs, or on the ground. They usually lay one to four eggs. Owls, however, may lay up to 12 eggs at a time. Most eggs are white or greenish in color and have spots.

Birds of prey are helpful to people because they eat dead animals and kill rodents and other pests. But some people kill the birds. They fear the birds will eat their livestock. And over the years people have cut down many trees. This has limited the areas where the birds can live and find food. Chemicals that people use to kill pests have also harmed birds of prey. Several kinds are in danger of dying out, or becoming extinct.

North Dakota

Bison

Bison are the largest land mammals in North America and Europe. There are two species, or types, of bison: the American bison and the European bison. The animal commonly called the American buffalo is actually the American bison. It is also called the plains bison. The European bison is also called the wisent. The true buffalo are a different group of animals found in Africa and Asia. Bison are closely related to buffalo, cattle, and yaks.

Where Bison Live

Both types of bison once existed in much greater numbers. Tens of millions of American bison roamed the western plains in what are now Canada and the United States. They were important animals to the Plains Indians. The European bison once lived throughout most of Europe. Over time settlers and hunters killed millions of both types of bison. By the early 1900s both species were

American, or plains, bison

A herd of bison runs through a state park in South Dakota.

endangered, or in danger of dying out. Since then people have worked to save these animals.

Today the American bison is found mainly in protected areas such as national parks. It is no longer endangered. Small numbers of European bison can be found in parts of eastern Europe, especially Poland, Belarus, Ukraine, and Russia. It is still an endangered species.

Physical Features

Bison are large, powerful animals. An adult male American bison stands about 6.5 feet (2 meters) tall at the shoulder. It may weigh about 2,000 pounds (900 kilograms). The females are smaller. The European bison is slightly larger than the American bison but is not as heavily built.

Bison have huge heads and a hump at the shoulders. Two short horns curve upward. They have hooves on all four feet. Bison have shaggy brown fur. The fur is usually longer on the head, neck, and shoulders.

Behavior

Bison eat mainly grasses. They usually move with a plodding walk. But they can also run at speeds of about 40 miles per hour (65 kilometers per hour). Bison usually live in small groups. Sometimes dozens or even hundreds of groups come together to form large herds.

Bivalve

Bivalves are animals that have a shell with two halves called valves. The word bivalve means "two valves." Bivalves are part of a larger group called mollusks. Mollusks are a type of animal with a soft body.

There are about 8,000 species, or kinds, of bivalve. They include scallops, cockles, clams, oysters, and mussels. Most bivalves live in the ocean, but a few species live in freshwater.

Physical Features

Bivalves vary greatly in size, shape, and color. Tiny freshwater shells may be only 0.06 inch (1.5 millimeters) long. Giant clams in the southern Pacific Ocean may be more than 4 feet (1.2 meters) long

Scallops are a type of bivalve. Most kinds of scallop shells are shaped like fans.

and weigh more than 500 pounds (225 kilograms).

A bivalve's shell protects its soft body. Muscles connect the two valves of the shell on one side. These muscles allow the shell to close quickly and tightly. When a bivalve relaxes the muscles, the shell opens.

A bivalve's body includes a nervous system, a digestive system, and a heart. Bivalves have gills instead of lungs. When a bivalve opens its shell, water washes over the gills. The gills then strain out oxygen and food particles.

Behavior

Different bivalve species live in different ways. Oysters and ocean mussels spend their lives attached to solid, underwater surfaces, such as rocks on the ocean floor. Some bivalves, such as scallops, swim by clapping their valves together. This pushes water out of the shell and moves them forward. Clams and freshwater mussels move around with a muscular "foot." The foot is shaped like a blade. These bivalves escape enemies by using it to dig into sand.

Uses

Bivalves are an important source of food for fish, birds, and people. People also make jewelry and crafts out of the shells. The shiny material of some shells, called mother-of-pearl, can be made into buttons or other decorations. Some bivalves build shiny round beads around particles of dirt that enter their shells.

People make jewelry out of these beads, which are called pearls.

Black Americans

► see African Americans.

Blackbird

There are many species, or types, of blackbird—songbirds named for the black color of the males' feathers. The Old World, or common, blackbird is related to thrushes, robins, and bluebirds. All other types of blackbird are in the same scientific family with grackles, cowbirds, orioles, and meadowlarks. The best-known types are the red-winged blackbird and the yellow-headed blackbird. Although crows and ravens also have black feathers, those birds are not called blackbirds.

The red-winged blackbird is found in North America and Central America.

Did You Know?

Early humans used scallop shells as dishes.

The Old World blackbird lives in woods and gardens in Europe, Asia, New Zealand, and Australia. Most types of blackbird, however, are found in North America. They live in marshes, fields, prairies, woods, and towns.

Blackbirds generally range from about 8 to 11 inches (20 to 28 centimeters) in length. Among Old World blackbirds the males are black and the females are brown. This is true of many blackbirds. Often the males also have some brightly colored or dark, glossy feathers. The male red-winged blackbird has yellow and red feathers on its shoulders. The female is brown and streaky like a sparrow. The male yellow-headed blackbird has a bright yellow head and a black body. The female has a dull yellow head and a gray-brown body.

Most blackbirds eat mainly insects and grains and other seeds. They often look for food on the ground in large groups. The Old World blackbird eats insects, worms, and fruits.

Blackfoot

The Blackfoot (also called Blackfeet) are a group of three Native American tribes—the Piegan, the Blood, and the Blackfoot proper (also called Northern Blackfoot). The Blackfoot were most powerful in the early 1800s. At that time they controlled a large area of land in the United States and Canada from Montana to Alberta and Saskatchewan.

Children from the Blackfoot tribe wear colorful traditional clothing.

The Blackfoot got most of their food by hunting bison (buffalo). They lived in portable cone-shaped tepees made from a wooden frame covered with bison hides.

European traders arrived in the Blackfoot's territory in the late 1700s. The Indians were friendly to these newcomers until 1806, when the Lewis and Clark Expedition killed two of their warriors. Afterward the Blackfoot considered Americans to be their enemies, and they attacked traders, miners, and settlers.

The Blackfoot suffered from diseases such as smallpox that were introduced by the Europeans. Non-Indians also killed nearly all the bison of the Plains. This left the Blackfoot without their most important source of food.

Unable to live as bison hunters, the Blackfoot agreed to move to reservations. By the end of the 20th century, about 32,000 Blackfoot lived in the United States, mostly in Montana.

Another 12,000 lived in Canada, primarily in Alberta.

Black Hawk

Chief Black Hawk led his people, the Sauk tribe, in a fight against white settlers.

A chief of the Sauk people, Black Hawk led a band of 1,000 Native Americans who refused to be forced from their homeland by white settlers. In 1832 their struggle sparked the brief Black Hawk War.

Black Hawk was born in 1767 near the mouth of the Rock River in what is now the U.S. state of Illinois. His Indian name was Ma-ka-tai-me-she-kia-kiak. Black Hawk resented the coming of American settlers and fought with the British against the United States in the War of 1812.

While Black Hawk was away, Keokuk became leader of the Sauk. Keokuk was friendly with U.S. officials. His followers agreed to move across the Mississippi River into what is now Iowa. Black Hawk and his followers resisted, but they were forced to move to Iowa in 1831. The next spring, however, they returned to their homeland. President Andrew Jackson then sent troops.

Black Hawk did not get the help he needed from other tribes. The U.S. troops drove his band north into what is now Wisconsin. In the final battle of the Black Hawk War, the troops killed most of the Indians at the Bad Axe River. Black Hawk survived and was sent to prison. In 1833 he was allowed to return to Iowa. He died there in 1838.

Black Hills

The Black Hills of the west-central United States are abundant in natural beauty. The hills were home to Native

Mount Rushmore National Memorial rises above the forested slopes of the Black Hills.

Americans until the area became the center of a gold rush in the late 1800s. Today they attract millions of visitors from all over the world.

The Black Hills lie largely within the Black Hills National Forest of western South Dakota and northeastern Wyoming. From a distance their rounded hilltops and heavily forested slopes look dark, which is why they are named the Black Hills. The hills rise approximately 3,000 feet (900 meters) above the surrounding Great Plains.

The Black Hills contain many tourist attractions. Mount Rushmore National Memorial in South Dakota features huge carvings of Presidents George Washington, Thomas Jefferson, Abraham Lincoln, and Theodore Roosevelt. South Dakota's Custer State Park is home to a large herd of roaming bison. Other attractions in South Dakota include Jewel Cave National Monument, Wind Cave National Park, and the old mining town of Deadwood.

Devils Tower National Monument is in Wyoming.

The Black Hills were once a hunting ground and sacred territory of the Sioux Indians. A treaty signed in 1868 gave the Sioux rights to the region. However, white miners rushed into the hills after gold was discovered in 1874. In 1876 the Indians fought U.S. troops in the Black Hills War. After being defeated, the Indians were forced to leave the hills.

Black Hole

A black hole is an area in space with an incredibly strong force called gravity. This gravity pulls in everything that gets close. Nothing, not even light, can

A picture from the Hubble Space Telescope shows a huge ring of gas and dust in space. Scientists think the ring may surround a black hole.

escape from a black hole once it has been pulled in.

Black holes are not actually holes. They have great amounts of material packed in very tightly. They are remarkably heavy for their size. This gives black holes their strong inward pull. They are called “black” because they are invisible. That is because no light can bounce off a black hole. All the light that gets near one is trapped inside.

Finding a Black Hole

Because no one can see black holes, they are hard to find. Scientists detect black holes by noting their effects on objects nearby. For example, just before material enters a black hole, it gives off many waves of energy called X-rays. Scientists can detect those X-rays.

How Black Holes Form

A black hole can be formed when a huge star uses up its fuel. A star is normally a huge ball of a gas called hydrogen, which serves as fuel for the star. The star constantly changes the hydrogen into other gases and in the process makes energy. The energy pushes outward. At the same time, the star’s gravity pulls inward. This balance of pushing and pulling keeps the star about the same size. However, when a star runs out of hydrogen, it cannot make the energy that pushes outward. Gravity continues to pull the star in on itself. If the star is very large, its gravity is very strong. The gravity crushes the star smaller and smaller, and it becomes a black hole.

Scientists think that black holes can also be formed in other ways, but they do not know for certain how this happens. They believe that a huge black hole lies at the center of nearly every galaxy, or group of stars, gases, and dust.

Black Sea

The Black Sea lies in the southeastern part of Europe. It is roughly oval in shape. Though far inland, it connects with the Atlantic Ocean through a series of other waterways. The Bosphorus Strait, the Sea of Marmara, and the Dardanelles Strait link the Black Sea to the Aegean Sea, the Mediterranean Sea, and finally, the Atlantic.

The Black Sea is located where Europe and Asia meet. It is bordered by Ukraine to the north, Russia to the northeast, Georgia to the east, Turkey to the south, and Bulgaria and Romania to the west. Several great rivers empty into the Black Sea. These include the Danube, Dniester, Bug, Dnieper, Don, and Kuban. The

The ruins of an old fort lie near the Black Sea in Turkey.

Crimean Peninsula juts into the Black Sea from the north. The sea covers about 163,000 square miles (422,000 square kilometers).

The Black Sea is important for transportation year-round. It is the starting point for the shipment of goods from eastern Europe to the rest of the world. The magnificent climate and mineral springs around the Black Sea have made it a major health and vacation center. The Crimea is the most popular region for visitors.

Blackwell, Elizabeth

Elizabeth Blackwell was the first woman to become a doctor in the United States. During Blackwell's life few people would accept the idea of a woman doc-

tor. As a result Blackwell had to struggle all her life to practice medicine.

Early Life

Elizabeth Blackwell was born on February 3, 1821, in Bristol, England. Her family moved to the United States when she was 11 years old. When she was about 24 years old she decided she wanted to become a doctor.

Blackwell applied to many medical colleges, but none of them would allow a woman to study there. Finally, in 1847, Blackwell was accepted by Geneva Medical College in Geneva, New York. She graduated two years later at the top of her class. Blackwell then traveled to Paris, France, where she worked at a hospital for women. She continued her medical studies in England.

Career

In 1851 Blackwell traveled back to the United States, but no hospital would

Elizabeth Blackwell

hire her. She started a small clinic for the poor in New York City. In 1857 the clinic became the New York Infirmary for Women and Children. In 1868 Blackwell opened the Woman's Medical College at the New York Infirmary.

In 1869 Blackwell moved to England. She helped to set up the National Health Society. She also served as a professor at the London School of Medicine for Women from 1875 to 1907. Blackwell died in England on May 31, 1910.

Blindness

People who are not able to see have a condition called blindness. Blindness can affect one or both eyes. Some blind people have no sight at all. Others can see light and shadows or blurry shapes.

Color blindness is a different kind of condition. Color-blind people have trouble telling colors apart. Some can see no color at all. Color blindness is inherited, or passed on from one generation to another.

Causes

Sometimes blindness is inherited. An injury to the eyes or the brain may also cause blindness. However, a number of diseases and disorders are the main

causes of blindness. These include cataracts, glaucoma, macular degeneration, and diabetes mellitus.

A cataract is the clouding of the lens of an eye. Glaucoma is a disease that can damage the optic nerve, which connects the eye to the brain. Macular degeneration is a disease that damages the retina, or the lining of the eye. Diabetes mellitus is a disease of the body that can also damage the retina. All these problems cause blindness mainly in older people.

Prevention and Treatment

Proper medical care can prevent or cure some common types of blindness. For example, doctors can treat glaucoma with special eye drops or surgery. Doctors can use surgery to treat cataracts, too. They remove the clouded lenses and replace them with artificial (man-made) lenses.

A blind mountain climber crosses a temporary bridge on the way to the top of Mount Everest.

Did You Know?

A disease called river blindness is a serious problem in parts of Africa. It is caused by a small worm that is spread to humans by the bite of the black fly.

Sometimes blindness cannot be prevented or treated. Nevertheless, many blind people are able to live on their own. Some have specially trained guide dogs that help them to get around. Many can read books and signs that are printed in Braille. This is a code of raised dots that people read with their fingers.

Blood

In humans and many other animals, blood is a liquid that carries nutrients and removes waste. Blood moves through the body's cardiovascular system. This includes the heart and a vast network of blood vessels. The heart pumps blood through the blood vessels to all parts of the body.

Structure

Blood cells make up about half the volume (amount) of blood. These cells form inside bone marrow, which is a soft

Blood is an important part of the body, but people can lose a small amount of their blood and feel fine. Doctors can examine a patient's blood to tell if they have a particular disease. People can also give some of their blood to others who may need extra blood.

tissue inside bones. There are three main types of blood cell: red cells, white cells, and platelets.

Red blood cells are the most numerous kind of blood cell. Their main job is to transport oxygen. In each cell, an iron-rich substance called hemoglobin carries the oxygen. Hemoglobin and oxygen together give blood its red color.

White blood cells, or leukocytes, help to keep the body healthy. Some swallow up tiny living things called bacteria or other foreign substances. Others release proteins that attack invading substances. Still others help to break down and remove dead cells.

Platelets are the smallest of the blood cells. They are able to stick to one another and form blood clots. Clots plug holes that may develop in the walls of blood vessels. This helps to stop bleeding.

The watery part of the blood is the plasma. Most of the plasma is water. Plasma also contains nutrients, chemicals, hormones, and wastes.

Functions

As blood passes through the lungs it picks up oxygen. The oxygen-rich blood then travels throughout the body. The body's cells take in this oxygen. In exchange, they send a gas called carbon dioxide into the blood. The blood carries the carbon dioxide back to the lungs, which push the gas out of the body.

Blood is made up of red blood cells, white blood cells, platelets, and plasma.

Blood also carries nutrients (proteins, fats, sugars, salts, vitamins, and minerals) to the body's cells. It takes away various wastes made by the cells. The kidneys, spleen, and liver clear the blood of wastes.

Blueberry

Blueberries are small, dark blue fruits that grow on bushes. They have a mildly tart taste. Blueberries are eaten fresh or used to make bakery goods and jams. They contain vitamin C, vitamin A, and iron.

Blueberry bushes are found in woods and hilly areas of North America, Great Britain, northern Europe, and Asia. In the United States blueberries are grown in Maine, New Jersey, Michigan, and North Carolina.

Blueberry bushes produce flowers in the spring. Each flower develops into a single berry. For this reason botanists (people who study plants) consider blueberries to be true berries. Cranberries are also true berries. Some other berries, such as strawberries and raspberries, are actually clusters of small fruits that grow from a single flower.

Blueberry bushes tend to produce too much fruit. This limits the size of the fruit. It also increases the time that it takes the fruit to grow to full size. Growers remove some flower buds from blueberry bushes to allow larger berries to

Bluebird

Bluebirds are songbirds named for the males' bright blue feathers. The soft whistles of their song are among the

The western bluebird is one of three types of bluebird.

earliest sounds of spring in North America. Bluebirds belong to the thrush family. This means that they are related to thrushes, robins, and nightingales. There are three species, or types, of bluebird: the eastern bluebird, the western bluebird, and the mountain bluebird.

Bluebirds are found in fields, orchards, parks, and gardens. Eastern bluebirds live in eastern Canada and the eastern United States. The western and mountain types are found in western Canada and the western United States. Many bluebirds avoid cold winters by flying south for the winter. Some of the birds fly as far south as Mexico.

Most bluebirds are about 7 inches (18 centimeters) long. The males are mostly blue, while the females are mostly bluish gray. The male eastern and western types have rusty-red-colored breasts. The females of those types have dull orange breasts. Bluebirds have slender bills, which they use to eat insects and fruit.

Bluebirds build their nests in holes, such as in trees, fence posts, or nest boxes that people make. The female lays four to six eggs at a time.

Blue Ridge Mountains

The Blue Ridge Mountains are a segment of the Appalachian Mountains in

the United States. They extend from Pennsylvania through parts of Maryland, Virginia, North Carolina, and South Carolina to Mount Oglethorpe in Georgia. The range is quite narrow, only 5 to 65 miles (8 kilometers to 105 kilometers) wide, and has average heights between 2,000 and 4,000 feet (600 to 1,200 meters). The range includes the Black, Great Smoky, and Unaka mountains.

The Blue Ridge spreads through several national forests. The Shenandoah National Park in northern Virginia and the Great Smoky Mountains National Park also lie in the Blue Ridge. The Blue Ridge Parkway is a scenic highway established in 1936 that extends through the Appalachian Mountains in Virginia and North Carolina. It covers 142 square miles (368 square kilometers).

The Blue Ridge region is rather isolated. Many people in this area work in tobacco production, cattle raising, and truck farming. The forests in the ridge are a rich source of timber. The

The Blue Ridge Mountains are covered with forests in most places. A haze that often hangs over the forests gives the mountains their blue color.

Blue Ridge region is known to have more than 700 varieties of trees and plants.

Blues

The blues is a type of American music that became popular in the early 1900s. It is closely related to jazz. Instrumental music is important in the blues. Guitar, piano, and harmonica are typical blues instruments. But singing plays the key role in many songs. Rather than simply tell a story, blues singers express their feelings. These feelings are often sad.

Often the blues singer sings the first part of a line of music. The instruments then repeat or “answer” the part the singer sang. Blues performers make up parts of the music while performing it, within certain rules. This is known as improvisation.

The blues developed from the folk music of black people in the American South. That music included songs that blacks sang while working in the fields during the time of slavery. Later, in the early 1900s, the black bandleader W.C. Handy wrote blues songs that helped make the style popular. In the 1920s black singers such as Mamie Smith, Ma Rainey, and Bessie Smith made the first blues recordings.

In the first half of the 1900s many blacks moved from country areas in the South to cities in the North. They brought the blues with them. Musicians in Chicago played the biggest role in developing urban, or city, blues.

Famous blues performers include Riley “B.B.” King, John Lee Hooker, Muddy Waters, and Buddy Guy. Blues music has greatly influenced several other musical styles, including jazz, rock, and soul.

B.B. King is a well-known blues guitarist and singer.

Blume, Judy

Judy Blume

The U.S. author Judy Blume writes popular books for children and young adults. Her books are read all over the world. They have been published in more than 20 languages.

Blume was born on February 12, 1938, in Elizabeth, New Jersey. Her name was originally Judy Sussman. Blume was her first husband's last name. In 1961 she graduated from New York University with a degree in education. Her first book, *The One in the Middle Is the Green Kangaroo*, was published in 1969.

Blume's books contain language, situations, and concerns that feel real to kids. Her books talk about adolescence in an honest, understandable way. Blume became famous when her novel *Are You There God? It's Me, Margaret* was published in 1970. Blume used her own memories of growing up to write the book.

Many young readers liked how Blume wrote realistically about their concerns. However, some adults thought that

Blume's books were too direct in their discussion of sensitive subjects. They did not want the books to be available to children. Some people tried to have Blume's books removed from schools and libraries.

Blume's experiences led her to speak out against the banning of books. Blume also started the Kids Fund, which encourages parents and children to talk openly with each other.

Boa Constrictor

The boa constrictor is a large nonpoisonous snake. It kills its prey by coiling around it so tightly that the animal cannot breathe. Despite this deadly strength, the boa constrictor has become a popular pet. These snakes normally have mild tempers. They belong to the boa family, along with anacondas, tree boas, and many other types of snake.

Boa constrictors can be found in Central and South America. They live in a vari-

A boa constrictor coils around a tree branch.

ety of habitats, including tropical rain forests, grasslands, and drier areas.

Boa constrictors have thick, muscular bodies. Most of them grow to about 10 feet (3 meters) in length. But some South American boa constrictors have grown to more than 18 feet (5.5 meters). Most boa constrictors have brown and gray bodies with brown, black, and white markings. Some boa constrictors have silver or red bodies.

During the day the boa constrictor rests in tree hollows, old logs, and animal homes called burrows. At night it hunts a wide variety of birds, reptiles, and mammals. It hunts most animals on the ground. But it moves up into trees to hunt birds and bats.

Most types of snake hatch from eggs laid by the female. However, the eggs of boa constrictors develop inside the female's body. The female gives birth to live babies, often 25 or more at a time. The baby snakes measure from 1 to 2 feet (0.3 to 0.6 meter) long.

Boat

For thousands of years people have used boats to move goods and people across water. Today the word boat means a small watercraft used for fun or for carrying small loads. Larger boats that carry many people or tons of goods over long distances are called ships.

There are many different kinds of boats, but most have the same basic parts.

Parts of a Boat

Most boats have several common parts. The hull is the body, or frame, of the boat. The walls of the boat are called bulkheads. The deck is the floor of the boat. Underneath the boat are the keel and the rudder. The keel runs from the front to the back of the boat. It sticks into the water to keep the boat from tipping over sideways. The rudder is attached to the back of the boat. It helps to steer the boat.

The sections of boats also have special names. The front of the boat is called the bow. The back is called the stern. The left side of the boat is called port. The right side is called starboard.

Types of Boats

Boats come in many different sizes and types. In general they can be grouped

Five common types of boat are the rowboat, the sailboat, the motorboat, the raft, and the canoe.

into three main categories. These are based on the type of power needed to move them through the water.

Many boats need the effort of human muscles to move them. These include canoes and kayaks, which are small, lightweight boats with pointed ends. People use paddles to move canoes and kayaks forward. Rowboats are wider and heavier than canoes. People move rowboats forward with oars.

Sailboats are boats with sails, or large pieces of cloth, raised on posts called masts. Sails catch the wind, which pushes the sailboat along. Sailboats range in size from small, one-person boats to huge sailing ships that can cross oceans.

A motorboat is any boat that is powered by a motor. Engines can be

inboard or outboard. An inboard engine is permanently mounted inside the boat's hull. An outboard engine is clamped to the outside of the hull and can be removed easily. Both types usually move the boat by turning a propeller in the water.

Uses

Boats can be used for pleasure, for sport, or for work. Many people enjoy taking a canoe or kayak out on a river or a sailboat out on a lake for fun. Others like to race boats. Very narrow rowboats called shells or sculls are used in the sport of racing. Several categories of rowing are events in the Olympic Games. Sailboats and motorboats are also used for racing. The most famous international sailing competition is the America's Cup race. Boats used for work include fishing boats and tugboats.

History

Ancient peoples used boats as many as 10,000 years ago. Some of the earliest boats were simple rafts made out of bunches of reeds or logs tied together. Ancient peoples around the world made dugouts, or canoes carved out of logs. Native American and Inuit peoples made canoes out of bark or animal hides. People later built boats out of wooden planks. They added masts and sails, and later engines, for speed. Modern boats are often made of metal, fiberglass, or plastic.

Ship

Bog

A bog is a kind of wetland with wet, spongy soil. Bogs differ from marshes and swamps because their soil contains almost no minerals. That is because their main source of water is rainwater, which contains few minerals. In contrast, marshes and swamps have mineral-rich soil.

Bogs generally form in places where glaciers once dug into the Earth's surface. The glaciers left holes that filled with water and eventually formed bogs. A bog begins to form as a lake is covered with a floating layer of plants. As the layer thickens, pieces of the plants sink to the bottom. The plants eventually fill the lake and create a bog.

Plant life is limited in a bog because of the lack of minerals in the soil. Mosses and heaths are the main plants. Layers of

The Irish countryside features large areas of peat bogs.

dead plants build up in bogs to form a material called peat. Dried peat is burned for fuel. Animals are not common in bogs.

miners. It grew into the city of Boise. Today tourists visit the empty old mines and mining towns, called ghost towns, near Boise.

In 1864 Boise became the capital of the Idaho Territory. It remained the capital when Idaho became a U.S. state in 1890.

Bolívar, Simón

Known as the Liberator, Simón Bolívar led revolutions against Spanish rule in South America. The countries of Venezuela, Colombia, Ecuador, Panama, Peru, and Bolivia all owe their independence largely to him.

Bolívar was born on July 24, 1783, in Caracas, New Granada (now in Venezuela). After studying in Europe, he returned to South America and began to fight Spanish rule. Between 1810 and 1814 Venezuela made two failed tries to

Simón Bolívar

break free from Spain. After the second defeat, Bolívar fled to Jamaica and then Haiti.

In 1819 Bolívar made a daring attack on the Spanish in New Granada. That colony included the territory of modern Venezuela, Colombia, Ecuador, and Panama. In August 1819 Bolívar's men defeated a much larger Spanish army. Then he announced that New Granada had become a new republic called Gran Colombia. He was its president. By 1822 all of Gran Colombia was free from Spain.

Bolívar next went to Peru. There he continued the work of José de San Martín. Martín had earlier begun a fight for independence. In 1824 his forces defeated the Spanish there. In the next year one of Bolívar's officers freed Upper Peru, the last part of South America under Spanish rule. To honor Bolívar, its name was changed to Bolivia.

At the height of his power, between 1825 and 1828, Bolívar ruled Gran Colombia, Peru, and Bolivia. He wanted the new countries to be allies, but they started fighting among themselves. Venezuela broke away from Gran Colombia in 1829, and Ecuador left in 1830. Deeply disappointed, Bolívar resigned as president. He died near Santa Marta, Colombia, on December 17, 1830.

Did You Know?

Venezuela named its unit of money the bolívar to honor Simón Bolívar.

Bolivia

A country in South America, Bolivia has breathtaking scenery, including deserts, jungles, and snow-covered peaks. Bolivia's culture blends American Indian and Spanish influences. Its judicial, or legal, capital is Sucre. However, the president and the legislature are based in La Paz.

Geography

Bolivia is bordered by Brazil, Paraguay, Argentina, Chile, and Peru. In the west the Andes Mountains stretch from north to south in two parallel ranges. The cool, dry Altiplano (High Plateau) lies between the two ranges. Tropical lowlands cover the east. Amazon rain forest covers the far north. The Bolivian Chaco region in the south is swampy in the rainy season but hot and desertlike for the rest of the year.

Plants and Animals

Coarse grass is common in the northern Altiplano, but much of that region is bare. Heavy forests of pines, laurels, and

Aymara Indian women take part in a festival in La Paz.

cedars cover the mountain slopes. Grasses, shrubs, and small trees that do not need a lot of water grow in the south. Mahogany and rubber trees grow in the northern rain forests.

The wildlife in Bolivia includes members of the camel family—llamas, alpacas, guanacos, and vicuñas. The Andean condor roosts in the mountains. In the northern forests are jaguars, sloths, monkeys, and tapirs. Parrots and toucans also live in the rain forests.

People

About 65 percent of Bolivians are American Indians, including the Aymara and the Quechua peoples. The Quechua are descendants of the Inca. About 30 percent of the population is mestizo, a mixture of Indian and European. The rest of the people are white, mainly descendants of Spanish conquerors. Aymara, Quechua, and Spanish are

Llamas stand on the shore of a lake in southwestern Bolivia.

Bolivia's official languages. Roman Catholicism is the main religion. More than half of the people live in cities.

Economy

Bolivia is one of the poorest countries in South America. However, it has large amounts of natural gas and is a major producer of zinc and tin. Most of the people work in agriculture, manufacturing, and trade. Many farmers raise sugarcane, soybeans, sheep, and cattle.

History

People have lived in what is now Bolivia for thousands of years. An advanced people lived in the area around Lake Titicaca (in western Bolivia) about 1,000 years ago. The region was later part of the powerful Inca Empire.

The Spanish conquered the area in the early 1500s. They ruled Bolivia as part of a larger region that included what is now Peru. Silver mines brought great

wealth to the region. By the end of the 1700s, however, there was little silver left. The Bolivians won their independence from Spain in 1825. They named the new republic after Simón Bolívar, who helped free the region from Spain.

After gaining independence, Bolivia fought several battles with neighboring countries. In the War of the Pacific, from 1879 to 1883, Bolivia lost territory along the Pacific Ocean to Chile. In the Chaco War, from 1932 to 1935, Bolivia lost most of the Chaco region to Paraguay. Bolivia also had trouble forming a stable government. The military ruled several times during the 1900s. But in 2005 the country elected its first Indian president. He promised to give the Indians of Bolivia a greater voice in the country's affairs.

Bomb

Bombs are weapons that people use to kill others and to damage property. Bombs are designed to explode. They may be dropped from aircraft, delivered by rockets, thrown by hand, or placed next to a target and blown up later.

Parts of a Bomb

A bomb is basically a container filled with explosive material. This material is usually a mixture of chemicals. A part called a fuse ignites (sets on fire) the explosive material. There are several types of fuses. Some fuses cause the bomb to blow up when it hits something. Other fuses cause the bomb to explode after a certain amount of time.

Bombs that fly through the air have fins or wings to keep them steady. Some bombs, called smart bombs, have a system that allows people to guide them in flight from far away.

A U.S. Air Force plane drops bombs during an attack on Afghanistan in 2001.

Types of Bombs

Armies and other military forces use several types of bombs. Demolition bombs destroy buildings with a powerful blast. Fragmentation bombs explode into small, fast-moving metal fragments that are meant to kill people. General-purpose bombs combine demolition and fragmentation. Armor-piercing bombs are heavy and pointed. Armies use them against protected targets. Incendiary bombs cause intensely hot fires. Cluster bombs contain many small bombs, or bomblets.

Criminals and terrorists sometimes make and use their own bombs. These bombs may be simpler than the bombs used by armies, but they can be very destructive. They include car bombs, pipe bombs, and letter bombs.

Nuclear bombs are the most powerful bombs of all. There are two types of nuclear bombs: atom and thermonuclear (or hydrogen). They both get their tremendous force from reactions that take place in the nuclei, or centers, of atoms. (Atoms are the tiny building blocks of everything.) The energy released by a nuclear bomb destroys nearly everything for miles around.

History

Grenades were the earliest bombs. These are small devices that are thrown by hand. Soldiers first began using grenades in about the 1400s. Eventually other, more accurate weapons were developed. But grenades are still used today.

After airplanes were invented in the early 1900s armies started using them to drop bombs. During World War I (1914–18) bomber planes could not carry many bombs at one time. By World War II (1939–45), however, that changed. Airplanes were able to carry larger bombs in much greater numbers.

The first nuclear bombs were developed during World War II. The war ended shortly after the United States dropped atom bombs on two Japanese cities, Hiroshima and Nagasaki, in August 1945. The bombs caused immense devastation. They killed more than 100,000 people. The United States tested the first hydrogen bomb in November 1952. It was even more powerful than the atom bomb. Several other countries later developed nuclear bombs of their own.

In the 1980s and 1990s many people were afraid that other countries would use nuclear weapons. Leaders of the countries that had such weapons began to talk about ways to control the weapons. They agreed to limit the production, testing, and use of nuclear weapons. In 1996 representatives from approximately 60 countries signed an agreement to stop all testing. The agreement was called the United Nations Comprehensive Test-Ban Treaty.

In wars today armies still use traditional types of bombs. However, new inventions have made it easier to deliver them

A huge cloud forms after a test of an atom bomb. The bomb causes so much damage that it has been used only twice.

with greater accuracy. Armies therefore do not use as many bombs as they once did.

Bone

Humans and many other animals have a skeletal system made up of hard pieces called bones. Bones help to support the body and to protect its organs. Bones store important nutrients and minerals, too. Bones also make blood cells. The human body has more than 200 bones.

Bone Structure

There are two basic types of bone: compact bone and spongy bone. Both types are made of calcium and other minerals, fibers of protein, and water.

Compact bone is solid and very hard. It makes up the outer layer of all bones. It also makes up the shaft, or long tube, of arm and leg bones.

Spongy bone lies beneath most compact bone. It looks like a honeycomb or a sponge, but it is not soft. The many spaces within spongy bone let it absorb shock, or sudden pressure on the bone.

Bone marrow fills the hollow spaces in spongy bone. It also fills the hollow tubes of long bones. Marrow is a soft, jellylike substance that can be red or yellow. Red marrow makes blood cells. Yellow marrow stores fats.

An inside view of an arm bone shows that it is made of two different types of bone. The outside edges are compact bone, and the inside part is spongy bone.

A broken bone is considered a simple fracture if it stays beneath the skin. It is a compound fracture if it breaks through the skin.

A thin membrane, or skin, covers each bone. The membrane contains nerves and blood vessels that are attached to the bone. The blood vessels carry nutrients to the bone. They also carry blood cells from the bone to the rest of the body.

How Bone Is Made

Special cells start making new bone by building a structure of protein. Blood then brings in calcium, which sticks to the structure. When the calcium hardens, the new bone is complete. The body can also rebuild bone that wears away or breaks.

Broken Bones

When bones break, the injury is called a fracture. Most fractures are simple, which means they are beneath the skin. If the bone pokes out of the skin, it is called a compound fracture. How quickly the bone heals depends on the patient's age. As people get older it takes longer for broken bones to heal.

Bonn

Population
(2006 estimate)
312,818

Bonn is a city in Germany, a country of central Europe. Germany was divided into two countries from 1949 to 1990. During that period Bonn was the capital of West Germany. The city is famous as the birthplace of the composer Ludwig van Beethoven. It also has many beautiful parks. Bonn lies along the Rhine River.

Many people in Bonn work in government offices or for the University of Bonn. The city is also a transportation center. Bonn has few factories.

A statue in Bonn honors Ludwig van Beethoven. The composer was born in the city.

Bonn began as a village more than 2,000 years ago. The Romans later settled the site. They lost control of the area in about the 400s. Bonn survived as an independent village for many years. Later it was the capital of local rulers. In the 1800s it became a city in Germany.

The city was damaged by bombs during World War II (1939–45). After the war Bonn became the capital of West Germany. West and East Germany were combined in 1990. Berlin then became Germany's capital. But some government offices remained in Bonn.

Bonobo

The bonobo, along with the chimpanzee, is the closest living relative to humans. It is an ape related to the gorilla and the orangutan, as well as the chimpanzee. All these animals are called great apes because they are large and very intelligent. Bonobos and other great apes belong to the larger group of mammals called the primates. The primates also include other apes, humans, and monkeys.

Bonobos can be found in only one area of the world. They live in rain forests in the Democratic Republic of the Congo, a country in Africa. They are highly endangered, or at risk of dying out completely. Humans have hunted them and destroyed much of their habitat.

Did You Know?

Scientists once thought that bonobos were a type of chimpanzee. In 1933 they decided the two were separate species.

Bonobos live in rain forests. They often feed and even sleep in the trees.

Bonobos look very similar to chimpanzees. They have black hair. Adult male bonobos are larger than the females. Adult males may be almost 4 feet (1.2 meters) tall. They may weigh as much as 134 pounds (61 kilograms). Bonobos do not have a tail, but they have a tuft of white fur where a tail would be.

Bonobos eat mostly fruits. Sometimes they eat leaves and seeds. In rare cases bonobos will also eat small animals, such as bats. They spend the day feeding in trees, resting, and traveling on the ground to other trees. They also can swing from tree branch to tree branch with their arms. Bonobos build leafy beds in trees to sleep in at night.

Book and Bookmaking

A book is a printed work that is meant to communicate. To communicate is to share ideas or information. A book is made up of pages that are usually enclosed in a protective cover. People have written books about all kinds of subjects. Among the countless types of books are novels, picture books, cookbooks, how-to books, poetry books, and textbooks.

From Manuscript to Pages

The first step in creating a book is for an author to write a manuscript. A manuscript is a book before it has been published. The author finds a publisher, or a company that makes and sells books. Editors at the publishing company help the author improve the manuscript. They make sure that the ideas are complete, that the writing is clear, and that there are no errors.

Then the manuscript goes to a designer. This person arranges the text and pic-

A bookshop in Italy displays many different books in its windows.

tures on the pages so that the book looks nice and is easy to read. A designer also creates the cover.

Editors and designers continue working on the pages until they are perfect. Most of this work is done on computers. The designed book is stored in computer files.

Printing Books

Next, the computer files are used to create printing plates. Printing plates are sheets of metal or plastic that have the book's text and pictures on them. Printing plates are put on printing presses and used to print the book.

Most book pages are printed on long rolls of paper. After printing, the paper is folded, cut, and arranged into bundles of pages called signatures. The signatures are sewn and glued together along the folded edges. Finally, the book cover is glued to the signatures. Books can have either a hard cover or a soft cover.

A man works on restoring one of the oldest copies of the Koran, the holy book of Islam. Many old books need repairing as they have started to fall apart over the years.

History

The earliest forms of bookmaking date back to about 3000 BC. The first ancestors of books were Egyptian papyrus rolls. The rolls consisted of a long strip of paper made from a type of water grass called papyrus. Other ancient forms were made of clay tablets, sheets of animal skin, or bundles of bamboo. The Chinese invented paper around AD 100. In Europe people continued to use animal skins, called vellum or parchment long after that. The first papermaking equipment reached Europe in the 1300s.

Early books were difficult to produce. The text was written by hand. Many books made in Europe and in the Islamic world had elaborate drawings. As a result, books were expensive and hard for most people to get. Only wealthy, powerful people and certain scholars and religious leaders read these early books.

The invention of printing changed that. In about 1450 a German craftsman

Offset printing is one method of printing. Text and images appear on a printing plate (left), which is used to print the book pages. The stack of printed sheets (right) are ready to be cut and folded into signatures.

An illustration in an old manuscript shows how books were made long ago. The few people who knew how to read and write copied the text by hand.

named Johannes Gutenberg invented a special type of printing press.

Gutenberg's press used metal type, or letter shapes made from metal.

Gutenberg arranged the metal type in trays to spell out words and sentences. Then he spread ink onto the metal type and pressed the trays against sheets of paper. The trays could be used again and again.

Gutenberg's type and press could print many books quickly. By the 1500s thousands of printing shops were producing millions of copies of books. Books became available to ordinary people for the first time.

Today books are published in every language. Personal computers have allowed people to publish their own books. Many books can be read or downloaded from the Internet. This has made books easier to get than ever before.

Boomerang

A boomerang is a curved throwing stick. People use boomerangs as toys or as weapons. The Aborigines, the native people of Australia, have long used boomerangs for hunting and warfare.

There are two types of boomerangs: returning boomerangs and nonreturning boomerangs. Returning boomerangs are lightweight and have a special curved shape. A returning boomerang flies in a circle and comes back to the thrower.

A guide in Australia shows how to throw a boomerang.

People use returning boomerangs for sporting events and as toys.

Nonreturning boomerangs are not toys. Ancient peoples used them for killing prey or enemies. This type of boomerang is much straighter than a returning boomerang. It cuts through the air in a wobbly way.

True boomerangs are found mainly in Australia. However, people in ancient Egypt, southern India, and other cultures also used boomerang-shaped weapons. Some Native American groups used boomerang-shaped weapons for hunting.

The first boomerangs were made from a single piece of carved wood. The carver heated the wood in hot ashes and then bent it to get the right shape. Today boomerangs used for sports are often made of plywood or fiberglass. Their shape can be very different from the curved shape of traditional boomerangs.

Boone, Daniel

The American frontiersman Daniel Boone blazed a trail through the Cumberland Gap, a pass in the Appalachian Mountains. His trail opened the West to settlement and made him a hero.

Daniel Boone was born in Pennsylvania on November 2, 1734. He had little schooling, but he learned to read and write. He also learned blacksmithing, weaving, hunting, and trapping. When

A detail of a painting from 1851 shows Daniel Boone escorting settlers through the Cumberland Gap.

he was about 16, he moved with his family to the North Carolina frontier. He hunted and trapped in the wilderness.

Boone first passed through the Cumberland Gap into Kentucky in 1767. In 1773 Boone tried to settle in Kentucky with his family, but an Indian attack forced them to turn back. Two years later a company hoping to make Kentucky a new colony hired Boone to open a trail through the gap. The trail Boone cut was called the Wilderness Road. Boone built a new settlement, Boonesborough (now Boonesboro), at the end of the trail.

Boone became famous as a frontiersman, but he was still poor. He owned none of the land he helped open to settlement. He moved around with his family, working various jobs. He continued to hunt and trap. Boone died in Missouri on September 26, 1820.

Bosnia and Herzegovina

For most of the 20th century Bosnia and Herzegovina was a part of the country of Yugoslavia. A civil war in the 1990s ended with Bosnia and Herzegovina's independence. The capital is Sarajevo.

Geography

Bosnia and Herzegovina is located on the Balkan Peninsula in central Europe. It is bordered by Croatia, Montenegro, Serbia, and the Adriatic Sea. Bosnia is the larger of the two regions. It occupies the northern and central parts of the republic.

Bosnia and Herzegovina is a mountainous country. It has many rivers, including the Bosna, from which the country takes its name.

Plants and Animals

Pine, beech, and oak forests cover about half of Bosnia and Herzegovina. The country's varied wildlife includes bears,

wolves, wild pigs, wildcats, chamois (goatlike animals), otters, foxes, badgers, and falcons.

People

The major ethnic groups are Bosniacs (Muslims), Serbs, and Croats. Bosniacs constitute more than two fifths of the population, Serbs less than one third, and Croats less than one fifth. All three peoples speak the same language, Serbo-Croatian.

The Serbs are mostly Orthodox Christians, while the Croats are mainly Roman Catholic. The Bosniacs are descended from Slavs who converted to Islam under the rule of the Ottoman Empire.

Economy

Almost half of the people work in manufacturing and mining. Manufacturers produce cement, steel, and pig iron. Mines provide coal, iron ore, and other metals. Trade and services are other key parts of the economy.

Agriculture and logging are also important. Crops include corn, potatoes, wheat, cabbages, oats, plums, and tobacco.

History

Slavic peoples settled in what is now Bosnia and Herzegovina in the 500s and 600s. Between brief periods of indepen-

Fireworks light up the sky at a celebration in Mostar. The city's bridge was destroyed during the civil war that broke out in the 1990s. But it was rebuilt and reopened in 2004.

dence, a series of other groups controlled the region.

The Ottoman Empire conquered Bosnia in the 1400s. Much of the native population, mainly landowners, converted to Islam. In the 1700 and 1800s, tensions grew between the Muslim landowners and the Christian peasants, who were Serbs and Croats.

The Austro-Hungarian Empire officially claimed the area in 1908. Bosnian Serbs soon began protesting against Austro-Hungarian rule. In 1914 a Bosnian Serb killed Austrian archduke Francis Ferdinand. The assassination triggered World War I. After the war Bosnia and Herzegovina became part of a new Serbian-controlled kingdom named Yugoslavia.

After World War II Yugoslavia became a Communist state. When the Communist government fell in 1989, the tensions between Serbs, Croats, and Muslims reemerged. Bosnian Croats and Muslims wanted an independent republic. Bosnian Serbs, however, refused to separate from Yugoslavia.

Shortly after Bosnians voted for independence in early 1992, a civil war broke out between Serbs, Croats, and Muslims. The fighting left more than 2 million people homeless and killed more than 200,000. The warring parties finally agreed to peace in 1995. Bosnia and Herzegovina had gained its independence.

Boston is the capital of the U.S. state of Massachusetts. The city lies on a harbor where the Charles River flows into the Atlantic Ocean. It is one of the oldest cities in the United States. Boston is a leading center of education, culture, medicine, and business in the New England region.

Insurance, finance, and computer industries are central to Boston's economy. Many important hospitals and universities are located in the city. In nearby Cambridge is Harvard University. It is the oldest university in the United States. Other important industries in Boston include food processing, publishing, and electronics manufacturing.

Quincy Market is a shopping and gathering place in Boston.

The USS *Constitution*, which is nicknamed Old Ironsides, was launched from Boston in 1797. It is now part of the Boston National Historical Park.

Boston was one of the first cities that Europeans settled in what is now the United States. English settlers founded the town in 1630. It soon became the capital of the Massachusetts Bay Colony. Boston's fine natural harbor made it an important city. It grew as a center of shipping as well as of culture and education.

Two important events happened in Boston in the years leading up to the American Revolution. In the Boston Massacre of 1770 British troops shot at an angry crowd. In the Boston Tea Party of 1773 colonists dumped shiploads of British tea into the harbor. They did this to protest British taxes on tea. During the war American troops gained control of the city from the British.

In the 1800s the people of Boston took a leading role in the movement to end slavery in the United States. For a time the city was an important manufactur-

ing center. In the late 20th and early 21st centuries the city's high-technology and service industries grew.

Botany

Botany is the study of plants. It is a branch of biology. Scientists who work in the field of botany are called botanists.

Botany is important because people and animals depend on plants in many ways. People and animals get food and oxygen from plants. People also use plants to make clothing, building materials, drugs, and countless other things.

Botanists usually focus on a specific area. Some discover new kinds of plants,

Botanists make field trips to study plants in their natural environment.

Children learn how to care for potato plants at a botanical garden. Such gardens are designed to teach the public about the plants that are on display.

name them, and classify them (group them with similar plants). Other botanists study the structure and form of plants.

Many botanists work as researchers. Some researchers study plant diseases. Others experiment with plant chemicals. Others try to develop plants that are more useful to humans.

Many botanists are interested in conservation. Some investigate the effects of pollution on plants. Others work to protect rare plants.

Theophrastus, a Greek thinker who lived in the 300s BC, is considered the founder of botany. In the 1700s a Swedish botanist named Carolus Linnaeus created a system for naming and classifying plants. Scientists around the world still use this system today.

Botswana

Since gaining independence in 1966, the African country of Botswana has enjoyed a stable government, economic growth, and harmony between its peoples. The country's unspoiled wilderness draws many visitors. The capital is Gaborone.

Geography

Botswana is bordered by Zimbabwe, South Africa, Namibia, and Zambia. Rivers, including the Chobe, the Limpopo, and the Molopo, form several of the borders. The country is almost entirely flat, with hills only in the southeast and northwest. The Kalahari Desert covers most of the south and west. The Okavango Swamp lies in the northwest. Much of the country has hot summers and cooler winters.

Plants and Animals

Savannas, or grasslands with scattered trees, cover much of Botswana. The

Lions rest in Botswana's Chobe National Park.

Kalahari has desert grasses and scrub. True forests occur only in the far north.

Botswana's wildlife includes lions, elephants, leopards, giraffes, buffalo, antelopes, zebras, wildebeests, ostriches, snakes, and scorpions. Hippopotamuses, crocodiles, and hundreds of types of birds live near the rivers.

People

Botswana's largest ethnic group is the Tswana, followed by the Kalanga. Scattered groups of San live in the Kalahari. About half of the people live in cities and towns, mainly in the southeast. The official language is English, but most people speak Setswana in daily life. About 40 percent of the people follow traditional African religions. The rest of the people are mostly Christians.

Economy

Botswana's economy is based largely on mining. The country has rich deposits of

The Okavango River delta in northern Botswana is a vast swampland.

diamonds, soda ash (sodium carbonate), copper, nickel, and coal. Diamonds are Botswana's most valuable export. Manufacturers make cars, beverages, and bricks. Tourism is a major source of income.

Livestock raising and farming, the traditional occupations of the Tswana, still employ most of the workers. Farmers raise goats, cattle, and sheep. They grow sorghum, legumes, and corn.

History

Botswana's earliest inhabitants were probably Khoekhoe and San peoples. Archaeologists believe that these people first arrived in the region in about 17,000 BC. Bantu-speaking farmers began migrating to the area in about AD 190. In the 1700s the Tswana people arrived and established several powerful states. They soon came to dominate the country that is now named after them.

In 1867 the discovery of gold excited European interest in the area. In 1885 the region came under the control of the British, who called it the Bechuanaland Protectorate.

In 1966 Bechuanaland gained independence as the Republic of Botswana. The country's first president, Seretse Khama, promoted democracy and built up the economy. Problems between Botswana, Rhodesia (now Zimbabwe), and South Africa eased in the 1980s and 1990s.

Stability in southern Africa allowed Botswana to focus on solving its own problems. In the early 21st century those problems included a large gap between the rich and the poor, unemployment, and a high rate of HIV infection and AIDS.

Boxing

Boxing is a sport in which two people fight with their fists. A boxing competition is called a match, a fight, or a bout. A boxer can win by knocking out the other boxer. A boxer can also win by scoring more points than his opponent.

A Boxing Ring and Equipment

A boxing match takes place on a square platform called a ring. The ring is surrounded by ropes. The ropes keep the fighters from falling out of the ring. Each fighter uses a corner of the ring as a base. During pauses in the fight, the boxers go to their corners.

A boxer wears padded gloves on each hand. To protect the teeth, a boxer wears a mouth guard. Amateur boxers wear padded headgear.

Weight Classes

Professional boxers are grouped by weight into more than 12 different weight classes. The lightest group is the strawweight or mini-flyweight class.

Boxing is a sport that requires strength and stamina.

Fighters in this class weigh no more than 105 pounds (48 kilograms). The heavy-weight class has the heaviest fighters. Heavyweights usually weigh 190 pounds (86 kilograms) or more.

A Boxing Match

A boxing match is divided into three-minute periods called rounds. The boxers get one minute of rest between rounds. A professional boxing match is usually scheduled to last 12 rounds. An amateur match usually has three scheduled rounds. A person called the referee stands inside the ring with the boxers. The referee makes sure that the boxers follow the rules.

A boxer can win a match by knockout (KO) or technical knockout (TKO). A knockout happens after one boxer hits the other so hard that the second boxer falls down. The referee declares a knockout if the second boxer cannot stand up within 10 seconds. The referee declares a technical knockout when a weakened or injured boxer is no longer able to defend himself.

Sometimes neither boxer can win a match by knockout or technical knockout. Then the winner is decided by points. Three judges score the match on scorecards. The judges award points to the boxers for the number of punches that they land, or get through their opponent's defenses. Boxers also score points for defensive skill. To win the match by points, a boxer must have more points on at least two of the three scorecards.

History

Fist-fighting contests date back to ancient times and probably much earlier. In ancient Greece boxers wrapped their hands and forearms in leather for protection. In ancient Rome fighters called gladiators wore leather hand coverings that were studded with bits of metal or metal spikes.

Boxing again became a popular sport in England in the early 1700s. Boxers then fought without gloves. An English fighter named Jack Broughton put together the first set of boxing rules in 1743. In 1838 a new set of rules banned kicking, biting, head butting, and hitting below the waist. The rules were changed again in 1867. These rules required boxers to wear gloves.

During the 1900s most of boxing's heavyweight champions were from the United States. Jack Dempsey and Joe Louis were famous U.S. heavyweight champions in the first half of the 1900s. Later champions included Rocky Marciano, Muhammad Ali, and Joe Frazier. In the 21st century boxing became

increasingly popular with women. They now participate in both amateur and professional matches.

Brachiosaurus

Brachiosaurus was one of the tallest of all dinosaurs. The name *Brachiosaurus* means “arm lizard” in Latin. Scientists call it this because of its long front legs. *Brachiosaurus* belongs to the group of dinosaurs known as sauropods. The sauropods were plant-eating dinosaurs with long necks, massive bodies, and four pillarlike legs.

When and Where *Brachiosaurus* Lived

Brachiosaurus lived about 150 to 130 million years ago. Remains of *Brachiosaurus* have been found in Europe,

Brachiosaurus

Did You Know?

Brachiosaurus is the largest and heaviest land animal for which scientists have a complete set of fossil bones.

Africa, and North America. *Brachiosaurus* lived in areas with much plant life, especially tall trees.

Physical Features

Brachiosaurus could reach more than 75 feet (23 meters) in length and weighed up to 80 tons. It stood about 40 feet (12 meters) tall from its head to the ground. The most striking features of *Brachiosaurus* were its sloped back and long neck. Its front legs were longer than its back legs. It also had a relatively short tail. Its dome-shaped head was small, and its snout was somewhat flat. *Brachiosaurus* had a few dozen pencil-like teeth.

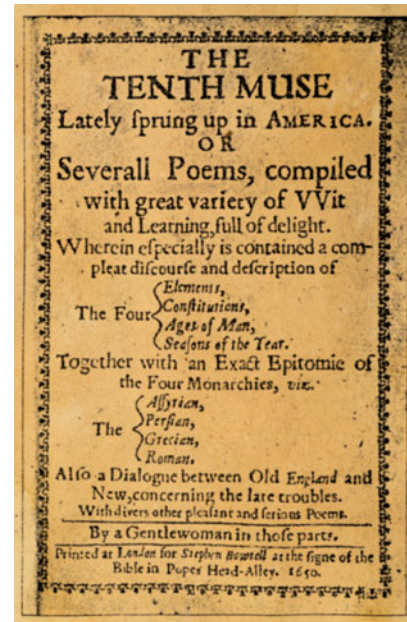

Behavior

Brachiosaurus lived and traveled in herds. Scientists believe that *Brachiosaurus* could travel at speeds of about 12 to 19 miles per hour (19 to 31 kilometers per hour). Its size and weight, as well as sharp claws on its feet, protected it from meat-eating dinosaurs. Its tremendous height also allowed *Brachiosaurus* to watch for enemies coming from miles away.

Bradstreet, Anne

One of the first poets in England's American colonies was Anne Bradstreet. Her poems reflect her religion, a strict form of Christianity called Puritanism.

Anne Bradstreet was born Anne Dudley in Northampton, England, in about 1612. At age 16 she married Simon Bradstreet, the son of a Puritan minister. In 1630 the young couple moved to

Anne Bradstreet's poems were published under the title *The Tenth Muse*.

America with Anne's parents and other Puritans who were setting up the Massachusetts Bay Colony.

Simon was often away from home, leaving Anne on her own with their children. During this time, she began writing about her family and religion. She showed her poetry only to her family. However, her sister's husband had her poems published in England in 1650 as a book called *The Tenth Muse*. It was the first book of poems written by an American.

The Bradstreets moved to Andover, Massachusetts. Anne Bradstreet died there of tuberculosis in 1672. Her works were praised by Puritans in her own time, and they came to be appreciated once more in the 20th century.

Braille

Braille is a system that allows blind people to read and write. It is named after its French inventor, Louis Braille.

Invention

Louis Braille was born near Paris, France, on January 4, 1809. He became blind at the age of 3. At that time blind people read by touching letters engraved in wood, cut in cardboard, or cast in lead. It was a difficult and slow method. There was no method for writing. As a schoolboy Braille developed a system of reading and writing using six dots punched into cardboard.

Braille published his system in 1829. By that time he was teaching at the School for Blind Youth in Paris. The students there quickly accepted it, but the teachers did not. It was not until 1854, two years after Braille's death, that the school adopted the system. From there it slowly spread throughout the world.

The Braille System

Braille is a code of 63 dot patterns called characters. Each character represents a letter, combination of letters, common word, or grammar sign. They are read by touching them lightly. When preceded by a number sign (#), the first 10 letters of the alphabet are read as numbers.

Writing Braille by hand is accomplished with tools called a slate and stylus. The slate consists of two metal plates. A sheet of paper is inserted between the slate's

People read Braille by moving their fingers over a series of raised dots on a page.

two plates. The stylus is a pen-shaped device used to press the paper against pits in the lower plate to form raised dots. A person using Braille writes from right to left; when the sheet is turned over, the dots face upward and are read from left to right. Braille is also produced by special machines.

Brain

In animals, including humans, the brain is the control center for the body. As a part of the nervous system, the brain receives and makes sense of signals sent from nerve cells in the body. The brain also sends information to the body's muscles and organs.

The brains of humans and other vertebrates (animals with a backbone) are large masses of nerve cells protected by a skull. Vertebrates' brains are divided into several sections. Each section has its own functions. The brains of invertebrates (animals without a backbone) are much simpler.

The Human Brain

The human brain is a very powerful organ. It controls the working of all parts of the body. It also controls a person's thoughts and feelings. The brain helps the body to stay healthy and to respond in the right way to its environment.

The brain of an average adult weighs about 3 pounds (1.4 kilograms). It looks something like a mushroom. The “cap” of the mushroom is the cerebrum. It is the very top of the brain and its largest part. Its surface has many cracks and folds. The cerebrum is the “thinking” part of the brain.

The “stem” of the mushroom is the brain stem, which is attached to the spinal cord. The brain stem controls the things that happen automatically in the body. These include the heartbeat, breathing, pleasure, pain, and hunger.

At the back of the head, between the brain stem and the cerebrum, is the cerebellum. It controls balance, posture, and muscles. It also helps in speech.

Brains of Other Animals

The brains of vertebrates other than humans are divided into three main sections: hindbrain, midbrain, and forebrain. In fish and amphibians, the midbrain is the main center of the brain. The midbrain is less important in mammals, birds, and reptiles. These animals have larger forebrains.

The brains of insects and other invertebrates are groups of nerve cells. They are located at the ends of nerve

Brasília

Population
(2007
estimate), city,
2,348,600;
urban area,
3,507,662

Brasília is the capital of the South American country of Brazil. The city lies on the Paraná River. It is famous for the design of its buildings and for the bird- or airplane-shaped layout of its streets.

Many large companies have offices in Brasília. The government of Brazil employs many people in the city. Many others work in banking, law, or other service industries.

Brasília was built in just a few years, starting in the late 1950s. Rio de Janeiro was the capital of Brazil until 1960. In that year the government offices began moving to Brasília. The new city grew rapidly.

Brass

Mixing the metals copper and zinc together makes brass. Such a mixture of metals is called an alloy. Brass is often used to make tools and machine parts. Sculptors and other artists use brass because it is easy to shape. Brass doorknobs, faucets, and towel racks are found in many homes. Brass is also used to make such musical instruments as trombones, trumpets, and French horns.

Working with Brass

It is possible to work with brass when it is hot or cold. Hot, melted brass can be poured into molds of many different shapes. As the brass cools, it hardens. Cold brass can be pounded, pressed, or engraved (scratched with a design).

History

People in western Asia made brass more than 2,000 years ago. People in ancient Greece and Rome used brass for jewelry, armor, and cups and bowls. From the 1200s to the 1600s people in Europe made large brass plates to decorate graves. They also used brass for church decorations, bowls, candlesticks,

Did You Know?

Brazil's leaders moved the capital to Brasília because they wanted people to move inland and develop the country's resources.

Bratislava

Population
(2006 estimate)
417,653

Bratislava is the capital of the Central European country of Slovakia. The city lies on the Danube River. It is Slovakia's largest city and center of culture and education.

Many people in Bratislava work for the government. Others work in business

offices, banks, and other places that provide services. Factories in the city make cloth, chemicals, and electrical goods. Bratislava is home to a number of schools, including Comenius University. The city also has many museums and theaters.

In ancient times the Celts and Romans built forts and villages in the Bratislava region. A group of Slavs known as the Slovaks arrived in the 500s or 600s. In the 900s the area became part of the kingdom of Hungary. Bratislava was the capital of Hungary for about 250 years in the 1500s to 1700s. Hungarian lawmakers met in Bratislava until the mid-1800s.

In 1918 Slovakia became a part of the new country of Czechoslovakia. Bratislava was capital of the province. In 1993 Slovakia became an independent country with Bratislava as its capital.

Brazil

The largest country in South America, Brazil takes up about half of the continent. Brazil's Amazon River basin, including the Amazon rain forest, is one of Earth's richest areas of plant and animal life. The capital is Brasília.

Geography

Brazil shares borders with every South American nation except Ecuador and Chile. The Atlantic Ocean lies to the east. Brazil's two main geographical regions are the Amazon River basin in the north and the Brazilian Highlands in the center, east, and south. The northeastern coast is flat and dry. The southeastern coast includes narrow plains and mountains. In the west-central part of Brazil is a vast wetland called the Pantanal.

Brazil is the world's largest tropical country. It is hot year-round in much of

the country, but temperatures are cooler along the coast and in the south.

Plants and Animals

The Amazon rain forest has the most varied plant life on Earth. Animals living in the trees include tree frogs, salamanders, monkeys, and swarms of insects, including many butterflies. Parrots, macaws, and hummingbirds are common birds. Larger animals in the rain forest include jaguars, tapirs, pumas, and sloths. Along the riverbanks are found capybaras (the world's largest rodents), as well as alligators, boa constrictors, and turtles. The Amazon River itself contains electric eels, catfish, piranhas, manatees, and freshwater dolphins.

Grasslands cover most of the Brazilian Highlands. In the Pantanal wetland are great numbers of birds, reptiles, insects, and such larger animals as anteaters and armadillos. In the drier northeast the plant cover is low and spread out. Thicker woodlands of thorny trees grow in moister areas.

People

Brazil's population is a mix of several different ethnic groups. The country was a colony of Portugal for more than 300 years. Today, more than half of the people are white, descendants of the Portuguese colonists or other European immigrants. About 40 percent of the people have a mixture of white and American Indian or black roots. Smaller

The Pantanal is the world's largest wetland.

numbers of people have mainly African, Asian, or American Indian ancestors. Most Brazilians speak Portuguese. Roman Catholicism is the main religion, though many Indian and African beliefs are also practiced.

More than 80 percent of Brazil's people live in cities or towns, and 13 of those cities have more than 1 million inhabitants each. São Paulo and Rio de Janeiro are two of the world's largest cities.

Economy

Services—including education, government, banks, hospitals, restaurants, and the military—are the largest part of Brazil's economy. Manufacturing is the second most important area of the economy. The country mainly produces foods, petroleum products, cars and trucks, electrical equipment, steel, and chemicals. Brazil's industries use its reserves of iron, silicon, clay, quartz, gold, coal, petroleum, natural gas, and wood.

Farmers use less than 10 percent of Brazil's land, mostly in the south. However, Brazil is one of the world's top producers of oranges and coffee. Farmers also grow sugarcane, soybeans, corn, cassava, rice, bananas, tomatoes, and many other crops. They raise great numbers of cattle and hogs.

History

Before the Portuguese arrived in what is now Brazil, at least 2 million American

Indians lived there. Many were hunters and gatherers. Others lived in large villages and were expert farmers and fishermen.

In 1500 the navigator Pedro Álvares Cabral claimed the land for Portugal after landing near what is now Pôrto Seguro, Brazil. Portuguese settlers soon began bringing in Africans to work as slaves on plantations and, later, in mines. By 1822, when the slave trade ended, about 4 million Africans had been brought to Brazil.

When the French emperor Napoleon I threatened to invade Portugal in 1808, the Portuguese royal family fled to Brazil. They ruled from there and made Brazil equal with Portugal in the new United Kingdom of Portugal, Brazil, and the Algarves. The king returned to Portugal in 1821, but his son, Dom

Pedro, stayed in Brazil. The next year Dom Pedro declared Brazil's independence from Portugal and became emperor of the new nation. In 1889 the emperor Pedro II was forced to give up his power, and the monarchy came to an end. Brazil became a federal republic with an elected government.

Since its independence, Brazil has been one of Latin America's most stable nations, though dictators and the military have ruled at times. Since 1985 civilian (nonmilitary) presidents have led Brazil. In 1988 the country adopted a new constitution that guaranteed basic social and labor rights. Brazil continued to struggle to strengthen its economy, which has suffered from long periods of rising prices.

Brick and Tile

Brick and tile are two different but closely related building materials. Both are made from a mixture of clay, sand, and other fine particles called silt.

Brick

Brick is one of the world's oldest building materials. Making bricks is easier than cutting and hauling stone for building. The basic steps in brick making are the same today as they were thousands of years ago. First, workers dig up the clay. Sometimes they mix the clay with sand or other materials to make it stronger. Next, workers form the clay into small, rectangular blocks called bricks. After the bricks dry, workers bake, or fire, them in very hot ovens called kilns.

Builders use bricks mainly to make walls, but floors and walkways can also be made of bricks. To make strong walls, builders lay the bricks in interlocking patterns. This means that each brick lies on more than one other brick. Builders

Bricks are laid in an interlocking pattern in order to build a strong wall.

fill in the spaces between the bricks with mortar, or sand mixed with cement and water.

Tile

Like brick, tile is also made from baked clay. However, tiles are thinner than bricks. They may also be curved or cut into geometric shapes. In addition, there are more kinds of tile than of brick. Tiles made of red clay, called terra-cotta tiles, have surfaces that are easy to mold. This type of tile has long been used for covering roofs.

When tiles are coated with glaze and then fired at high temperatures, they are called ceramic tiles. The glaze gives them a shiny, colorful appearance and makes them waterproof. Ceramic tiles cover the walls and floors of many kitchens and bathrooms.

Today some tiles are made from plastic and other artificial materials. Artificial tiles cover walls and floors in many modern buildings.

History

The ancient Babylonians made brick houses 6,000 years ago. The ancient Egyptians, Greeks, and Romans also built with bricks and tiles. The Romans were especially good at making tiles. They even used tiles to build pipes that carried water. Native Americans in dry regions built houses with adobe, or sun-dried, bricks.

Early builders often made their bricks right at the construction site. In the 1800s people developed new and faster ways of making bricks and tiles. Factories began producing them in large quantities. Today many builders use newer construction materials such as concrete and cinder blocks. Nevertheless, brick and tile are still popular building materials. They are also commonly used in drainage systems.

Bridge

A bridge is a structure that allows people and vehicles to cross over an open space. Bridges span, or stretch across, deep pits in the earth, bodies of water, and roads.

Types of Bridges

The beam bridge is the oldest, simplest, and most common type of bridge. A beam bridge is a horizontal, or level, structure. It has a support on each end. Other supports, called piers, may also hold up the bridge between the two

ends. A log or a plank that crosses a stream is a beam bridge in its most basic form. Modern beam bridges are usually made of steel beams, called girders. Most highway bridges are beam bridges.

Like the beam bridge, the truss bridge has a support at each end. It may also rest on piers in between. But a truss bridge is stronger than a simple beam bridge. A framework of metal or wood bars connects the two ends of the bridge. These bars fit together in triangular shapes. They often form a sort of tunnel through which the roadway passes.

The cantilever bridge is made up of structures called cantilevers. A cantilever is a beam that has a pier at only one end, like a diving board. A framework of many bars adds strength to the beam, as in a truss bridge. At least two of these beams stretch toward each other to form a cantilever bridge.

Like the beam bridge, the arch bridge is a very old design. An arched structure built beneath the bridge's roadway provides its support. Arch bridges often span rivers and valleys.

In the suspension bridge, the roadway hangs from strong wires called cables. The main cables hang between two or more towers. Smaller cables hang down from the main cables. The smaller cables hold up the roadway. Suspension bridges can span longer distances than any other type of modern bridge.

A cable-stayed bridge also uses cables to support the roadway. Its cables run

There are six basic bridge forms. They are the beam, the truss, the cantilever, the arch, the suspension, and the cable-stayed.

directly between the towers and the roadway. They attach to the roadway in straight, diagonal lines.

Some types of bridges are movable. Some may open upward to allow tall ships to pass underneath. Others may turn sideways. Still others, called pontoons, float on water.

History

Early humans built bridges from logs, branches, or stones. They also made suspension bridges with long, tough vines. The ancient Romans built many stone arch bridges that still exist today.

Modern bridge building began in the 1700s. People began building bridges from iron and, later, steel. These metals were stronger and often cheaper than stone. By 1850 some bridges were strong enough to support trains. Concrete became a popular bridge material in the 1900s. Today engineers continue to improve bridge-building techniques.

British Columbia

Canada's only Pacific coast province is British Columbia. It is a scenic land of snowcapped peaks, rushing rivers, and rugged seacoasts. British Columbia was one of the last parts of North America to be explored by Europeans. The capital is Victoria.

Geography

Only the southern half of British Columbia has a coastline on the Pacific Ocean. The northern half borders the U.S. state of Alaska to the west. North of British Columbia are Yukon and the Northwest Territories. Alberta lies to the east. The U.S. states of Montana, Idaho, and Washington are to the south.

Most of British Columbia is mountainous. The ranges include the Rocky Mountains and the Coast Mountains. Between the mountains are plateaus and valleys. Most of British Columbia's rivers, including the Fraser and the Columbia, flow to the Pacific Ocean. Along the coast are hundreds of islands. The largest is Vancouver Island in the southwest.

People

About two thirds of British Columbia's people have roots in Great Britain or Ireland. Many others have ancestors from Asia, especially China. British Columbia has a greater variety of American Indian peoples than any other part of Canada. They include the Kwakiutl, the Nootka, the Haida, and the Salish (Flathead).

Most of British Columbia's people live in the south, near the U.S. border. About 85 percent of the people live in cities or towns. Vancouver is the largest city in the province and the third largest in Canada. Victoria is the second largest city.

Economy

Natural resources are key to the economy of British Columbia. Huge forests, especially along the coast, provide wood that is made into lumber, wood pulp, and paper. Fishing in the rivers and off the coast brings in valuable catches of salmon, halibut, herring, and shellfish. Seafood processing is an important industry. Mines in the prov-

The Coast Mountains overlook the Torres Channel in northern British Columbia.

ince produce copper, gold, zinc, coal, natural gas, and oil. British Columbia does not have much good farmland because the land is too mountainous. But farmers grow fruits and vegetables and produce dairy products.

Most workers in British Columbia have jobs in service industries such as tourism, finance, real estate, health care, and sales. Millions of people visit the province each year, especially to see its spectacular scenery. The money those people spend is important to the economy.

History

About 80,000 American Indians lived in what is now British Columbia when European explorers arrived. The British sea captain James Cook visited the coast in 1778. In 1792 another British explorer, George Vancouver, sailed around the island that was later named for him. In 1793 the Scottish explorer and fur trader Alexander Mackenzie reached the Pacific coast after traveling overland from the east. Fur-trading companies, including the Hudson's Bay Company, set up trading posts and forts in the region.

In the 1800s Americans began to settle in the region that is now Washington and Oregon. For years the British and U.S. governments disagreed about the border between their lands. In 1846 the border was set, and Vancouver Island became British territory. In 1849 the British made the island a colony.

Gold was discovered on the Fraser River in 1858, and thousands of people came to the mainland in search of riches. The mainland was made a colony that same year. In 1866 the island and the mainland were combined to form the colony of British Columbia. In 1871 British Columbia became a province of Canada. A railroad linking the province with eastern Canada was completed in 1885. This helped spark much development in British Columbia. In the late 1900s it became one of Canada's leading provinces.

Bronze

Mixing the metals copper and tin creates bronze. Bronze, like other mixtures of metals, is called an alloy. Bronze is harder and stronger than copper. It also does not wear away as easily as either copper or tin. For these reasons bronze is often used to make tools and machinery. Bronze is also used to make electrical hardware, springs, fasteners, and coins. Bronze has been the most popular metal for making statues and other artistic objects since ancient times.

Working with Bronze

After melted bronze is poured into a mold and begins to cool, it expands. As the bronze expands, it fills in every detail of the mold. When the bronze cools further and hardens, it shrinks a little bit. This makes the final object easy to

remove from the mold. Bronze also changes colors when exposed to air and water. This effect is called a patina and can be very beautiful.

History

People first discovered how to make bronze more than 5,000 years ago. The discovery of bronze allowed ancient peoples to make tools and weapons that were stronger and longer lasting than any made before. These advances were so important that the ancient period of bronze making came to be called the Bronze Age. People later began making statues, church bells, doors, bowls, and many other objects out of bronze.

Alloy • Bronze Age • Metal

Bronze Age

The Bronze Age was a time in early human history when people first began to use tools made of bronze. It began in some places about 5,000 years ago. It began later in other places. Learning how to use bronze led to advances in many areas of human life.

Background

The earliest humans lived during the Stone Age. Stone Age humans made tools and weapons of stone. By about 6500 BC people had learned how to shape copper into tools and other objects.

Eventually people learned how to mix tin with copper to make bronze. They

A bronze figure of a girl was made in Greece about 2,500 years ago.

People used bronze to make daggers and other tools during the Bronze Age.

probably discovered how to do this by accident. In some places copper and tin are mixed together naturally in the ground. When ancient metalworkers melted this mixture, they made a form of bronze.

Bronze looked like copper. But it was harder and more useful for making tools, weapons, and artwork.

Events of the Bronze Age

The Bronze Age began in Greece and China before 3000 BC. Bronze Age cultures also developed in Mesopotamia (in modern Iraq), Egypt, and the Indus River valley (in modern Pakistan). The Bronze Age had spread to Great Britain by about 1900 BC. Peoples outside Europe, North Africa, Asia, and the Middle East did not have a Bronze Age.

At first only rich people could afford bronze. For a long time farmers and craftspeople used cheaper stone tools to do their work. But eventually more people did metalworking as a full-time

job. Metalworkers, other craftspeople, and farmers came together in cities to trade their goods. This helped civilizations to grow. Two new inventions—the wheel and the ox-drawn plow—also helped Bronze Age civilizations to grow.

In about 1200 BC people learned how to shape iron into tools. This began the Iron Age and ended the Bronze Age.

Brooks, Gwendolyn

Gwendolyn Brooks

The U.S. poet Gwendolyn Brooks wrote about African American life. She wrote especially about the everyday lives of blacks in cities. Her poems describe the racism and poverty that African Americans have faced.

Did You Know?

In 1985–86 Gwendolyn Brooks was the Library of Congress consultant in poetry. This is the top honor for a U.S. poet.

Gwendolyn Elizabeth Brooks was born in Topeka, Kansas, on June 7, 1917. She grew up in Chicago, Illinois. She wrote her first poem at age 7.

Brooks's first collection of poems was published in 1945. It was called *A Street in Bronzeville*. In 1950 Brooks won an award called the Pulitzer prize for her book *Annie Allen*. The poems are about a black girl growing up in Chicago. Brooks was the first African American to win a Pulitzer prize.

Brooks's most highly praised collection, *The Bean Eaters*, was published in 1960. It contains some of her most famous poems, including *We Real Cool*. Written in a simple style, *We Real Cool* describes the difficulties of poverty on youth.

In addition to poetry, Brooks wrote a novel based on her life. She also taught poetry and English at different schools throughout her career. Brooks died in Chicago on December 3, 2000.

Brown, John

As an abolitionist, John Brown wanted to end slavery in the United States. Unlike most abolitionists, however, he took the law into his own hands. Opponents of slavery admired him, but others considered him a dangerous criminal.

John Brown was born on May 9, 1800, in Torrington, Connecticut. He moved to Ohio as a child. As an adult he moved restlessly from state to state. He tanned leather and also tried other trades. He

John Brown

was married two times and had many children.

For a time he and his family lived in a black community in New York state. He had always opposed slavery, but in the 1850s he became more determined to take action against the practice.

In 1855 Brown found his way to the Kansas Territory, where groups of settlers were fighting battles over the issue of slavery. On May 24, 1856, he and his supporters killed five men at a proslavery settlement in Pottawatomie Creek.

Brown's last raid came on October 16, 1859. He and an armed band attacked a federal arsenal, or weapons storehouse, in Harpers Ferry, Virginia (now West Virginia). He hoped that thousands of slaves would rise in rebellion and follow him to a new mountain stronghold. This did not happen, and after two days he was captured by U.S. troops. Brown was tried and hanged at Charlestown, Virginia, on December 2, 1859.

Brunei

The country of Brunei is a small Islamic sultanate, or kingdom. It lies on the northwestern coast of the island of Borneo, also shared by Malaysia and Indonesia. Large oil and gas reserves make Brunei one of the wealthiest nations in Southeast Asia. The capital and largest city is Bandar Seri Begawan.

The South China Sea and Sarawak, a state of Malaysia, surround Brunei. Sarawak divides Brunei into two sepa-

rate parts. Coral sand beaches line the coast. The rest of the country is hilly. The climate is hot and wet. Seasonal winds called monsoons bring heavy rain.

Rain forests cover the land. Wildlife includes lions, tigers, monkeys, birds, insects, snakes, and lizards.

About two thirds of the population is Malay. About one tenth is Chinese. Other native peoples and Asians make up most of the rest. The main language is Malay, but many speak Chinese or English. About two thirds of the population is Muslim.

The country's economy depends on its large reserves of oil and natural gas. Very little manufacturing exists, aside from petroleum products. Most people work in services or construction.

In the early 1400s Brunei became an independent kingdom. By the 1500s Brunei controlled almost all of Borneo. In the 1800s Great Britain took control of Brunei. In 1959 Brunei gained partial self-government.

During the 1970s the sultan, or king, used the gas and oil profits to improve people's lives. Health care and education are still free to all citizens. Brunei became fully independent in 1984.

Brussels is the capital of Belgium, a country in northwestern Europe. Brussels and its surrounding towns make up the largest metropolitan area in Belgium. The area is one of the country's three regions, called the Brussels-Capital Region.

Many people come to Brussels to visit the city's museums, parks, and public squares. Others come to work in the government offices. The government is the largest employer in the city. Factories in Brussels process foods and make cloth, machines, electrical products, and chemicals. The city has long been

At the heart of Brussels is the Grand Place. It is a public square that began as a marketplace hundreds of years ago.

famous for its lace, carpets, furniture, and art products.

Brussels is also important as a center of European government and trade. The city is the headquarters of two major international organizations—the European Union and the North Atlantic Treaty Organization (NATO).

Brussels was settled in the 500s. It developed around a castle on an island in the Senne River. The city had many different rulers over the years. In the 1100s it began to grow as a center of the cloth trade. In the 1400s Brussels became a leading city in an area known for its art and culture. The Spanish and Austrian empires later ruled the area for about 200 years.

Belgium became part of The Netherlands in 1815. Brussels then shared the status of capital with The Hague. In 1830 Brussels was the main site of a revolt against The Netherlands. Belgium then became an independent country with Brussels as its capital.

Buchanan, James

The 15th president of the United States, James Buchanan failed to solve the slavery crisis of the 1850s and 1860s. He tried to make a compromise between the North and the South but could not prevent the American Civil War.

James Buchanan was the 15th president of the United States.

Early Life

James Buchanan was born on April 23, 1791, near Mercersburg, Pennsylvania. His father was a successful storekeeper and landowner. In 1809 Buchanan graduated from Dickinson College in Carlisle, Pennsylvania. He then studied

law and became a lawyer in 1812. Buchanan never married.

Political Career

Buchanan was elected to the Pennsylvania House of Representatives in 1814. He entered the U.S. House of Representatives in 1821 and the U.S. Senate in 1834. He resigned in 1845 to become secretary of state under President James K. Polk. During that time Texas became a state. This led to a war with Mexico because Mexico claimed part of Texas. Buchanan helped settle another border dispute that came up during his time as secretary of state. The dispute was with Great Britain over the boundary between Canada and the Oregon Territory.

Buchanan ran for president twice in the 1840s but lost. He became minister to Great Britain after Franklin Pierce won the election of 1852. While in Europe Buchanan helped write the Ostend Manifesto. That report recommended

TIMELINE

Buchanan is born near Mercersburg, Pennsylvania.

April 23, 1791

Buchanan becomes secretary of state under President James K. Polk.

1845

Abraham Lincoln is elected to replace Buchanan as president.

1860

Buchanan dies in Pennsylvania.

June 1, 1868

Buchanan becomes a U.S. senator.

1834

Buchanan is elected president.

1856

Seven Southern states leave the Union before Buchanan leaves office.

1861

that the United States take Cuba from Spain, by force if necessary. The Ostend Manifesto increased Buchanan's popularity because the nation wanted to gain more territory.

Presidency

In 1856 the Democratic Party nominated Buchanan for president and John C. Breckinridge for vice president. "Buck and Breck," as they were called, won the election.

As president, Buchanan handled foreign affairs well. At home, however, he stumbled over the question of slavery. The split between the slave states of the South and the free states of the North widened. Several Southern states threatened to withdraw from the Union. Buchanan disapproved of slavery, but he wanted to hold the country together. He believed the United States might avoid a civil war if Northerners stopped protesting slavery and the government protected slave owners.

In 1860 the Democratic Party split into Northern and Southern groups. Neither group wanted Buchanan as its presidential nominee. The split led to the election of the antislavery Republican candidate, Abraham Lincoln. As Buchanan's term was ending, he could not stop seven Southern states from leaving the Union. The result was the American Civil War, which began in 1861.

Retirement and Death

Buchanan retired to his home near Lancaster, Pennsylvania, in March 1861. During his retirement, critics in both

the North and the South attacked him for his efforts at compromise. Buchanan died on June 1, 1868, near Lancaster.

Bucharest

Population
(2007 estimate)
1,931,838

Bucharest is the capital of Romania, a country in eastern Europe. It is the largest city in Romania. Bucharest is also a center of culture and industry. Several factories in the city make electrical equipment and various kinds of machines. Others make chemicals, cloth, clothing, and processed foods.

Culture, shopping, and industry help make Bucharest a lively city.

Did You Know?

James Buchanan was the only president who was never married.

People have lived in the Bucharest area for many thousands of years. By the mid-1400s it was part of a state called Walachia. Vlad III, the prince of Walachia, built the fort of Bucharest. The fort was intended to protect Walachia from attacks by the Turks. Eventually, however, the Turkish Ottoman Empire took over the area. Under the Turks Bucharest became the main economic center of Walachia. In 1659 Bucharest became Walachia's capital.

In 1859 Walachia became part of the new country of Romania. Bucharest was declared the capital of Romania in 1862.

In the early 1900s Bucharest grew as the most important city of a large country. During World War II (1939–45) Bucharest was damaged by bombing. After the war the center of the city was rebuilt. Building projects made the city larger and more modern.

Budapest

Population
(2008 estimate)
1,702,297

Budapest is the capital of Hungary, a country of central Europe. It is the larg-

A statue of Saint Stephen, the first king of Hungary, overlooks the city of Budapest.

est city in the country. Budapest is also an important center of culture, education, and science.

Budapest lies on both banks of the Danube River. The city has two main sections: Buda and Pest. These sections sit on opposite banks of the river. Several bridges connect them. Buda features many hills. Pest is fairly flat.

More than 100 natural hot springs are found in Budapest. Many spas, or resorts, are built around these springs. Partly because of this, Budapest is a major tourist site.

Budapest is also Hungary's center of transportation, manufacturing, and banking. Factories in the city make electronics, communications equipment, chemicals, cloth, and processed foods. Others make buses, railroad equipment, and boats.

In ancient times the Romans built a town on the site of Budapest. Hungarians came to the area in the 800s. They

Did You Know?

Between the later 1800s and 1918, Budapest was one of the two capital cities of the powerful empire of Austria-Hungary. Vienna, Austria, was the other.

later settled the town of Buda. Buda became the capital of the kingdom of Hungary in the 1400s. Slavic groups established Pest. German merchants later developed Pest into a trading town. Both towns came under Turkish rule for a period.

Many buildings in Budapest today date from the 1700s and 1800s. The area was then under Austrian rule. In 1873 Buda and Pest joined together to form a single city.

Fighting at the end of World War II in 1945 severely damaged Budapest. After the war Hungary established a Communist government centered in Budapest. In 1956 there was an uprising in the city against the Communist government. That rebellion failed. In the 1980s more protests led to the fall of Communism in Hungary. Budapest was the center of those protests.

Buddha

The founder of Buddhism was the Buddha, a man born with the name Siddhartha Gautama. The Buddha was a man of great wisdom and compassion. He taught people how to overcome suffering.

Early Life

Siddhartha Gautama was a prince who lived sometime in the 500s to 300s BC. He was born near the border of what are today Nepal and India. Little is

Statues of the Buddha can be found in many Asian countries.

known for certain about his life, though there are many stories about him. He is said to have grown up in luxury, shielded from aging, sickness, and death.

The stories about him say that at age 29 Gautama saw a bent old man for the first time. This greatly troubled Gautama. His chariot-driver, Channa, explained that the man was old and that all people grow old. On another day, Gautama saw a sick man, and later he saw a dead body. Channa explained that all people are subject to sickness and death. Finally, Gautama saw a monk, who looked peaceful. Gautama decided to give up his wealth and become a monk. He wanted to discover how the

monk was able to look peaceful when he was surrounded by suffering.

Finding and Sharing the Truth

Gautama left home in search of the truth. One day, while Gautama was sitting and meditating under a tree, he became enlightened, or free from both desire and suffering. In this way, he became the Buddha, which means “enlightened one.”

The Buddha taught others about Four Noble Truths he discovered. The first truth is that life is full of suffering. The second is that suffering is caused by desire. The third is that humans can free themselves from all that. The fourth truth told the way to achieve this freedom.

The Buddha soon attracted followers, who formed the first Buddhist order, or sangha. The Buddha sent them out into the world to spread his message. The Buddha himself set out traveling, converting many people on the way. He is said to have died at age 80, in a city called Kusinara (now Kasia, India).

Buddhism

Buddhism

The religion based on the teachings of the Buddha is known as Buddhism. The Buddha was born with the name Siddhartha Gautama and lived sometime in the 500s to 300s BC. He became enlightened, meaning that he found a way to free himself from the

A Buddhist monk beats a drum while other monks pray.

cycle of desire and suffering. The Buddha taught his followers how to achieve this too.

Buddhism began in India and spread to central and southeastern Asia, China, Korea, and Japan. It plays a central role in the spiritual, cultural, and social life of Asia. Today some people in the Western world also follow Buddhism. At the beginning of the 21st century Buddhism was the fourth-largest religion in the world, with about 360 million followers.

Some Important Buddhist Holidays

Note: Different countries celebrate these holidays on different dates.	
<i>Theravada Countries</i>	
Wesak (Buddha’s birthday, enlightenment, and death)	one day, usually in May, when there is a full moon

Beliefs and Practices

Buddhism is based on the Buddha's teachings, which are called the Four Noble Truths. The first truth is that life is made up of pain and suffering. The second is that all suffering is caused by one's desires. The third is that one can be free of these desires. The freedom from desire is called nirvana. The fourth truth is the Eightfold Path, which explains eight ways to achieve nirvana.

The Eightfold Path is also called the Middle Path. It teaches that people should not indulge in too much luxury and pleasure. But they should also not harshly deny themselves all worldly comforts. Instead, people should take a middle, or balanced, course.

Buddhism has three main parts. These parts are called the Triratna, or "the three jewels." They are: the Buddha, or the teacher; the dharma, or the teaching; and the sangha, or the community of believers. Buddhist monks believe that the three jewels protect them. This is expressed in the Buddhist prayer, "I take

Buddhist monks wear simple robes and often live in communities called monasteries.

Prayer flags line a walkway near the site where the Buddha experienced his enlightenment.

refuge in the Buddha. I take refuge in the dharma. I take refuge in the sangha."

Divisions

Many years after the Buddha's death two major groups appeared among his followers. One group followed a branch known as Theravada, meaning "Way of the Elders." It is the older and more conservative branch of Buddhism. Many people in Sri Lanka, Myanmar, Thailand, Laos, and Cambodia belong to this group.

The other group is called Mahayana. This form of Buddhism is popular in Mongolia, China (including Tibet), Japan, Korea, Vietnam, and Nepal. Zen Buddhism comes from Mahayana Buddhism.

The Theravada Buddhists concentrate on freeing themselves through improving their own lives. Mahayana Buddhists believe they can achieve enlightenment through a life of good work for others.

History

The Buddha began teaching his philosophy after receiving enlightenment. One day he sat down under a tree in Bodhi Gaya (now in the state of Bihar in India) and began meditating. On the 49th day, he achieved enlightenment and so was freed from suffering. He became known as the Buddha, which means “enlightened one.”

According to tradition, the Buddha lived and taught for 45 years after his enlightenment. The Buddha preached in Pali, which was the language of the common people. He believed that his teachings were for everyone and not just scholars. However, he did not write down his teachings. The Buddha’s followers shared his teachings with other people by word of mouth. These teachings were not put in writing until many years after the Buddha’s death.

The Buddha established a religious order known as the sangha. Many of its members were wandering monks, as the Buddha himself had been. After the Buddha’s death, these monks helped spread Buddhism through northern India. In the 200s BC Buddhism gained a powerful sponsor. Asoka, the ruler of an empire that spanned most of South Asia, embraced and promoted the religion. He built many Buddhist monuments and monasteries.

Buddhism later declined somewhat in India. But from India, Buddhism spread to Sri Lanka and Southeast Asia as well

as through central Asia and Tibet and into China, Korea, and Japan.

Buenos Aires

Population

(2001 census),
city, 2,776,138;
urban area,
11,460,575

Buenos Aires is the capital of Argentina, a country of southern South America. It is one of the largest cities in South America. The city is a center of business, politics, and culture. Buenos Aires is also a leading port. It lies on the Paraná River near the Atlantic Ocean.

The Plaza de la República is one of the major public squares in Buenos Aires.

Cityscape

Buenos Aires has many plazas and parks. Its most important public square is the Plaza de Mayo. The home of Argentina's president and other government buildings surround the square.

There are also many museums and other cultural sites in Buenos Aires. The Colón Theatre is a well-known opera house. It is also home to the national ballet and symphony. Buenos Aires is also known as a center for popular dance and music. The dance called the tango was born there in the late 1800s.

Economy

The port at Buenos Aires is the largest in South America. Shipping goods through the port is important to the city's economy. Manufacturing and service industries also bring money to Buenos Aires. Factories in the city process foods, work metals, put together cars, and process oil. Others make cloth, paper, and chemicals. Printing, publishing, and banking are also important.

History

The Spanish founded Buenos Aires in 1580. The city grew gradually over the next 200 years. In 1776 Buenos Aires became the capital of a large Spanish province. Buenos Aires grew rapidly as a center of trade. In the early 1800s Argentina became free of Spanish rule. Buenos Aires became its capital in 1880.

During the 1900s the city's industries grew. Buenos Aires suffered economic problems in 2001. Afterward the

economy began to grow again. But poverty and crime had become larger problems in the city.

Buffalo

Buffalo are mammals of Africa and Asia. The American bison is often called a buffalo, but it is not a true buffalo. Buffalo are closely related to bison, cattle, and yaks.

There are several types of buffalo. The Cape buffalo lives in Africa, often in grasslands or plains. It is also called the African buffalo.

The buffalo of Asia include the water buffalo, the anoa, and the tamarau. The water buffalo can be found wild in Southeast Asia. It lives in swamps, forests, and grasslands near water. People raise water buffalo as farm animals in Asia and other parts of the world. They use these animals to pull farm equip-

Did You Know?

The Cape buffalo is the only kind of buffalo that lives in the wild in Africa.

People in Asia use water buffalo for many different purposes. The animals pull plows and carry heavy loads. They even provide transportation.

ment and to carry heavy things on their backs. People also keep water buffalo for their milk and meat. Anoa and tamarau live in forests in Southeast Asia. Wild buffalo have become rare in Asia.

Buffalo are heavily built animals. They range in height from about 2.5 to 6.5 feet (0.75 to 2 meters). Some kinds have large, curving horns. Other kinds have straight horns. All buffalo have hooves on their feet. Most buffalo are mainly black, brown, or gray.

Except for anoa, buffalo in the wild live in groups called herds. They spend a lot of time eating and digesting grasses. To digest their food, they swallow it and later bring it back up to the mouth to chew. This makes the food easier to digest when they swallow it a second time.

Bulgaria

The Republic of Bulgaria lies on the Balkan Peninsula in the southeastern corner of Europe. The neighboring Turks of the Ottoman Empire controlled Bulgaria for almost 500 years. The capital is Sofia.

Geography

Bulgaria's only coastline is on the Black Sea, to the east. The Danube River forms most of Bulgaria's northern border with Romania. Bulgaria also shares borders with Serbia, Macedonia, Greece, and Turkey.

The Balkan Mountains stretch across the country. The Maritsa River runs through the central Thracian Plain, a farming area. Much of Bulgaria has a continental climate with warm summers and cold winters. Highlands tend to be wetter than the low-lying farming areas.

People stroll along a boulevard and dine at sidewalk cafés in Varna, Bulgaria.

Plants and Animals

Evergreen trees cover the mountain slopes. The lowland areas have largely been cleared for farming. Deer, bears, wolves, badgers, wild boars, and wildcats may be found in the more remote regions.

People

Ethnic Bulgarians make up almost 85 percent of the population. The only significant minority groups are Turks and Roma (Gypsies). Bulgarians are Slavic people who write their language in the Cyrillic (Russian) alphabet. Bulgaria's traditional religion is a branch of Eastern Orthodox Christianity. More than two thirds of Bulgaria's people live in cities.

Economy

Businesses that serve the public, government work, manufacturing, and mining are the most important parts of Bulgaria's economy. Bulgaria has deposits of coal, iron, copper, petroleum, and natu-

Rock formations in the Balkan Mountains are surrounded by walls and other fortifications. Centuries ago many different groups used the area to protect against enemies.

ral gas. Manufacturers make petroleum products, machinery, and clothing.

About one fifth of Bulgarians work in agriculture, logging, and fishing. Leading crops are wheat, corn, barley, sunflowers, and grapes. Bulgarians also grow roses. The flower's oil is used in perfume. Sheep, pigs, goats, and cattle are the main livestock.

History

What is now Bulgaria was part of an ancient region known as Thrace. In the 1st century AD the Roman Empire took over Thrace. Slavs invaded in the 5th and 6th centuries. The Bulgars, a Turkic people from north of the Black Sea, defeated the Slavs and gave their name to the country.

In the following centuries the Bulgars and the Slavs became one people and converted to Christianity. Two Bulgarian empires followed. The Byzantine Empire defeated the first empire in about 1018.

The second arose in 1185 but fell to the Islamic Ottoman Empire in 1396. Bulgarians lost their independence for about 500 years, but most of them did not convert to Islam.

An uprising against the Ottomans failed in 1876. Two years later, with Russian help, Bulgaria gained partial independence. Bulgaria's leader Prince Ferdinand declared the country fully independent in 1908. Bulgaria then became involved in two wars with its neighbors on the Balkan Peninsula, as well as the two world wars.

After World War II the Bulgarian monarchy fell. Bulgaria became a Communist state under the influence of the Soviet Union. After the fall of Communism Bulgaria held elections in 1990 and worked to build a democratic government.

Bunche, Ralph

U.S. diplomat Ralph Bunche won the Nobel peace prize in 1950. A diplomat is a person who helps countries to make agreements. Bunche won the Nobel prize in honor of his efforts to make peace in the Middle East.

Ralph Johnson Bunch (his family added the final “e” later) was born on August 7, 1904, in Detroit, Michigan. In about 1916, after his parents died, he moved in with his grandmother in Los Angeles, California. Bunche was a good student and a good athlete. He earned a degree from Harvard University in 1934. He then taught at Howard University in Washington, D.C.

During World War II Bunche helped to plan the United Nations (UN), a peaceful organization of many countries. He joined the UN staff in 1947. In 1949 Bunche helped Israel and several Arab nations to make a peace agreement. For this work he won the 1950 Nobel prize for peace. Bunche later led other peace missions. He also worked on the UN program for peaceful uses of atomic energy.

Bunche was involved in the civil rights movement as well. He wanted to help fellow African Americans gain rights to such things as better jobs and education. He was one of the leaders of the National Association for the Advancement of Colored People (NAACP) for more than 20 years. In 1963 he received the Presidential Medal of Freedom.

Bunche died on December 9, 1971, in New York City.

Bunyan, Paul

Many years ago in U.S. lumber camps, loggers dreamed up wild stories about a mythical lumberjack, Paul Bunyan. According to these “tall tales,” neither giant mosquitoes nor rains that lasted for months bothered Bunyan or his companion, Babe the Blue Ox. Other stories told how Bunyan created the Grand Canyon. The Great Lakes were said to have formed when his huge footprints filled up with water.

The tales of Paul Bunyan first appeared in print in 1910 in a newspaper. Two books published in the 1920s helped to turn Bunyan into a national folk hero.

Bunche was the first African American, and the first black person from any country, to win a Nobel prize in any category.

Burkina Faso

Located in West Africa, Burkina Faso was once named Upper Volta after the branches of the Volta River that flow through it. Ouagadougou is the capital.

Burkina Faso is surrounded by Mali, Côte d'Ivoire, Ghana, Togo, Benin, and Niger. Much of the land is flat. The climate is generally hot and dry, but there is a rainy season. The north is part of the Sahel, a semidesert region. The south is semitropical, with wetlands and forests.

Grassland or desert covers much of the country. Wildlife includes antelope, lions, elephants, buffalo, hippopotamuses, monkeys, and crocodiles.

Nearly half of the people belong to the Mossi ethnic group. Others include Fulani, Lobi, Bobo, and Mande. French is the official language, but most people speak Moré. About half of the people are Muslims. The rest follow traditional religions or Christianity. More than 80

percent of the people live in small towns or villages.

Most of the people are farmers. Sorghum, millet, corn, and cotton are the main crops. Farmers also raise goats, sheep, cattle, and chickens. Manufacturers make sugar, cooking oil, flour, beverages, and bicycles. The country also has deposits of gold and manganese.

In the 1400s Mossi and Gurma peoples set up kingdoms in the area. In the late 1800s France took control of the region. It created the colony of Upper Volta in 1919. Upper Volta gained independence in 1960. Since then, the military has overthrown the elected government several times. In 1984 the government renamed the country Burkina Faso, which means “Land of Incorruptible People.”

Burn and Scald

A burn is damage to the skin caused by fire, hot surfaces, chemicals, electricity, or radiation. Radiation is energy that comes from the sun, tanning lamps, X-rays, some cancer treatments, and other sources. Burns caused by hot liquid or steam are called scalds.

How Burns Affect the Body

Doctors classify burns based on how many layers of skin are damaged. First-degree burns affect only the outer layer, called the epidermis. They make the skin red and sore. Sunburns are first-degree burns. Second-degree burns damage the epidermis and some of the

underlying layer, called the dermis. They are red and painful, and they may blister.

Third- and fourth-degree burns are very serious. Third-degree burns damage all of the epidermis and the dermis. Sometimes they reach the fatty tissue beneath. The skin turns leathery and feels numb. Fourth-degree burns go even deeper. They destroy the fatty tissue and may damage the muscles or bone below. They turn the skin black.

Serious burns cause a condition called shock. The victim grows pale and is confused and anxious. Later the blood pressure drops sharply, and the person may collapse. Shock happens because a burn damages the blood vessels in the skin. This causes the blood to lose important fluid. This change in the blood affects all body systems.

Treatment

People can usually treat first-degree burns themselves. The first thing to do is to run cool water over the burn. This stops the burning process. Then they should clean the burn with soap and water. Small burns can be left uncovered to heal. Larger burns can be covered with a bandage.

Large second-degree burns and all more serious burns should be treated quickly by a doctor. Doctors give the person fluids to stop shock and drugs to prevent infection.

Burundi

Burundi is a country in central Africa. It has lost hundreds of thousands of people to violence between its Hutu and Tutsi ethnic groups. The capital of Burundi is Bujumbura.

Burundi is bordered by Rwanda, Tanzania, and the Democratic Republic of the Congo. Burundi lies close to the equator. Areas near the equator usually have a hot climate. But Burundi's high moun-

tains keep temperatures mild. There are dry and rainy seasons each year.

Trees cover the mountain slopes. Grasslands cover the lower areas. Wildlife includes lions, leopards, crocodiles, buffalo, warthogs, and baboons.

More than 80 percent of the people are Hutu. Only about 15 percent are Tutsi, but they have traditionally controlled the government and the military. The official languages are Rundi and French. Christianity is the main religion.

The people of Burundi live mainly by farming. Coffee and tea are important exports. Farmers also grow bananas, sweet potatoes, cassava, beans, sugarcane, and corn. A few manufacturers make beverages, cooking oil, and sugar.

The first people in what is now Burundi were probably the Twa Pygmies. The Hutu likely arrived by the 11th century. The Tutsi followed 300 or 400 years later. Tutsi kings then took control of the region.

In the early 1900s Germany and then Belgium gained control of the area. In 1962 part of the territory became the independent monarchy of Burundi. Fighting soon broke out between the Tutsi and Hutu. Burundi's civil war continued into the 21st century.

Bush, George

After serving two terms as vice president, George Bush became the 41st president of the United States in 1989. The main event of Bush's presidency was the Persian Gulf War.

Early Life

George Herbert Walker Bush was born on June 12, 1924, in Milton, Massachusetts. His family later moved to Greenwich, Connecticut. George was the second of five children born to Prescott Sheldon Bush and Dorothy Walker Bush. His father was a banker and later a U.S. senator.

In 1942 Bush joined the U.S. Naval Reserve. As a Navy pilot, he flew many missions in the Pacific during World War II. In 1945 Bush married Barbara Pierce. After the war he attended Yale University and earned a degree in economics. Bush then moved to Texas,

George Bush was the 41st president of the United States.

where he helped start three companies dealing in oil and drilling equipment.

Political Career

As a member of the Republican Party, Bush ran for the U.S. Senate in 1964

TIMELINE

Bush is born in Milton, Massachusetts.

June 12, 1924

Bush is elected to the U.S. House of Representatives.

1966

Bush becomes the head of the Central Intelligence Agency.

1976

Bush is elected vice president under President Ronald Reagan.

1980

Bush is elected president.

1988

The United States and allies defeat Iraq in the Persian Gulf War.

1991

Bush loses the presidential election to Bill Clinton.

1992

but lost. Two years later he was elected to the House of Representatives. In 1970 he gave up his House seat to run again for the Senate. Again he lost.

President Richard Nixon then made Bush the U.S. ambassador to the United Nations. From 1974 to 1976 he represented the United States in China. Bush then spent a year as director of the Central Intelligence Agency.

In 1979 Bush ran for president. He withdrew from the race in 1980 to become Ronald Reagan's vice presidential running mate. The Reagan-Bush team easily defeated President Jimmy Carter and Vice President Walter F. Mondale. Reagan and Bush were reelected in 1984.

Presidency

In 1988 Bush again decided to run for president. He chose Senator Dan Quayle as his running mate. Bush defeated the Democratic candidate, Michael Dukakis, and was sworn in as president in January 1989.

President Bush was especially interested in foreign policy. In December 1989 he ordered a military invasion of Panama to topple that country's dictator, Manuel Noriega.

In August 1990 the Middle Eastern country of Iraq invaded Kuwait. Bush formed an international alliance and sent U.S. military forces to Saudi Arabia to convince Iraq to leave Kuwait. When Iraq refused, Bush ordered an air attack. The Persian Gulf War, which lasted

from mid-January to late February 1991, ended with the freeing of Kuwait. The U.S. victory made Bush very popular.

Bush's popularity soon fell, however, as the U.S. economy suffered. In addition, Bush broke his promise not to increase taxes. In 1992 Bush lost the presidential election to Bill Clinton. Bush retired to Houston, Texas.

Political Heirs

Bush and his wife had four sons and two daughters. His first son, George W. Bush, served as governor of Texas before being elected president in 2000. Another son, Jeb Bush, became governor of Florida in 1998.

George W. Bush was the 43rd president of the United States.

University with a degree in history. He then served as a pilot in the Texas Air National Guard. In 1973 he began studying at Harvard University. He graduated in 1975 with a master's degree in business.

Bush returned to Midland and started an oil business. In 1977 he married Laura Welch. The couple had twin daughters. In 1978 Bush ran for a seat in the U.S. House of Representatives but lost. He worked as an adviser and speechwriter on his father's campaign during the 1988 presidential election. Bush then joined a group that bought the Texas Rangers baseball team.

Governor

In 1994 Bush ran for governor of Texas and won. He reformed Texas' welfare system and fought crime. He also cut taxes and increased spending for schools. Bush was reelected in 1998 with a record 69 percent of the vote.

Election of 2000

In 2000 Bush ran for president with Richard Cheney as his vice presidential running mate. His opponent was Al Gore, vice president under President Bill Clinton.

TIMELINE

Bush is born in New Haven, Connecticut.

July 6, 1946

Bush defeats Al Gore in the presidential election.

2000

Bush is elected governor of Texas.

September 11, 2001

Terrorists crash airplanes into the World Trade Center and the Pentagon.

The United States attacks the Taliban rulers in Afghanistan.

October 2001

Bush defeats John Kerry to gain a second term as president.

March 20, 2003

U.S. and allied forces invade Iraq.

2004

In the election more people voted for Gore than for Bush. But in a presidential election a candidate must win the votes of a group of people known as the electoral college. That contest was very close. The outcome depended on Florida, as both candidates needed its electoral votes to win. The vote in Florida was also very close, and for several weeks Florida recounted its votes. Eventually the U.S. Supreme Court stopped the recounts. That decision made Bush the winner in Florida and the next president. Bush took office on January 20, 2001.

Presidency

Bush had the advantage of working with a Republican-led Congress. Soon after his election he signed a major tax cut into law.

Bush faced his greatest challenge on September 11, 2001. Thousands died after terrorists flew hijacked airplanes into the World Trade Center in New York City and the Pentagon in Washington, D.C. Bush called for a global war on terrorism. He identified Osama bin Laden, the leader of a group called al-Qaeda, as the main suspect in the attacks. Bush ordered air attacks against the government of Afghanistan, which he accused of helping bin Laden. The government fell by the end of the year.

In 2002 Bush turned his attention to Iraq. Bush accused Iraq's president, Saddam Hussein, of supporting al-Qaeda and of having banned weapons. In March 2003 a U.S.-led force invaded Iraq. Within a few months the force

overthrew Iraq's government, and in December Saddam was captured. U.S.-led troops remained in Iraq to help the country form a new government. However, fighting continued.

Many people protested the war, as well as the poor U.S. economy. Nevertheless, in 2004 Bush was elected to a second term. He defeated Democrat John Kerry.

During his second term Bush appointed two people to the Supreme Court. But he continued to face problems related to the ongoing war and the economy. These issues made Bush and other Republicans very unpopular. They helped Democrat Barack Obama defeat Republican John McCain in the presidential election in 2008. Bush left office in January 2009 and returned to private life in Texas.

Butterfly and Moth

Butterflies and moths are related kinds of flying insects. There are about 100,000 species, or types, of butterflies and moths. They live in many different habitats nearly all over the world.

Physical Features

Butterflies and moths vary greatly in size. The length of their wings spread

Did You Know?

George W. Bush was the second U.S. president whose father had also been president. The first was John Quincy Adams, whose father was John Adams.

out ranges from about 0.2 inch to 12 inches (4 to 300 millimeters).

Butterflies and moths have many features in common. Like all insects, they have six legs. Most adults have two pairs of wings. Dustlike scales cover the wings, body, and legs.

There are several differences, however, between butterflies and moths. Butterfly antennas, or feelers, are slender and end in little knobs. Moth antennas lack these knobs. They often look like tiny feathers or threads. In addition, butterfly wings are usually brightly colored or boldly patterned. Most moths have a duller color than butterflies do.

Behavior

Most butterflies are active during the daytime, while moths generally are active at night. Nearly all butterflies and moths eat plants. The adults of many species drink a sweet liquid called nectar from flowers. As they feed, a substance called pollen rubs off on them. When they move to the next flower the pollen falls onto that flower. The pollen helps the flowers produce seeds.

Some butterflies and moths travel long distances to reach their breeding grounds. In autumn the monarch butterflies of North America fly nearly 2,000 miles (3,200 kilometers) to the south. In the spring they breed and then travel back north. This pattern of travel is called migration.

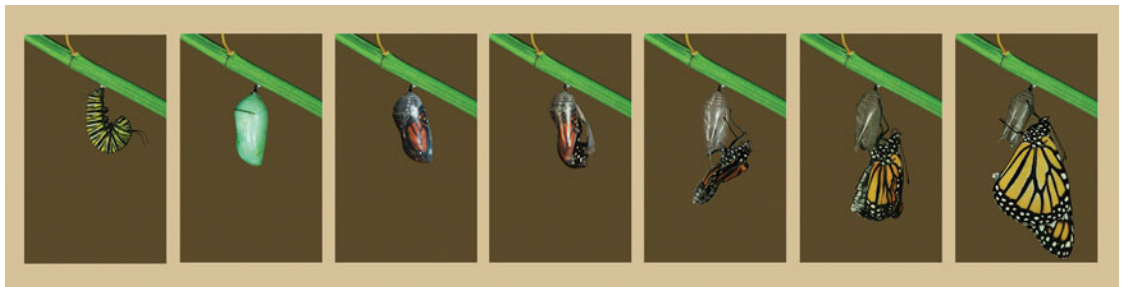

Life Cycle

Butterflies and moths change form completely over the course of their lives. This change is called metamorphosis. First, they hatch from an egg as a larva, or caterpillar. Caterpillars have no wings, and they often look like fat worms. Some kinds are hairy.

After a period of growth, the caterpillar changes into a form called a pupa. The pupa lies inactive for weeks or months while its adult features develop. Some species make a silk case called a cocoon to protect themselves during this resting stage. In fact, people get silk from the cocoons of certain moth caterpillars, called silkworms. Finally, the butterfly or moth becomes a winged adult.

► More to explore

Insect • Metamorphosis • Pollen • Silk

All butterflies and moths start out as caterpillars. Some, such as the monarch butterfly, form a cocoon to protect themselves as they become a pupa. When they are fully grown they come out of the pupa as an adult butterfly.

Byzantine Empire

The Byzantine Empire is known for its art. A mosaic showing the Empress Theodora is in the San Vitale Basilica in Ravenna, Italy.

The Roman Empire ruled a large part of Europe and northern Africa for hundreds of years. But in AD 395 it split into two parts. Invaders conquered the western part in 476. The eastern part became known as the Byzantine Empire and lived on until 1453. Its name came from the ancient city of Byzantium (now Istanbul, Turkey). This city, under the name of Constantinople, was the capital of the Byzantine Empire.

Culture

At its largest size, the Byzantine Empire extended from the Middle East to southern Spain. It included parts of southern Europe and northern Africa around the Mediterranean Sea. The people of this large empire developed a

unique culture. They made colorful pictures, called mosaics, out of broken bits of stone. They built buildings with large domes. They also replaced the Latin language with Greek.

In addition, the Byzantines created a new branch of Christianity. In 1054 the Byzantine church separated from the Christian church in the west. The western church became known as Roman Catholicism. The Byzantine church became known as Eastern Orthodoxy.

Rule of Justinian

Many emperors ruled the Byzantine Empire. One of the greatest was Justinian I. He ruled from 527 to 565. During his reign he expanded the empire and built many monuments, including a church called the Hagia Sophia. He also gave his people a famous code, or collection of laws.

Challenges and Decline

From the beginning, the Byzantine Empire faced many invasions. In the early years, groups from Europe threatened the empire's borders. The early Byzantines also fought Persians from Asia and Muslims from Arabia.

During the 1300s, Muslim Turks conquered the lands surrounding Constantinople. In 1453 the Turks captured the city. They made it the capital of the Ottoman Empire. With that the Byzantine Empire came to an end.

Cabbage

The group of plants called cabbages includes a number of familiar vegetables. Among them are head cabbage, broccoli, cauliflower, brussels sprouts, kale, and collard. All kinds of cabbage developed from the same plant, called wild cabbage. They are grown in mild climates throughout the world.

Cabbage plants have leaves with a waxy coating. This coating usually gives the leaf a gray-green or blue-green color. The flowers have two petals and two petal-like parts called sepals. The petals and sepals are arranged in opposite pairs in the form of a cross. The flowers grow in loose clusters at the top of the stem.

Cabbages can be grouped according to the parts that are used for food. In some

forms the leaves are eaten. These include kale, kohlrabi, head cabbage, and brussels sprouts. Kale and kohlrabi have loose leaves that spread outward from a stem. In the case of kohlrabi the stem is also eaten. Head cabbage has tightly folded leaves that form a single large head around a stem. Brussels sprouts are like head cabbages but are much smaller. Many brussels sprouts grow along a stem. Other cabbages, such as cauliflower and broccoli, have thickened flowers that are eaten.

Cabot, John

After the news of Christopher Columbus' famous trip to the Americas reached England, King Henry VII sent John

A picture shows John Cabot claiming what is now Canada in the name of King Henry VII in 1497.

Cabot to seek new lands for the English. Cabot reached North America in 1497. His landing led England to claim what is now Canada.

Like Columbus, John Cabot was born in Genoa, in what is now Italy, in about 1450. His original name was Giovanni Caboto. By 1461 Cabot had moved to Venice, Italy. During the 1470s Cabot sailed to the eastern part of the Mediterranean Sea as a trader. He visited Mecca, a great trading center in Arabia.

By 1495 Cabot was living in Bristol, England. He believed that he could find a short route to Asia. His plan was to sail north and west across the Atlantic Ocean. In 1496 King Henry VII agreed to the trip. Bad weather, food shortages, and conflicts with his crew forced Cabot to turn back.

The next year Cabot sailed again with a crew of 18 men on the small ship *Matthew*. On June 24, 1497, the men reached North America. They explored the coast of what is now Canada, in

either Newfoundland and Labrador or Nova Scotia. The ship may also have reached what is now the U.S. state of Maine. In August 1497 Cabot returned to Bristol.

The next year the king sent Cabot on another trip. Cabot thought that he could reach Japan by sailing south along the coast he had found. Cabot left England with five ships. One ship stopped in Ireland. The other four ships never returned. Cabot may have reached North America again, or he may have died at sea.

Cactus

Cactuses, or cacti, are desert plants. They grow in dry places where other plants have trouble living. Their ability to store water keeps them alive. Cacti are

There are several different varieties of barrel cactus. In general they have strong, stiff spines and prominent ribs.

A type of cactus known as the Engelmann prickly pear commonly grows in the southwestern United States.

also protected by sharp spines, or needles. These discourage animals from eating them.

Where Cacti Grow

There are about 1,650 species, or types, of cactus. These plants grow mainly in the dry areas of the United States, Mexico, Central America, and South America. Mexico has the greatest number and variety of cacti.

Physical Features and Growth

Cacti are succulent plants. This means that they have thick tissues that take up and hold large amounts of water. The stored water keeps them alive during dry periods. Unlike many plants, cacti do not have deep roots. Instead they have roots that spread out near the surface of the soil. This is important to their survival. These roots absorb water

from a wide area during the few times it rains.

Cacti are known for their pointy spines. These grow in different patterns on the plant's surface. Some cacti also have flowers and branches. Most do not have leaves. If a cactus has leaves, they are very small and fall off as the plant grows.

Cacti come in many sizes. The cactus called the prickly pear grows in low bunches. The giant cactus known as the saguaro can be 50 feet (15 meters) tall. Its branches may be 2 feet (about 0.6 meter) thick.

Most cacti grow in the ground. Some cacti, known as epiphytes, grow on plants. Others may grow on hard things such as rocks.

Uses

Cacti are often grown for decoration. Many unusual and beautiful varieties are prized as houseplants. In South America cacti are sometimes used as fences. The U.S. state of Arizona has adopted the saguaro as its state flower.

Some types of cacti are also grown for food. The egg-shaped fruit of the saguaro can be eaten. People also eat the fruit of the prickly pear.

Caddo

The Caddo were a group of about 25 Native American tribes that originally lived in the area that is now the U.S. states of Louisiana, Texas, Arkansas, and

The Caddo people made this small human figure in the early 1800s.

Oklahoma. They built their villages on fertile lands along the Red River.

The Caddo got most of their food by farming. They grew corn, pumpkins, squash, and beans. They also used bows and arrows to hunt deer, bear, and small game animals. They lived in dome-shaped houses made from grass stuffed into a wooden frame.

In the 1540s the Caddo welcomed Spanish explorers into their territory. Spanish and French traders visited regularly by the early 1700s. The Caddo traded their corn to other tribes for animal furs. They then gave the furs to the French in exchange for European goods.

As more and more non-Indians arrived, the Caddo began to lose their lands. By the mid-1800s they fled to Indian Territory (now Oklahoma). There they settled on a reservation along the

Washita River, which they shared with the Wichita Indians.

By the end of the 20th century, there were about 3,000 Caddo in the United States. Many lived in tribal lands in Oklahoma.

Caesar, Julius

The general and dictator Julius Caesar helped to build ancient Rome into a mighty empire. The name Caesar became the Russian word tsar and the German kaiser. Both mean “emperor.”

Julius Caesar was born on July 12 or 13, in about 100 BC. His father died when Caesar was 16. Caesar’s family was patri-

Julius Caesar was a leader of ancient Rome. He built a mighty empire. This marble bust of Caesar is in the Capitoline Museum in Rome.

cian, or upper class, but they supported the common people in politics.

Rise to Power

Caesar studied public speaking and later entered politics. In 59 BC he was elected consul, the highest public office in ancient Rome. As one of two consuls, he ruled the Roman state for one year.

He then left Rome to govern a Roman province in Gaul (modern France). In nine years of fighting he brought all of Gaul under Roman rule.

Dictator of Rome

Caesar returned to Italy in January of 49 BC and made himself dictator. Five years of civil war between Caesar's forces and the supporters of the popular general Pompey followed. Pompey fled to Egypt and died there before Caesar could catch him. But Caesar continued to fight and win battles against Pompey's supporters.

When he returned to Rome, Caesar pardoned his old enemies and gained many supporters. Not everyone trusted Caesar, however. Many wanted Rome to be a republic governed by a group of people rather than a dictatorship led by one man alone.

Sixty senators agreed to a plan to kill Caesar on March 15 (the "Ides of March" in the Roman calendar), 44 BC. Among them was Caesar's friend Marcus Junius Brutus. As he died, Caesar said, "*Et tu, Brute?*" ("You too, Brutus?").

Cairo

Population
(2006 estimate), city, 6,759,000;
(2005 estimate), urban area, 11,128,000

Cairo is the capital of Egypt, a country in northeastern Africa. It is the largest city in Africa. Cairo has long been the cultural center of the Arab world.

Places of Interest

Two areas, new and old, make up Cairo. Modern Cairo faces the Nile River. It includes the central business district and newer living areas.

In Cairo's oldest areas many people live in crowded conditions. Many ancient monuments are found there. The City of the Dead is a large section of historic cemeteries along the edge of the city. Thousands of poor people live among the tombs there. The Great Pyramids at Giza lie along the outskirts of Cairo.

Economy

Cairo has long been an important trading center. Factories in the city make cotton, processed foods, paper, cigarettes, and many other products. Most of Egypt's important banks, shipping companies, airlines, and hotels are in Cairo. The city's museums and monuments attract many tourists.

Did You Know?

The ancient Romans named the month of July in honor of Julius Caesar.

Modern Cairo's blocks of apartments, office buildings, and shops line the Nile River.

History

People have lived in the area around Cairo for thousands of years. In AD 969 Egypt's rulers at the time established a new city. It was later named Cairo.

In the 1200s Cairo became the capital of a large Muslim empire. The city thrived as a center of trade and Islamic learning and culture. Most of Cairo's greatest buildings went up during that period. After other rulers took over in the 1500s the city went into a period of decline.

In the 1860s many European-style buildings were built in new city districts. In 1922 Egypt became an independent country with Cairo as its capital. Since then the city has grown and grown.

Calendar

A calendar is a tool used to mark the passing of time. People of ancient times

based their calendars on the most obvious regular events they knew—the changing positions of the sun, moon, and stars. These calendars helped them figure out when to plant and harvest their crops. Over time different groups of people developed other calendars based on their own needs and beliefs.

Days, Weeks, Months, and Years

Several units of time are common to almost all calendars. The day is the most basic unit. The day measures the cycle of daytime and nighttime. It is now known to be the length of time that Earth takes to spin once on its axis. A group of seven days is called a week.

The month is about $29 \frac{1}{2}$ days long, the time taken by the Moon to orbit Earth. The year is about $365 \frac{1}{4}$ days long. That is the time taken by Earth to orbit the sun. The year measures the seasons.

Fitting months into years is a problem for calendar makers. The difficulty comes from the fact that the month is lunar, or based on the Moon, but the year is solar, or based on the sun. Twelve cycles of the Moon take about 354 days, not $365 \frac{1}{4}$. To make the lunar months fit into the solar year, it is necessary to add days at certain times. This is why calendar months differ in length. All except February are longer than 29 days to make up for the extra 11 days of the solar year. For the same reason a day is added to February every fourth year. These are called “leap years.”

Did You Know?

Unlike the day, the month, and the year, the week is not based on any astronomical event.

Early Calendars

The Sumerians of ancient Mesopotamia (now Iraq) used a calendar of 12 lunar months. They added an extra month about every four years. This calendar served as a model for early Greek and Jewish calendars.

The early Egyptians also used a calendar based on the Moon. Later, though, the Egyptians worked out a calendar that corresponded almost exactly to the seasons.

The early Romans had a lunar year of 355 days. To make the lunar year agree with the solar year, priests added extra months. The calendar became increasingly out of phase with the seasons.

Julian and Gregorian Calendars

In 46 BC, the Roman ruler Julius Caesar decided on the figure of 365 $\frac{1}{4}$ days for the length of the year. Every fourth year had 366 days. This calendar was named “Julian” after its creator. It had the 12 months at the lengths used today.

The Julian year was still slightly longer than the solar year, however, and problems arose as the centuries passed. In 1582 Pope Gregory XIII ordered 10 days to be dropped from the year. To keep the calendar correct in the future, Gregory ordered that leap year should be skipped three times in every 400 years. His system is called the Gregorian calendar. It is now used almost everywhere outside the Islamic world.

Native American Calendars

The Maya and the Aztec had the best Native American calendars. Their calendars each had a cycle of 260 named days related to their religious rituals and a year of 365 days. The year was divided into 18 months of 20 days each, with five days added to fill out the years.

Other Calendars

Several calendars other than the Gregorian calendar are still in use. The Muslim calendar, for example, is used by most Arab countries. It is a lunar calendar with 12 months of 30 or 29 days that add up to a year of 354 or 355 days.

The Chinese calendar is still used along with the Gregorian calendar in China, Taiwan, and neighboring countries. The traditional Hindu and Jewish calendars continue to be used as well for religious purposes.

Did You Know?

Great Britain and its colonies lost 11 days when they switched from the Julian to the Gregorian calendar in 1752. The day after September 2 was September 14.

A Jewish calendar from the 1800s is written in Hebrew.

California

More people live in California than in any other U.S. state. About one eighth of the country's entire population lives in the state. California even has more residents than about half of the world's countries. The state's name is believed to have come from a Spanish novel of the 1500s that described a fabled place called California. The nickname of the Golden State comes from the golden poppies that grow in California and from the gold that was found there in the mid-1800s. Sacramento is the capital.

Geography

California is one of the country's largest states in area; only Alaska and Texas are bigger. It borders Nevada and Arizona on the east, Oregon on the north,

Mexico on the south, and the Pacific Ocean on the west.

California's landscape is varied, with mountains, valleys, forests, seacoasts, and deserts. The Klamath Mountains are in the state's northwest corner. To their east is the southern part of the Cascade Range. The Sierra Nevada is a wall of mountains in the east-central part of the state. The Central Valley runs north to south between the Sierra Nevada on the east and the highlands of the Pacific Coast Ranges. Most of eastern California is desert. The largest desert in the state, the Mojave, is in the southeast.

California's climate differs by location. The climate along the Pacific coast is generally mild. The Central Valley has hot summers and mild to cool winters. The mountains have short summers and cold winters. The southeastern desert is very hot and dry.

People

The majority of California's people are of European descent, but the state's minority groups are large. More than one fourth of California's residents were born outside the United States. Mexicans are the largest foreign-born group by far. People from the Philippines, China (including Hong Kong and Taiwan), Vietnam, and El Salvador are other large groups. Mexicans and other Hispanics make up about one third of California's population. African Ameri-

The scenic coastline of Big Sur stretches for 100 miles (160 kilometers) along the Pacific Ocean in California.

cans make up more than 6 percent. California's Native American population, numbering more than 330,000, is the largest in the country.

The largest clusters of people are in the south, around Los Angeles and San

Diego, and in the San Francisco Bay Area. Los Angeles is the largest city in the state and the second largest city in the country. Bay Area cities include San Francisco, Oakland, and San Jose.

Economy

California's economic production ranks first among the 50 states. If California were a country, it would have one of the world's largest economies. Services account for about three fourths of the state's economy. Service-related jobs include workers such as actors, social workers, government employees, schoolteachers, doctors and nurses, lawyers, and restaurant and hotel staff. Tourism is an important service industry. Each year it contributes about 75 billion dollars to the state's economy.

The Golden Gate Bridge connects San Francisco to Marin County. It is between San Francisco Bay and the Pacific Ocean.

California manufactures automobiles, aircraft, ships, military supplies, electrical equipment, and chemicals. California also has many food-processing plants and publishing and printing industries. A region known as Silicon Valley, in the San Francisco Bay Area, is home to much of the country's computer industry. The motion picture industry is centered in the Los Angeles area.

California's farms are the most productive in the country. The dozens of crops grown include grapes for eating and winemaking, citrus fruits, and nuts. Dairy farms produce milk, cheese, and other products.

History

Native Americans of the Shasta, Pomo, Miwok, and Chumash tribes lived along the Pacific coast of what is now California long before Europeans arrived. The Mojave lived in the southeast and the Yokut in the Central Valley.

Spaniards were the first Europeans in California. Juan Rodriguez Cabrillo claimed the land for Spain in 1542. In 1602 Sebastián Vizcaíno explored the coast and gave many places their present names. In 1769 two Spanish priests founded a mission called San Diego de Alcalá. During the next 50 years 20 more missions were established along the coast. Towns and large ranches grew around the missions.

Between the 1820s and the 1840s Mexico and the United States competed for California. Mexico owned the territory and refused to sell it to the United

States. In 1846 Californians around Sonoma, near San Francisco, rebelled against Mexican rule and joined the United States in fighting the Mexican War. The peace treaty that ended the war in 1848 gave California and other Mexican land to the United States.

Early in 1848, before the treaty was signed, gold had been discovered near Coloma, in northern California. This find started a gold rush. The arrival of tens of thousands of gold hunters called forty-niners (because many of them arrived in 1849) changed California. The population surge helped lead to statehood for California in 1850.

Many more people came to California after railroad service from the eastern United States began in 1869. During the Great Depression of the 1930s thousands of homeless farm families moved to the state hoping to earn a living. During World War II (1939–45) California's industries, such as aircraft plants and shipyards, greatly expanded. Many people moved to the state for work and stayed after the war.

In the early 21st century California continued to attract new residents, including many from Mexico. The state had to deal with issues such as creating affordable housing and educating people from many different backgrounds.

Caliphate

The Caliphate was the name of the lands ruled by Muslims from AD 632 to 1258. The leaders of Islam after the prophet Muhammad had the title of caliph, which means “successor” in Arabic. The caliphs built an empire that stretched from India in the east to Spain in the west.

The First Caliphs

Islam began in the Arabian Peninsula in the early 600s. Muhammad, the founder of Islam, died in 632. Muslims then chose Abu Bakr to lead the Muslim community. He became the first caliph. He and the three caliphs who followed him—‘Umar I, ‘Uthman, and ‘Ali—were relatives of Muhammad.

Some Muslims rebelled against ‘Ali. This brought about a split in Islam that still exists today. The followers of ‘Ali became the Shi‘ite branch. The followers of Mu‘awiyah I, who was ‘Ali’s main opponent, became the Sunnites.

The Umayyad Caliphate

By 661, Mu‘awiyah had become the first of a line of caliphs called the Umayyads. Under their rule, Muslim armies took over North Africa and most of the Iberian Peninsula (now Spain and Portugal) in Europe.

Eventually, some Muslims rebelled against the Umayyads’ rule. Forces of the ‘Abbasid family defeated the last Umayyad caliph in battle in 750.

The ‘Abbasid Caliphate

The ‘Abbasid family started a new line of caliphs. The early ‘Abbasid caliphs supported trade, the arts, and the sciences. One caliph, called al-Ma’mun, tried to make peace with the Shi‘ites but failed.

The ‘Abbasids turned their attention away from the area around the Mediterranean Sea. Instead, they looked eastward and made Baghdad (in what is now Iraq) their capital. They also took on many soldiers from non-Arab peoples, particularly the Turks.

An Umayyad caliph is pictured on a gold coin from the 600s.

End of the Caliphate

The Buyids of Persia (now Iran) conquered the 'Abbasids in 945. The Seljuq Turks took over in 1055. The caliph became mainly a religious leader. Mongol raiders killed the last real 'Abbasid caliph in Baghdad in 1258. After that, people first in Egypt and then in the Ottoman Empire (centered in Turkey) claimed to be caliphs. However, most Muslims did not recognize their power.

Calligraphy

Calligraphy is the art of beautiful handwriting. Artists who create calligraphy are called calligraphers. They often use a special pen or a brush to make their art.

Calligraphy in Europe

Writing first developed more than 5,000 years ago. It was not until about the 500s BC, however, that some people began to use writing as a kind of decoration.

The Greeks were the first to use one kind of writing for everyday documents and another for more important texts. Later Europeans based their calligraphy on Greek and Roman styles.

Until about the 1400s few people knew how to write at all. Religious men called monks used calligraphy as they copied and decorated religious books. Students and professional copyists also knew how to write. Some used calligraphy while others used more simple forms.

By the 1400s many more people were learning how to write. In order to make writing a practical and easy skill, letters were simplified. At the same time the printing press was invented. This used simple letters that could be easily combined to print a page. Calligraphy lost importance until the late 1800s. Then it became a popular hobby.

Calligraphy in Other Cultures

In China people consider calligraphy to be a high art form, like poetry or painting. Chinese calligraphers use brushes with ink on silk or paper. They do not change the look of the characters (the symbols of the Chinese language) by adding decorations.

Hebrew calligraphy is one of the oldest forms of writing. It has kept its basic style for hundreds of years. Copies of the Torah (the Jewish holy writings) are written by hand in Hebrew calligraphy.

Arabic calligraphy has been an important art form in the Islamic world since the 600s. Arabic letters are easily linked

Did You Know?

People often hire professional calligraphers to write out wedding invitations or other special documents.

Calligraphy is an important art in Japan. Many Japanese schoolchildren enter calligraphy contests.

Calvin, John

The French religious thinker John Calvin was one of the leaders of the Reformation. Calvin and others wanted to change, or reform, the Roman Catholic church. Instead the Reformation led to the creation of a new branch of Christianity called Protestantism. This became one of the three major branches of Christianity.

Calvin was born on July 10, 1509, in Noyon, France. He studied religion and law during the 1520s. He also became involved in the movement to reform Roman Catholicism. The Catholic

John Calvin was one of the first leaders of the branch of Christianity called Protestantism. He stressed faith in God above all else.

church encouraged people to do good works and to perform rituals in order to get to heaven. But the reformers thought that God alone decided who went to heaven, and not because of their actions.

In 1533 Calvin moved to Switzerland, where he studied religious ideas, especially those of a German priest named Martin Luther. Like Luther, Calvin began to reject Roman Catholicism. Calvin began writing down his new Protestant beliefs. He published these beliefs in a book, which inspired many people to become Protestants.

Calvin became well known and moved to Geneva (now in Switzerland). He worked with other leaders to make this city-state into an important center of Protestantism. Calvin also eventually convinced Geneva's leaders to follow his ideas about government. He thought that governments should make laws based on religious beliefs.

Calvin died in Geneva on May 27, 1564. After his death his followers, called Calvinists, spread his ideas across Europe. In the 1600s some English Calvinists brought Calvinism to North America. Today many people view Calvin as the founding father of several Protestant churches, including the Reformed and Presbyterian churches.

Cambodia

The Royal Palace in Phnom Penh, Cambodia, is built in the traditional Cambodian style.

The Southeast Asian country of Cambodia has long served as a battleground between various countries and political groups. The capital is Phnom Penh.

Geography

Cambodia is bordered by Laos, Thailand, and Vietnam. The Gulf of Thailand lies to the southwest. A low-lying plain covers central Cambodia. In the east the Mekong River runs through highlands. The Tonle Sap (Great Lake) and mountains lie in the west. Cambodia has a tropical climate with a rainy season and a dry season. In the lowlands temperatures rarely drop below 80° F (27° C).

Plants and Animals

Dense forests cover two thirds of Cambodia. Tall evergreen trees, bamboo,

vines, and palms grow in the northern mountains. The southwestern highlands contain pine forests in the higher regions and rain forests near the sea. Rice paddies, fields of crops, and grasslands cover the central plain.

Cambodia's northern forests contain elephants, wild oxen, rhinoceroses, tigers, and leopards. The birds native to Cambodia include herons, pelicans, cormorants, and pheasant. The country also has crocodiles and cobras.

People

The Khmer ethnic group makes up about 85 percent of the population. Chinese, Vietnamese, and Cham people also live in Cambodia. Buddhism is the main religion. Many rural people also follow ancient folk religions. More than 80 percent of the population lives in rural areas.

A woman in Cambodia works in a rice paddy. A paddy is a type of wet farmland.

Facts About CAMBODIA

Population
(2008 estimate)
14,242,000

Area
69,898 sq mi
(181,035 sq km)

Capital
Phnom Penh

Form of government
Constitutional monarchy

Major urban areas
Phnom Penh, Bat Dambang, Siso-phon, Siem Reab, Preah Sihanouk

Economy

About 70 percent of Cambodians are farmers. The main crop is rice. Other crops include cassava, corn, sugarcane, bananas, coconuts, oranges, rubber, soybeans, and tobacco. Cambodians also fish and raise livestock, including cattle, pigs, and buffalo.

Trade and manufacturing are important parts of the economy. Cambodia's main products are clothing and textiles, leather, foods, rubber goods, and logs.

History

People have lived in what is now Cambodia for at least 6,000 years. The most famous of Cambodia's ancient kingdoms was the powerful Khmer Empire. The Khmer ruled much of Southeast Asia from the AD 800s to the 1200s. They constructed the famous temples of Angkor Wat in the 1100s. In the 1300s and 1400s the neighboring Tai peoples invaded, and Cambodia lost

much of its territory. In the 1800s Thailand and Vietnam further divided the country.

In the late 1800s France took control of the region. The French merged Cambodia with Vietnam and Laos to create the colony of French Indochina. France granted Cambodia its independence in 1953.

During the 1960s and 1970s the Vietnam War spilled over into Cambodia. In 1975 a group of Communists known as the Khmer Rouge seized control of the country. Led by a man named Pol Pot, the Khmer Rouge killed anyone who opposed the new government. At least 1 million Cambodians died in what came to be known as the "Killing Fields."

In 1978 Communist forces backed by Vietnam invaded Cambodia and toppled the Khmer Rouge government. They set up a new government and changed the name of the country to Kampuchea. Khmer Rouge rebels continued to fight the government.

Vietnam pulled out of the country (once again known as Cambodia) in 1989. In 1993 a new Cambodian government banned the Khmer Rouge. However, the rebels did not stop fighting until Pol Pot died in 1998. Although the civil war was over, political quarrels and violence continued.

Camel

Camels are large mammals that live and work in several of the world's deserts. They are known for their humps. The Arabian camel, or dromedary, has one hump on its back. The Bactrian, or Asian, camel has two humps. Camels belong to the same family as the llama and the alpaca.

Where Camels Live

The Bactrian camel lives in the highlands of central Asia. Most Bactrian camels are domesticated, or tamed to help humans. Small herds of wild Bactrians live in Mongolia and northwestern China.

The Arabian camel lives mainly in North Africa, the Middle East, and India. There are no wild Arabian camels left in these places. However, herds of wild Arabian camels now live in Australia. They are the descendants of tame

The Bactrian camel is also called the Asian camel. It has two humps.

The Arabian camel is also known as a dromedary. It has only one hump.

camels that people brought to Australia in the 1800s.

Physical Features

Camels weigh up to about 1,400 pounds (650 kilograms). They are about 7 feet (2 meters) tall at the hump. The hump is made of fat and muscle. Camels have a long neck, a small head, and a split upper lip. Long eyelashes protect the eyes from sandstorms and glaring sun. The nostrils can close to keep out blowing sand. Camels stand on four long legs. Each foot has two hoofed toes. A scruffy, sand-colored coat of hair covers the body.

Behavior

Camels are well adapted to living in deserts. They feed on thorny plants, shrubs, and dried grasses. They can go for days or even months without water. If a camel goes without food and water, the fat in its hump can nourish it for several days. The hump then becomes limp and leans to one side or disappears altogether.

Did You Know?

The first camels lived in North America about 40 million years ago. They died out in North America after spreading to other continents.

Uses

Desert peoples ride on camels and use them to carry loads. Camels can carry up to 1,000 pounds (450 kilograms). Desert peoples also drink camel milk and eat camel meat. They make tents, blankets, rugs, clothing, and rope out of camel hair. Dried camel droppings are useful as fuel for cooking fires.

Camera

A camera is an instrument used to take, or record, pictures of people and objects. Some cameras record single, still pictures called photographs. Movie cameras and video cameras record moving pictures. These are called movies, films, or videos.

The word camera comes from the Latin words *camera obscura*, which mean “dark chamber.” This is because the earliest experiments with capturing images took place in a darkened chamber, or room.

How a Camera Works**Traditional Cameras**

A traditional camera is a lightproof box. The box contains an aperture, or opening, that lets light in for a certain amount of time. A part called a shutter opens and closes the aperture. This controls the amount of light coming into the camera.

Light from an object, or subject, passes into the camera through one or more lenses. The lenses focus the light onto

The lens in a digital camera focuses light from an object, or subject, onto a light sensor inside the camera. The sensor turns the light into electric signals that represent the image.

film stored in the camera. The chemically coated film reacts to the light and records an image, or picture, of the object. Photographers then remove the film from the camera. With special chemicals, they use the film to make prints of the image on paper.

There are many types of traditional cameras. Some are fully automatic. This means that the camera focuses and allows in the right amount of light to take a good picture. The photographer needs only to aim the camera and press a button. Other cameras allow the photographer to make these adjustments by hand. They give the photographer more control over the way the pictures look.

Digital Cameras

A digital camera works in a similar way as a traditional camera. However, it captures the image on an electronic chip rather than on film. The chip is a light sensor that turns the image into electric signals. Most digital cameras have a small screen that displays the image right away. The camera can also store the image on a memory card. Photographers can transfer the stored image to a computer. This allows them to view, e-mail, or print out the image.

Movie and Video Cameras

Movie cameras are like traditional cameras, but they record moving images. They do this by taking many still pictures in a row—usually 24 or 30 each second. They record images on a reel of film. When a movie projector shows the pictures on the film one after the other, the images appear to be moving. Video cameras, or camcorders, record moving images on magnetic tape. Digital camcorders store moving images as electric signals.

History

In ancient times people used a camera obscura to view eclipses of the sun. They stood in a small, dark room that had only a tiny hole to let in light. An upside-down image of the scene outside appeared on the wall across from the hole. Later, people made portable boxes that worked like the ancient camera obscura. A mirror reflected the image outside the box and onto a screen.

In 1837 a Frenchman, Louis Daguerre, found a way to record the images made by a camera obscura on metal plates. These pictures were called daguerreotypes. Around the same time an Englishman named William Henry Fox Talbot used a similar box to record images on paper. These men had created the first modern cameras.

In the late 1800s the U.S. inventor George Eastman made a camera that brought photography to the general public. Before this time cameras were heavy, complicated, and expensive. Eastman's camera was small and easy to use. People simply pushed a button to take pictures and then sent the film to Eastman's factory to be printed.

The U.S. inventor Thomas Edison and the French Lumière brothers developed movie cameras in the late 1800s. Digital cameras did not appear until the 1990s.

Cameroon

The West African country of Cameroon takes its name from the Rio dos Camarões (River of Shrimps), the name the Portuguese gave to the Wouri River. The capital is Yaoundé.

Cameroon is bordered by Nigeria, Chad, the Central African Republic, Republic of the Congo, Gabon, and Equatorial Guinea. The Atlantic Ocean lies to the west. Mountains run through the north and west. The country has hot temperatures year-round.

Rain forests are in the south. Mangroves grow along the coasts and rivers. Monkeys live in the forests. Elephants, baboons, and antelope live in the wooded grasslands of the north.

The ethnic groups of Cameroon include the Fang, the Bamileke, the Duala, and the Fulani. English and French are the official languages, but people speak many other languages. The majority of the

People gather to buy and sell goods at a market in Maroua, Cameroon.

people follow Christianity or traditional religions. The north is mostly Muslim.

Cameroon's economy is based on farming. The main crops include cassava, sugarcane, corn, bananas, and sorghum. The country also produces petroleum (oil), lumber, and cocoa for export.

Humans have lived in what is now Cameroon for at least 50,000 years. Eventually Bantu people settled in the south and the west, and the Fulani settled in the north. In the 1470s the Portuguese established sugar plantations and a slave trade. Germany gained control in the late 1800s. After World War I Cameroon was divided into French and British zones. In 1960 the French zone became the independent republic of Cameroon.

Canada

Banff National Park is in southwestern Alberta, along the Canadian Rocky Mountains.

Canada is the largest country in the world after Russia. The country is divided into 10 provinces and three territories. The capital is Ottawa.

Geography

Canada lies north of the United States in North America. The U.S. state of Alaska sits on its northwestern border. The Pacific, Atlantic, and Arctic oceans form the rest of its borders.

Canada's largest natural region is a rocky, mostly flat area that covers the eastern, central, and northwestern parts of the country. In the west, plains stretch from the Arctic Ocean to the U.S. border. The Mackenzie, Canada's longest river, drains the northwest. West of the plains are the Canadian Rocky Mountains. Along the Pacific are the Coast Mountains. In the south and southeast,

lowlands border the Great Lakes and Saint Lawrence River.

Because of its size, Canada has great variety in its climate. Most regions have very cold and long winters. Temperatures are most moderate along the Pacific coast.

Plants and Animals

One of the largest evergreen forests in the world stretches from Alaska to Canada's Atlantic coast. In the south, the evergreens are mixed with maple, beech, red oak, and white ash trees. In the far north is cold land known as tundra, where only mosses, lichens, and low shrubs grow.

Many of Canada's wild animals live in the northern forest. Among them are moose, beavers, Canada lynx, black bears, wolves, and snowshoe hares. Seals, polar bears, caribou, white foxes, and snowy owls live in the tundra. The animals of the plains include deer and antelope. Fish are plentiful in Canada's waters.

People

Nearly half of the people in Canada have British ancestors, and almost one fourth have French ancestors. Smaller groups of people descended from other European, Asian, or U.S. immigrants. There are also small groups of American Indians and Inuit, as well as Métis (people with both Indian and European

ancestors). Both English and French are official languages.

About three fourths of Canadians are Christians. About one sixth of Canadians follow no religion. The country also has small groups of Muslims, Jews, Hindus, and people of other faiths.

Most people live in cities and towns in the south. The largest city is Toronto, Ontario, Canada's business center. The second largest city is Montreal, Quebec. It is a major seaport and one of the biggest French-speaking cities in the world. Vancouver, British Columbia, is Canada's third largest city.

Economy

The economy of Canada is based on manufacturing and businesses that serve the public. Among the many service industries are finance, health care, education, and tourism. The most valuable manufactured goods include chemicals, electronic products, metals, and wood and paper goods. Canada is also a leading producer of petroleum (oil), natural gas, and minerals.

Canada is one of the world's top food producers. It is known for its grains, especially wheat, and oilseeds. Pigs and cattle are the most important livestock. Fishers catch salmon, herring, cod, and other fish in Canada's waterways.

People eat outside at a restaurant in Montreal, in the Canadian province of Quebec.

History

Early Peoples and Exploration

For thousands of years, Inuit lived in the north and American Indian peoples lived in the south of what is now Canada. Vikings from northern Europe arrived in what is now Newfoundland in about 1000 AD. The Vikings did not stay in Canada, however.

In 1497 the Italian explorer John Cabot landed in eastern Canada. Others soon

followed. In 1534 a French explorer, Jacques Cartier, entered the Gulf of Saint Lawrence in what is now Quebec. He claimed the area for France.

New France

In 1608 Samuel de Champlain founded the city of Quebec, France's first permanent Canadian colony. The French soon set up more settlements in the region, which they called New France.

Meanwhile, the British also became interested in the region. In 1670 the English started Hudson's Bay Company, which built trading posts around Hudson Bay. Over the next century Great Britain and France fought wars over the land. After defeating France in the French and Indian War in 1763, Britain took control of Canada. They made New France into the colony of Quebec.

Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick, and Quebec. Britain divided Quebec into Upper and Lower Canada in 1791.

In the mid-1800s people began to call for a union of these colonies. In 1867 Nova Scotia, New Brunswick, and Upper and Lower Canada (now the provinces of Ontario and Quebec) formed the Dominion of Canada. Canada now had its own federal government, although Britain kept some control.

Westward Expansion

The population of Canada increased quickly during the 1800s. As settlers moved westward, new provinces and territories were created. Many native peoples lost their land and moved to reserves.

The provinces of Prince Edward Island, Manitoba, Saskatchewan, Alberta, and British Columbia, as well as Yukon and the Northwest Territories, joined the country by the 1930s. The province of Newfoundland joined Canada in 1949.

Independence

In 1982 the British Parliament granted Canada control over its constitution. This made Canada an independent country though it kept ties to Britain.

Beginning in the 1960s many French Canadians in Quebec called for separation from Canada. They wanted to create a French-speaking nation. In 1995 the people of Quebec narrowly voted against separating from Canada. Some French Canadians continued to call for separation, however.

In the 1990s many native people asked the Canadian government to return their land to them. Canada responded by creating Nunavut, a self-governing homeland for the Inuit, in 1999. The new territory was formed from the eastern part of the Northwest Territories.

Canada Day

Canada Day is the national holiday of Canada. It is celebrated on July 1. On that day in 1867 Canada became a country.

In 1867 four of Great Britain's North American colonies joined together as a new country. It was called the Dominion of Canada. In 1879 a law made July 1 a holiday called Dominion Day. Canada gained complete independence from Great Britain in 1982. In the same year Canada changed the holiday's name to Canada Day.

Canadians celebrate Canada Day with parades, barbecues, picnics, and displays of fireworks. They also sing the national anthem, "O Canada." The most important celebration takes place in the area of Parliament Hill, in Canada's capital city of Ottawa. Members of Canada's national police force, the Royal Canadian Mounted Police, do horse riding

tricks. Part of the Royal Canadian Air Force puts on an air show.

Canal

Canals are waterways that are built by people and used for shipping, travel, and irrigation. Canals have been an important way to move goods and carry people for more than 5,000 years.

Some canals make it possible for boats to travel inland from oceans and lakes. A canal may also serve as a shortcut between two bodies of water. Other canals carry drinking water to cities or irrigation water to farms.

Building a Canal

To make a canal, builders dig a long channel in the ground and fill it with water. The water usually comes from a connecting river, lake, or ocean. Builders often line the canal with stone, concrete, or steel to make it stronger. The lining also prevents the water from leaking out.

Locks

Locks are an important part of many canals, especially in areas where the land is not completely flat. A lock is a stretch of canal blocked off at each end by strong gates. These gates can be opened or closed to allow water to fill or to drain from the lock.

Locks allow boats to travel between lower and higher areas of a canal. When

Did You Know?

The Saint Lawrence Seaway in North America includes several canals. They were built to open the Great Lakes to oceangoing ships.

Three young people celebrate Canada Day, the national holiday of Canada.

a boat enters a lock, the gates close behind it. Water then fills or empties from the lock through small openings called sluice gates. When the water in the lock reaches the level of the next part of the canal, the gates in front of the boat open. The boat then passes out of the lock.

Famous Canals

The world's oldest canal still being used today is the Grand Canal in China. It is also the world's longest canal, with a length of about 1,085 miles (1,747 kilometers).

The Erie Canal connects the Hudson River in New York with the eastern shore of Lake Erie, near Buffalo, New York. The Erie Canal was an important shipping route in the 1800s.

The Suez Canal in Egypt connects the Mediterranean Sea with the Red Sea. This major shipping canal is the shortest water route between Europe and the Indian Ocean.

In Venice, Italy, people travel on canals instead of roads.

Locks allow boats to travel between lower and higher areas of a canal.

The Panama Canal is an important shortcut between the Atlantic and Pacific oceans. Before this canal was built, ships had to travel around the tip of South America to get from one ocean to another.

In Venice, Italy, people use canals as roadways. In the oldest parts of the city, people travel by special boats called gondolas instead of cars. A gondola is pushed with a long pole.

Canary

The canary is a small bird known for its singing. Canaries are found wild in the Canary, Azores, and Madeira islands off the coast of northwestern Africa. Hundreds of years ago people caught these wild birds and began breeding them.

The canary is one of the most popular pet songbirds in the world.

Over time they have bred hundreds of different kinds of canaries that are sold as pets.

Several other small songbirds, such as the American goldfinch, are sometimes called wild canaries. But they are different types of birds. The canary is a species, or type, of songbird that is closely related to goldfinches, siskins, and redpolls. It is also related to other finches, cardinals, and sparrows.

In the wild, canaries measure about 5.5 inches (14 centimeters) in length. They are dull greenish brown with yellowish breasts. Pet canaries differ in size, form, feather color, and song. Breeders work to develop different characteristics in the different kinds of pet canaries. Many pet canaries have bright yellow feathers.

Canaries have short, cone-shaped bills. They use their bills to crack open seeds to get at the parts that are good to eat. They may also eat fruits.

Cancer

Cancer is a disease that causes certain cells in the body to grow out of control. The human body contains billions of

As a tumor grows larger, it invades the healthy tissues nearby. Cancer spreads when cells from a tumor travel to other parts of the body.

cells. Most of these cells reproduce, or duplicate themselves, over and over. The body normally controls this process. In some people, however, certain cells start to multiply too much. These cells are not normal. They produce clumps of tissue called tumors.

Some tumors are harmless, but others are very serious. They can destroy nearby healthy cells and organs. These destructive tumors are called cancer. Cells from these tumors sometimes spread to other parts of the body and form more tumors.

There are many different kinds of cancer. The kind of cancer a person has depends on where it starts to grow. It also depends on what causes it and how fast it grows.

Symptoms

There are some general symptoms, or signs, that may mean a person has cancer. These symptoms include pain, weight loss that cannot be explained, fever, tiredness, and changes in the skin. Each kind of cancer also produces specific symptoms. For example, a cough that will not go away could be a sign of lung cancer.

Causes

Scientists do not know why some cells multiply too quickly. However, they have discovered many things that can lead to cancer. Most cancers are caused by conditions outside the body. For example, getting too much sunlight can cause skin cancer. Smoking tobacco can cause lung or mouth cancer.

In addition, eating unhealthy foods and not exercising enough can lead to cancer. People have a higher chance of getting some kinds of cancer if members of their families had them. A few viruses also cause cancer.

Prevention

The easiest way to prevent cancer is to stay away from the things that might cause it. For example, doctors suggest that people wear sunscreen lotion when outdoors. Sunscreen lotion protects the skin from harmful rays in sunlight. Exercise and eating a lot of fruits, vegetables, and whole grains also can help to prevent cancer. Seeing a doctor once a year helps, too. Doctors can find early warning signs of cancer.

Treatment

If cancer is caught early, it often can be treated successfully. A doctor can remove tumors by surgery, or cutting them out of the body. Radiation (energy particles) and chemotherapy (chemicals) are also used in cancer treatment. These two processes either kill the cancer cells or stop them from growing.

Canyon

A canyon is a narrow, deep valley cut by a river through rock. Canyons vary in size. Some are narrow slits while others are huge trenches. Canyons have very steep sides and may be thousands

Over many years, Deer Creek has cut through rock to create a beautiful canyon in Grand Canyon National Park, Arizona.

of feet deep. Smaller valleys of similar appearance are called gorges.

Canyons are created by erosion. Over thousands or millions of years a river's flowing water erodes, or wears away, soil and rocks to form a valley. The largest and most famous canyons have been cut through dry areas by swift streams fed by rain or melting snow from wetter areas. The walls remain steep and rough because there is little rainfall or surface water to wear them down. An example is the Grand Canyon, in the U.S. state of Arizona.

Submarine canyons are deep underwater valleys. They are found along the borders of the continents and some ocean islands. The Grand Bahama Canyon, in the Atlantic Ocean near the Bahamas, is thought to be the deepest submarine

Plants grow on the walls and floor of a canyon in Iceland. Many famous canyons are found in dry regions, but canyons also may form in cool, wet areas.

Cape Town

Population
(2005 estimate)
3,103,000

The country of South Africa has three capitals—Cape Town, Pretoria (Tshwane), and Bloemfontein. Cape Town is where the country's legislature meets.

The legislature makes the country's laws. It is a large city in a beautiful natural setting.

Cape Town is one of South Africa's most important centers of industry. Factories in the city process foods and make wine, clothing, and leather goods. Other main industries include ship repair and tourism. Cape Town is also a seaport.

The first people to live in the region were ancestors of the African Khoisan people. Traders from the Netherlands founded a settlement at the site in 1652. It was the first European settlement in what is now South Africa. The company used the settlement as a supply station. In 1806 the British took control of the area. In the late 1800s the discovery of gold and diamonds nearby brought many more people to Cape Town. In 1910 the country of South Africa was formed with Cape Town as its legislative capital.

The city of Cape Town, South Africa, looks out onto the Atlantic Ocean.

Cape Verde

The town of Porto Novo, Cape Verde, is tucked into the mountains.

Cape Verde is an archipelago, or group of islands, in the Atlantic Ocean. Ruled by Portugal for 500 years, the country gained independence in 1975. Praia, on São Tiago Island, is Cape Verde's capital and largest city.

Cape Verde lies 385 miles (620 kilometers) west of Africa. It includes 10 islands and five rocky islets. The Windward, or Barlavento, Islands lie to the north of the Leeward, or Sotavento,

© 2006 Encyclopædia Britannica, Inc.

Islands. The islands are mountainous. The climate is warm and very dry.

Grasses and some pine trees grow on mountain slopes that face the wind, where there is more rainfall. The sheltered slopes are desertlike, with thorny shrubs. Many lizards, butterflies, and birds live on the islands. Sea turtles lay their eggs on the sandy shores. The long-eared bat is the only mammal native to Cape Verde.

More than two thirds of Cape Verde's population is Creole, or of mixed African and European roots. Most of the rest of the people are African. The official language is Portuguese, but most people speak a form called Crioulo. Most Cape Verdeans are Roman Catholics. Most live in towns or cities.

Trade and transportation bring the most money to Cape Verde's economy. Agriculture and manufacturing play smaller roles. Crops include corn, sugarcane, bananas, coconuts, and sweet potatoes.

No one lived in Cape Verde until Portuguese settlers landed on São Tiago in 1462. They used the islands in their African slave trade. In 1951 Portugal made Cape Verde a province. All the people of the islands gained Portuguese citizenship in 1961. In 1975 Cape Verde became an independent republic.

Capitalism

Capitalism is an economic system. That is, it is a system for dealing with money and wealth. In a capitalist country, citizens, not governments, own and run companies. These companies compete with other companies for business. They decide which goods and services to provide. They also decide how much to charge for the goods and services and where to sell them. Companies do all these things to make money for their owners. People who use their money to start or to run companies are called capitalists.

Many countries of the world—including the United States, Great Britain, Japan, and Germany—practice capitalism. Other names for capitalism are free-market economy and free enterprise.

Rise of Capitalism

Capitalism has existed since ancient times—for as long as people have bought and sold goods. However, it

In a capitalist economy, many different companies compete against one another for business. For example, many different companies make televisions for people to buy.

gained importance in the 1500s with the growth of trade, industry, and banking. During this time governments tried to encourage trade. To do this, countries behaved like merchants. They tried to sell more to foreign countries than they bought from those countries. This idea of profit (taking in more money than one pays out) helped modern capitalism to develop.

“Laissez-Faire” Capitalism

In the 1700s and 1800s, the Industrial Revolution brought great changes to the economies of many countries. Factories were invented, and soon manufacturing grew greatly. Manufacturers did not want governments to control trade anymore. They wanted to be left alone to run their companies. This idea became known as “laissez-faire,” which means “allow to do” in French.

Reactions to Capitalism

During the 1800s and early 1900s companies produced more and more goods, and many capitalists became rich. However, ordinary workers earned low wages while working long hours, sometimes in dangerous conditions. These problems led to the growth of labor movements. Many workers banded together to demand better treatment from companies.

The ideas of socialism also became popular. Under socialism, a government controls the economy by owning companies and property. It then tries to spread its country’s wealth fairly among its citizens. Many countries followed some socialist ideas in the 1900s. Some

countries, including the Soviet Union, adopted an extreme form of socialism called Communism.

Capitalism Today

Laissez-faire capitalism mostly ended during the 1930s. People throughout the world suffered economic problems during a period called the Great Depression. Many people—not just socialists—came to believe that governments had to help control the economy. Most governments now pass laws to make companies treat customers and workers fairly.

Capitalism remains the world's most popular economic system. Many countries today even mix capitalism with socialism. In these countries, the government owns some companies and provides many services, but individuals may own companies, too.

Capital Punishment

Of all punishments for convicted criminals, capital punishment is the most severe. Because it means putting the criminal to death, it is often called the death penalty. In the 20th century many nations abolished capital punishment. However, some countries and most states of the United States continue to use it.

A group of people in California attend a protest against capital punishment.

Conflicting Views

People who support capital punishment say that justice is done when a person who has committed murder is executed. They also say that fear of death will make people less likely to commit murder.

People who oppose capital punishment say that it is not civilized. They doubt whether it prevents crime, and they point out that innocent people have been wrongly executed. They also argue that capital punishment is applied unevenly. Most people who are executed are poor or members of minority groups who do not have access to good lawyers.

History

Capital punishment goes back to ancient times. In ancient Greece and Rome people were put to death for many different crimes. It has been limited over time, though in some countries it is still used for a variety of offenses. In the United States in 2002

the U.S. Supreme Court ruled against executing anyone who is mentally impaired. Three years later the Court banned execution for people who were less than 18 years old when they committed their crimes.

Caracas

Population
(2001 estimate), city, 1,836,000; (2005 estimate), urban area, 2,913,000

Caracas is the capital of Venezuela, a country in northern South America. The city is in a valley surrounded by mountains. The port of Caracas lies on the Caribbean Sea, about 20 miles (32 kilometers) away from the city. Caracas is the largest city in Venezuela by far. It is the country's center of culture, education, business, and manufacturing.

Venezuela's largest companies all have offices in Caracas. Many people in the city work in banks, insurance companies, shopping centers, and government offices. Important products made in Caracas include chemicals, clothing,

Mountains provide a beautiful background for the city of Caracas, Venezuela.

processed foods, paper, and medicines. Tourism also brings money to Caracas.

The Spanish founded the city in the 1560s. In 1577 Caracas became the capital of a Spanish province. English pirates attacked the city in 1595. Earthquakes almost destroyed Caracas in 1755 and 1812.

Caracas was the birthplace of Simón Bolívar, who led several revolutions against Spanish rule. Under his leadership Venezuela became the first colony to rebel against Spain. Venezuela became an independent country in 1830 with Caracas as its capital.

Many people moved to Caracas during the 20th century. The city grew quickly. In 1999 a rainstorm caused floods and mudslides throughout northern Venezuela. Many thousands of people in Caracas were killed.

Cardiff

Population
(2006 estimate)
317,500

Cardiff is the capital of Wales, one of the four main parts of the country called the United Kingdom. It is the largest city in Wales. The city lies where the Taff River flows into a part of the Atlantic Ocean.

The economy of Cardiff depends heavily on government activity and service industries such as health care, education, and tourism. The city is Wales's center of trade, shopping, banking, and insurance.

The Romans built a fort in the Cardiff area in ancient times. In the 1090s a landowner from England built another fortification on the same site. This became Cardiff Castle. A town grew around the castle.

Cardiff was a small town for hundreds of years. Coal mines were developed in the area in the late 1700s. After that Cardiff grew into a major port for shipping out coal. The city's coal trade ended in the 1960s. But Cardiff remained the most important city in Wales.

Cardinal

Cardinals are American songbirds known for the male's bright red feathers. Both the male and the female sing a loud, clear whistling song year-round. The northern cardinal is one of the most common birds of North America. It is related to finches, grosbeaks, and many types of sparrows. Other species, or types, of cardinal live in South America.

Northern cardinals are found mainly in the United States east of the Rocky Mountains, in southeastern Canada, and in Mexico. These birds do not fly south for the winter. Instead they spend the entire year in the same area. They live in bushes, in gardens, and at the edges of woodlands.

Cardiff Castle is located in the middle of the city. The stone structure called the keep of the castle was built in the 1100s.

The male northern cardinal is a colorful visitor to birdfeeders in many parts of North America.

The northern cardinal is about 8 inches (20 centimeters) long. It has a pointed tuft of feathers, called a crest, on top of its head. The males are red with black face markings and red crests. The females and young cardinals have gray-brown backs. Their wings, tails, and crests are a dull red.

All cardinals have strong, cone-shaped bills. This helps them crush the seeds they eat. Cardinals also eat many kinds of insects and fruits.

Cardiovascular System

Humans and many other animals depend on blood flowing through their bodies to keep them alive. The blood travels through a system that includes the heart and a network of blood vessels. This is called a cardiovascular system.

Heart

The human heart is a pear-shaped organ about the size of a fist. It is made up of a special type of muscle called cardiac muscle, which is not found anywhere else in the body. The heart acts as a pump to push the blood throughout the body.

The heart is separated into four chambers, or parts. The upper chambers are called atria, and the lower chambers are called ventricles. A valve, or a flap that can open and shut, connects each atrium to the ventricle below it. The valves control the movement of blood through the heart.

Blood Vessels

The blood vessels are a system of tubes that carry the blood throughout the body. The main vessels are arteries, veins, and capillaries. Arteries carry blood out from the heart. Veins return blood to the heart. Arteries are the thickest of all blood vessels. They

Blood flows from the heart through arteries and into capillaries. It then returns to the heart through veins.

expand and contract to keep blood moving away from the heart. Veins contain valves that prevent blood from flowing backward. Capillaries are tiny passages that connect the arteries and the veins to the body's tissues.

Blood flows through the vessels in two very specific paths. In the first path, called pulmonary circulation, blood travels from the heart to the lungs. In the lungs carbon dioxide and other waste gases leave the blood. The blood takes in oxygen and then returns to the heart.

In the second path, called systemic circulation, the blood travels away from the heart throughout the body. The arteries carrying the blood branch out into smaller vessels called arterioles and finally into capillaries. In the capillaries the blood transfers oxygen and nutrients to cells in the body's tissues. The blood in the capillaries also collects waste products from the cells. From the capillaries the blood flows into small vessels called venules. These unite to form veins. The blood flows through the veins back to the heart.

Other Organs

In addition to the lungs, many other organs in the body interact with the cardiovascular system. Blood carries away nutrients from the intestines, which are part of the digestive system. The spleen and the liver filter, or clean, the blood by removing old blood cells and bacteria. The kidneys take water, minerals, and other waste products from the blood.

Blood continuously flows from the heart, throughout the human body, and back to the heart.

As blood travels through capillaries, it delivers oxygen and nutrients to the body's cells. It also picks up carbon dioxide and other wastes.

Diseases of the Cardiovascular System

When the force of the blood against the walls of the blood vessels is too high, a person has hypertension, or high blood pressure. Hypertension can weaken the heart and damage other organs.

Sometimes fatty deposits thicken and harden the walls of the arteries. When this happens a person has arteriosclerosis. Arteriosclerosis slows the flow of blood, which can lead to a heart attack.

Carib

The Carib were American Indians who lived in South America and on islands in the Caribbean Sea. The sea was named after the Carib.

The Carib first lived in small villages in northern South America. They built houses of pole frames covered with palm

leaves. They got their food by hunting and farming.

After AD 1000 many Carib moved to the Caribbean islands called the Lesser Antilles. The island Carib were more warlike than the South American Carib. They drove the Arawak people off the islands.

The island Carib were fierce fighters. After torturing and killing enemy men, they took the women into their tribe as wives or slaves. The Carib may have eaten the bodies of their enemies. This practice, called cannibalism, may have been part of the tribe's religion.

Spanish explorers began arriving in Carib lands in the late 1400s. The South American Carib were wiped out by fighting and by diseases brought by the Spanish. But the Spanish avoided the islands where the Carib lived. There was no gold on them, and the island Carib were too hard to defeat in battle. Other

A Carib man weaves baskets on the island of Dominica.

Europeans conquered the islands in the 1600s. Only a few Carib survived. Today their descendants live on the islands of Saint Vincent and Dominica.

The Garifuna are another group of people with Carib roots. The Garifuna originated when slaves brought from Africa mixed with island Carib. Garifuna today live in the Central American countries of Belize, Honduras, and Nicaragua.

Caribbean Sea

The Caribbean Sea sits between the islands of the West Indies and the coasts of Central and South America. It is a section of the Atlantic Ocean. The sea was named after the Carib Indians. The Carib lived on islands in the sea hundreds of years ago.

The Caribbean Sea has a mainly tropical climate. Temperatures are warm year-round. Tropical storms are common in summer in the northern Caribbean.

Many visitors come to the Caribbean Sea to look at wonders beneath the surface of the water.

Hurricanes often strike Caribbean islands between June and November.

The Caribbean region has mostly tropical plants. Rain forests grow in the high parts of Cuba, Jamaica, Puerto Rico, and other islands. Coconut palms are typical on the sandy shores of the islands. Monkeys, cats, sloths, parrots, and toucans live in the forests. In the sea itself, many fishes and other sea animals live along coral reefs.

The Caribbean economy depends heavily on tourism. With its sunny climate, the Caribbean is one of the world's most popular vacation places. Fishing is also important to the economy. Tuna, sardines, and spiny lobsters are valuable catches. Caribbean countries ship coffee, sugar, and bananas to the United States and Canada.

Carnation

The carnation is a pretty flower with a pleasant smell.

The carnation is a flower that is often used in bouquets and corsages. People have grown carnations in gardens for more than 2,000 years. The scientific name of the carnation is *Dianthus caryophyllus*.

Carnations originally grew wild in the area around the Mediterranean Sea. Today most carnations are grown in gardens and greenhouses.

Carnation plants range from 1 to 3 feet (30 to 90 centimeters) in height. The stems are stiff. The flowers may be small or large. They have fringed petals. The first carnations had pink flowers. Growers developed white and deep red varieties in the early 1500s. The hundreds of kinds grown today include purple and yellow shades. Some carnations are striped.

Carnations often have a spicy smell. In the past people used carnations to spice wine. Carnations also were used to treat fevers. In 1907 the pink carnation was chosen as a symbol for Mother's Day.

Carp

Carp is the name of several fish in the carp family. One of the best-known carp is the common carp, a large freshwater fish. Goldfish and minnows also belong to the carp family.

Carp live in ponds, lakes, and rivers all over the world. Carp prefer warm, calm waters, but they can survive in nearly any type of fresh water.

Carp may be brownish yellow, greenish, or gray in color. Most types of carp have feelers, called barbels, at the corners of the mouth. The barbels help the carp find food in dark, muddy water. Different types of carp vary in size. The com-

Colorful carp swim in a pond in Japan. This type of carp, called koi, is popular in backyard and garden ponds.

mon carp may grow longer than 40 inches (100 centimeters). But it is usually only about 14 inches (35 centimeters) long.

Carp eat both plants and animals. When carp feed, they suck up everything from the bottom and spit out the dirt. This behavior muddies the water and can disturb other fish.

Carp live alone or in small groups. Female carp lay thousands of eggs each year. The eggs hatch within several days, and the baby carp grow quickly.

Carp is a popular food in Asia and Europe. People also eat carp in the United States and Australia. But many people in these countries consider carp to be pests.

Carroll, Lewis

The English author Lewis Carroll wrote the children's classics *Alice's Adventures in Wonderland* and *Through the Looking-Glass*. These books are beloved for their unusual settings, lively characters, and clever wordplay.

Carroll was born in Daresbury, England, on January 27, 1832. His real name was Charles Lutwidge Dodgson. He studied mathematics at Oxford University in England. For most of his life he lived at Oxford while teaching mathematics. He wrote books on mathematics and logic.

An illustration by John Tenniel shows Lewis Carroll's most famous character, Alice, as she grows larger and larger.

One day in 1862 Dodgson told three young girls tales about a child named Alice. Later he used the tales to write *Alice's Adventures in Wonderland*. It was published as a book in 1865. In the story Alice crawls into a rabbit hole and meets all sorts of interesting creatures. Another book about Alice, *Through the Looking-Glass*, appeared in 1871. Dodgson wrote the books under the name Lewis Carroll.

Dodgson also used the name Lewis Carroll to write books of poetry for children. In 1876 he published a famous nonsense poem, *The Hunting of the Snark*. He died in Guildford, England, on January 14, 1898.

Literature for Children

Carrot

Carrots are roots that people eat. They are highly valued for their sweet flavor.

Carrots are a popular garden vegetable. The main part of the carrot that people eat is the root of the plant.

Many carrots are also a good source of vitamins.

There are several types of carrot. The most common are orange. There are also white, yellow, and purple carrots. Most carrots are long. They are usually wide at the top and smaller at the end. Carrots are firm and crisp. The skin is mostly smooth, but it may have wrinkles that go from side to side.

Carrots grow where the temperature is cool to warm. Sometimes carrots push up above the ground. When this happens, the sun can turn them green. They will also taste bitter. To prevent this, farmers make sure carrots are completely covered with soil.

Leaves on long stalks grow out of the top of the carrot. On the ends of the stalks are flowers. They form an umbrella of tiny white or pinkish blooms. Small fruits grow from the flowers. Each fruit holds two seeds.

Carrots are eaten both fresh and cooked. They are used in many dishes, including

salads, stews, soups, sauces, and cakes. The juice of the carrot can also be a sweet drink. Orange carrots are a good source of a substance called carotene. The human body converts carotene into vitamin A.

Carson, Kit

The U.S. frontiersman Kit Carson helped make history as a fur trapper, guide, Indian agent, and soldier in the Old West. Nevada's capital, Carson City, was named for him.

Christopher Carson, nicknamed Kit, was born in Kentucky on December 24, 1809. When he was 1 year old his family moved west to Missouri. As a boy Kit fished, hunted, and trapped animals. When he was 15 his mother sent him off to learn how to make saddles. He soon decided that indoor work was not for him.

Kit Carson

In 1826 Carson ran away to New Mexico. There, at age 19, he joined some hardy fur trappers—called mountain men—on a trip to California. He took part in several fights with Native Americans.

In 1842 the explorer John Charles Frémont hired Carson as a guide for his trip to map the Oregon Trail. In 1846, on a trip to California with Frémont, Carson helped U.S. forces capture Los Angeles in the Mexican War.

In 1854 Carson became a government agent who dealt with the Ute people. During the American Civil War (1861–65) he organized and led a Union Army unit that fought Confederates and Native Americans in the Southwest. In 1868 Carson was put in charge of Indian affairs for Colorado Territory. He died in Colorado on May 23, 1868.

Carson City is the capital of the U.S. state of Nevada. The city is important as

The state Capitol in Carson City, Nevada, is surrounded by gardens.

a center of government and tourism. It is also a trade center for the area's mines, ranches, and farms.

The site of Carson City was on a route for pioneers traveling west to California. A trading post was established in 1851. The city was founded in 1858. In 1859 a large deposit of silver, known as the Comstock Lode, was discovered nearby. Carson City soon became crowded with miners. In 1869 the U.S. government opened a mint, or coin factory, in the city. The Carson City mint closed in 1893. However, the mint building later became a museum.

Carson City became the capital of the Nevada Territory in 1861. Nevada became a U.S. state in 1864 with Carson City as its capital.

Nevada

Carter, Jimmy

Jimmy Carter became the 39th president of the United States in January 1977. Many people thought that he was an unsuccessful president. However, Carter later won the 2002 Nobel prize for peace.

Early Life

James Earl Carter, Jr., was born on October 1, 1924, in Plains, Georgia. His father, Earl, was a businessman. His mother, Lillian, was a nurse. Jimmy was the first member of his family to complete high school. He went on to attend Georgia Southwestern College and the Georgia Institute of Technology. In 1946 he graduated from the U.S. Naval Academy in Maryland. That year he married Rosalynn Smith. The couple had three sons and a daughter. After his father's death in 1953, Carter returned to Georgia to manage the family peanut farm.

Jimmy Carter was the 39th president of the United States.

Political Career

Carter soon became involved in local politics. He was elected as a Democrat to the Georgia Senate in 1962 and 1964. In 1966 Carter ran for governor of Georgia but lost. Feeling depressed, he turned to Baptist Christianity. Carter ran again for governor in 1970. This time he won. In his inaugural address he called for an end to racial discrimina-

1970

Carter helps the leaders of Egypt and Israel agree to peace.

1978

Carter loses the presidential election to Ronald Reagan.

1980

tion. He appointed African Americans and women to government offices.

Presidency

Carter next decided to run for president. He won the Democratic nomination in July 1976. He chose Senator Walter F. Mondale as his vice presidential running mate. During the campaign, Carter called for efficiency and honesty in government. In November 1976 he won a narrow victory against the Republican president, Gerald R. Ford.

Carter took office during a severe winter and a terrible shortage of oil. He proposed an energy program to help the crisis, but Congress rejected it. Carter also tried to cut back government spending and to encourage the nation's poor economy. Many citizens could not find jobs, however, and prices kept rising.

In 1978 Carter persuaded the leaders of Egypt and Israel to sign a historic peace agreement. On January 1, 1979, Carter opened full diplomatic relations between the United States and China. A serious crisis overshadowed those successes, however. On November 4, 1979, Iranian students invaded the U.S. Embassy in Iran and took more than 50 people hostage. Most of the hostages were not freed until January 1981.

The bad economy and the hostage crisis caused voters to question Carter's skills as president. Carter lost the 1980 election to the Republican candidate, Ronald Reagan.

Retirement

Carter's public image improved after he left the White House. He and his wife founded the Carter Center in Atlanta, Georgia, to promote peace and human rights. He traveled widely to help settle international conflicts. He helped build homes for the poor with the organization Habitat for Humanity. He also wrote several books on politics and religion.

Carthage

The ancient city of Carthage was founded by the Phoenicians on the north coast of Africa in about 800 BC. Until it was overthrown by Rome in 146 BC, Carthage was the trading center of the western Mediterranean Sea. Today Carthage is a suburb of Tunis, the capital of Tunisia.

A gold coin from Carthage dating from the 300s or 400s BC shows the goddess Persephone.

According to legend, Carthage was founded by Dido, daughter of the king of Tyre. Tyre was a Phoenician city in what is now Lebanon. Dido ran away to Africa after her husband was killed. She chose to settle on a peninsula covered with low hills, facing a bay called the Lake of Tunis.

The Carthaginians were seafarers and traders. They traded in foodstuffs, textiles, slaves, and metals such as tin, silver, gold, and iron. The city prospered from the late 500s BC on. It even established its own colonies in North Africa, southern Spain, and the Mediterranean.

Carthage fell to Rome after a series of wars. These were called the Punic Wars, after Poeni, the name by which the Romans called the Phoenicians. In the first Punic War, from 264 to 241 BC, Carthage lost the island of Sicily. In the second, from 218 to 201 BC, a Carthaginian army led by Hannibal crossed the Alps by elephant to defeat

the Romans. However, Hannibal was later defeated in North Africa. In the third, from 149 to 146 BC, Carthage was looted and burned.

In 122 BC the Romans founded their own colony on the site. In AD 533 the Byzantine Empire took control of the area. The Arabs captured the city in 705 and made the nearby town of Tunis their capital.

Cartier, Jacques

Like many other European explorers, Jacques Cartier went to North America looking for gold, spices, and perhaps a shortcut to Asia. Instead he found the Saint Lawrence River, which became France's main route into Canada.

Jacques Cartier was born in 1491 in Brittany, a province of France. In about

1534, the king of France asked him to lead an expedition to North America.

In the spring of 1534 Cartier sailed across the Atlantic Ocean to what is now Canada. There he and his crew explored the land around the Gulf of Saint Lawrence and encountered Native Americans. When he sailed back to France, he took with him two Native Americans.

A second voyage came in May 1535. This time, Cartier sailed deeper into the Gulf of Saint Lawrence and into the Saint Lawrence River. The two Native Americans he had taken before had learned French, and they served as guides. About 260 miles (420 kilometers) inland, Cartier reached the Native American village of Stadacona. Today, the city of Quebec stands near that place.

Cartier and his men were among the first Europeans to winter in what is now Canada. The bitter cold surprised them, and some of the men died. After returning to France he reported tales told by the native people of treasures farther inland.

Cartier once again crossed the Atlantic in 1541. He explored further and found what he thought were gold and diamonds. When he returned to France in 1542, he was told that they were just the common minerals pyrite (fool's gold) and quartz. After his third voyage Cartier never returned to North

America. He died near Saint-Malo, his birthplace, on September 1, 1557.

Cartoon

Cartoons are drawings that make a point, tell a joke, or tell a story. Cartoons can be about almost anything. Many cartoons are about the things that everyday people say and do. Others are about the news, government leaders, or historical events. Many cartoons try to make people laugh.

Types of Cartoons

Comic strips are a popular type of cartoon. A comic strip usually has four or more drawings in a row that tell a connected story. Comic strips feature a cast

Cartoonist Charles Schulz works on a "Peanuts" comic strip. He drew this popular cartoon for about 50 years.

of characters, such as the children in the comic strip “Peanuts.”

Other types of cartoons include political cartoons, gag panels, and animated cartoons. Political cartoons show what is wrong with the government or make fun of it. They are usually single drawings, but there are some political comic strips. Gag panels are single drawings that make fun of everyday life. Animated cartoons are cartoons filmed as movies or television shows.

Cartoons may be found in newspapers, magazines, and books. Comic books and graphic novels are books filled with many comic strips or cartoons.

History

People have been using pictures to tell stories since prehistoric times. Prehistoric artists drew pictures of animals on the walls of caves. In ancient Egypt, Greece, and Rome, artists painted pictures on vases and walls. These pictures recorded historical events, the lives of important people, and legends.

From the 1500s to the 1700s people got the news through short printed works that had many pictures. Many of these pictures were early forms of political cartoons. Political cartoons became common throughout Europe and the United States during the 1800s.

During the 1900s funny gag panels and comic strips became more popular than political cartoons. Popular cartoons of the late 20th and early 21st centuries

included “The Far Side,” “Calvin and Hobbes,” “Bloom County,” and “Get Fuzzy.”

Carver, George Washington

George Washington Carver

George Washington Carver was born in slavery but went on to win worldwide respect for his work as a scientist. By finding new ways to process peanuts, soybeans, and sweet potatoes, he helped to make them important crops in the southern United States.

Carver was born in about 1861 near Diamond Grove, Missouri. At about age 12 he left home. He eventually attended Iowa State Agricultural College in Ames, Iowa. He received a bachelor's degree in agriculture in 1894 and a master's degree in 1896. Carver then became

Did You Know?

Comic strips became a regular feature of U.S. newspapers in the early 1900s.

head of the agriculture department at the Tuskegee Institute in Alabama. There he stayed for the rest of his career.

Before Carver's time, Southern farmers grew very few crops other than cotton, a plant that wore out the soil. Carver tried to get them to switch to peanuts and soybeans. These plants were legumes. They added nitrogen, a fertilizer, to the soil and also could be made into nutritious foods.

With his laboratory work, Carver tried to make sure that farmers who grew these crops would be able to sell them. He developed 300 products from peanuts. He also took an interest in sweet potatoes and developed more than 100 products based on the plant.

Carver's efforts won him numerous honors and improved life throughout the South. Some scientists criticized his informal methods, however. In addition, some African Americans were disappointed because he did not take a strong public stand on racial issues.

Carver died in Tuskegee on January 5, 1943. He was buried on the Tuskegee campus.

Caspian Sea

The world's largest inland body of water is the Caspian Sea. Lying between Europe and Asia, it is bordered by Russia and Azerbaijan on the west, Kazakh-

stan and Turkmenistan on the north and east, and Iran on the south. The sea was named for the Kaspi, ancient peoples who once lived on its western shores.

The Caspian Sea is nearly the size of Japan, covering an area of about 143,000 square miles (370,000 square kilometers). The sea is shallowest in the north, where the depth averages just 13 to 20 feet (4 to 6 meters). The deepest parts are in the south. In one place the seafloor lies 3,360 feet (1,024 meters) below the water's surface. Three major rivers—the Volga, the Ural, and the Terek—empty into the Caspian from the north. The sea contains as many as 50 islands, most of them quite small.

The Caspian has long been famous for its sturgeon. These fish produce eggs that are made into the salty delicacy called caviar. The number of sturgeon greatly declined, however, as the water level of the Caspian dropped during the 1900s. Today the chief industry of the Caspian region is the production of oil and natural gas. Surrounding countries

collect these products from the seabed and sell them to other countries.

Caste

In some countries a person's place in society is decided by a caste system. The caste that they belong to is based on their wealth, occupation, and family background. Although the term is used to describe groups in other countries, the system is most well developed in India.

Did You Know?

In India there are thousands of different *jatis*. This is because each city or region may have its own set of castes.

In India, castes are called *jatis* and are grouped into four *varnas*, or categories. At the top are Hindu priests and scholars; next are the rulers and military leaders; then merchants, traders, and farmers; and, last, craftspeople, workers, and servants. A group of people who used to be called the untouchables ranks even below this last group. In the early 1900s the Indian leader Mahatma Gandhi renamed these people Harijans (children of God). Gandhi did not believe in the caste system and fought to end it.

In later years India's caste system became somewhat more flexible. Even though there was pressure to end it completely, the caste system continued into the 21st century.

Castle

For many centuries castles provided both protection and living quarters for

kings, nobility, and sometimes common people. The fortifications, or military defenses, built into a castle set it apart from a palace. A palace is usually a grand house for a king or noble. Most castles were built in Europe between the 800s and the 1400s, during the period known as the Middle Ages. But castles were built in North Africa, western Asia, India, and Japan as well.

Motte and Bailey Castles

One early type of castle was the motte and bailey castle. The motte was a high mound of earth. A fenced-in tower, usually made of wood, stood on the motte. Next to the motte was a lower, larger walled area called the bailey. The castle's other buildings, such as workshops and stables, stood within the bailey. A ditch called a moat protected the motte and sometimes the bailey, too.

Later Castles

Over time castles were made stronger. Beginning in the 1100s builders increasingly used stone instead of wood. A typical stone castle was surrounded by a moat. The main walls of most castles were very thick—sometimes more than 15 feet (4.6 meters). Special defenses blocked the entrance. A hinged drawbridge across the moat could be pulled up to cover the gateway. In front of the gateway hung the portcullis, a heavy grate that slid in stone grooves and could be dropped into place very quickly. Farther inside was a large gate.

Within the walls was a central structure called the keep, or donjon. This replaced the tower that stood on the motte of the

The three main types of castles are the motte and bailey castle, the stone castle and keep, and the concentric castle.

earlier castles. It was the strongest and most secure part of the castle. Some keeps consisted of one high building. Others took the form of a high wall that enclosed several buildings. In early stone castles the keep had everything needed to withstand a long siege. During a siege, enemies camped outside and prevented anyone from entering or leaving.

In castles built later, however, the keep became a place to go for safety after all other defenses had failed.

Beginning in the late 1200s a new design began to appear. These had walls in the shape of a square. Round towers were spaced along the walls. Inside was another, larger wall with large towers

and a gatehouse. These were called concentric castles. The living quarters and other buildings were within the inner walls. There was no need for a keep because the towers were used for defense.

Decline of the Castle

Castles lost their usefulness in the late Middle Ages. Large firearms developed at that time could hurl cannonballs over or through a castle's walls. Beginning in about 1500 forts replaced castles as military defenses, and rulers lived in palaces or mansions. Some castles still stand today and are popular tourist attractions.

Castries

Population
(2001 census),
city, 10,634

Castries is the capital of Saint Lucia, an island country in the Caribbean Sea. Mount Fortune rises high above the town and its pretty beaches. Castries is the country's largest town and chief port. Tourism and banking are also important to the town's economy.

Hundreds of years ago the Carib Indians lived on the island. French people settled there in the mid-1600s. For many years the French and British

Locally grown produce is sold at a market in Castries, Saint Lucia.

battled for control of the harbor at Castries. The island changed hands several times. It became a British colony in the early 1800s. In 1979 Saint Lucia became an independent country with Castries as its capital.

Castro, Fidel

Fidel Castro ruled the country of Cuba for many years. He established a form of government called Communism. This meant that he had a great deal of control over the country and its people.

Early Life

Fidel Castro was born on August 13, 1926, in eastern Cuba. His father was a farmer who grew sugarcane. As a boy

Fidel Castro

Fidel worked in the fields. Later he went to law school. There he became involved in politics. He graduated in 1950. As a lawyer Castro defended the poor.

Revolutionary

The leader of Cuba at the time was a man named Fulgencio Batista. Many people opposed Batista. He treated his enemies harshly. He also stole money from the country.

Castro and his brother Raúl formed a group to oppose Batista. On July 26, 1953, the group attacked a military post. Most of the attackers died, and the Castros were imprisoned. After they were released from prison they continued to attack the government. On January 1, 1959, Batista left Cuba. Castro soon took control of the country.

Dictator

As leader of the country, Castro brought changes to Cuba. He took control of factories and farms. He permitted no

political opposition. However, he did make some changes to help the common people. Many Cubans left the country when Castro took over. Some of them later returned to try to overthrow Castro, but they were not successful.

For many years the Soviet Union supported Cuba's economy. After the Soviet Union broke up in 1991, Cuba's economy struggled. Castro then allowed some economic reforms. In the early 2000s he began to suffer health problems. When he had surgery in 2006 he gave his brother Raúl power to rule until he recovered. In 2008 Fidel Castro officially stepped down as president of Cuba.

Cat

The domestic cat, or house cat, is a small mammal that has lived among people for thousands of years. People have kept cats as pets, used them as hunters, and even worshipped them as gods. Domestic cats belong to the same animal family as the lion, tiger, jaguar,

A domestic cat sits atop a fence.

Some Longhair Breeds of Cat			
	Name	Origin	Features
	Himalayan	United States, Europe	sapphire-blue eyes; thick body; short, full tail
	Maine Coon	United States	large, muscular body; shaggy coat of fur
	Persian	possibly Iran	thick body; large head
	Ragdoll	United States	blue eyes; heavy and powerful build
	Turkish Angora	Turkey	long, full tail; large, pointed ears

leopard, puma, and cheetah. The scientific name of the domestic cat is *Felis catus*.

Where Cats Live

Domestic cats live with people in nearly every part of the world. Some domestic cats have no home. These cats, called feral cats, wander freely in many cities.

Physical Features and Breeds

The domestic cat has a long and powerfully built body. Males are about 28 inches (71 centimeters) long. Females are about 20 inches (51 centimeters) long. Large, forward-facing eyes help the cat to see well, even at night. Its triangular ears can turn quickly toward the source of a sound. Four rows of stiff whiskers grow on each side of the nose.

Small groups of whiskers also grow on other parts of the body. These give the cat a delicate sense of touch.

A cat’s fur may be black, white, brown, gray, yellow, red, or orange. It may also be striped (tabby); a mixture of white, black, and yellow (tortoiseshell); or marked with patches of color (calico). Cats use their rough tongues to comb and to clean their fur.

There are many breeds of domestic cat. Cats of the same breed have a similar length of hair and other similar features. Most breeds—for example, the Abyssinian, the American Shorthair, and the Siamese—have short hair. Other breeds, including the Persian, have long, thick coats.

Some Shorthair Breeds of Cat			
	Name	Origin	Features
	Abyssinian	probably Egypt	slim body with long legs
	American Shorthair	United States	broad, muscular body; thick fur
	Bengal	United States	spotted coat; hind legs shorter than forelegs
	Cornish Rex	England	curly, short coat; large ears
	Japanese Bobtail	Japan	triangular head with large ears; rabbitlike tail
	Manx	Isle of Man	tailless or with stump; double coat of fur
	Russian Blue	Russia	blue coat with silver tips; muscular
	Scottish Fold	Scotland	folded ears; short, rounded body
	Siamese	Asia	sapphire-blue eyes; long, lean body
	Sphynx	Canada	hairless; large ears

Behavior

Domestic cats are carnivores, or meat-eaters. Many hunt and eat small ani-

mals, including birds, mice, and rabbits. They use their claws, which they can draw back or in, and their strong, sharp

Did You Know?

The Egyptian goddess Bast, or Bastet, was represented in pictures and statues as a lioness or as a woman with a cat's head.

teeth to catch prey. House cats eat mainly canned or dry food made especially for cats.

The cat is the only animal that makes a sound called a purr. Cats produce purring in their throat. No one knows exactly why cats purr, but it may be a sign of comfort. Cats also make other sounds, including meowing, hissing, yowling, and growling.

Life Cycle

A female cat gives birth to a litter of kittens about two months after mating. A female may have two to three litters a year. The average litter is four kittens, but there may be only one kitten or as many as seven. A newborn kitten is about 3 inches (8 centimeters) long. It has no teeth, the ears lie flat, and the eyes are closed. A kitten's full development takes about one year. Cats may live to be about 15 years old.

Cats and Humans

About 4,500 years ago the ancient Egyptians worshipped cats. The Egyptians probably domesticated, or tamed, wild cats about 3,500 years ago. They used these cats to kill the rats and mice that ate their stored grain. Cats were also present in Greece, China, and India in ancient times.

During the Middle Ages (about AD 500–1500), many Europeans feared cats because cats were linked with witches. Some people still think that black cats are unlucky.

Today millions of people around the world keep cats as pets. In the United States there are more pet cats than pet dogs.

Catacomb

In ancient times people in the region surrounding the Mediterranean Sea buried their dead in underground tunnels and rooms. They cut these tunnels and rooms, called catacombs, out of a layer of soft stone below the ground.

The most famous catacombs were created around Rome, Italy, by early Christians. About 40 Christian catacombs have been found in the area. Most were built between about AD 200 and 400. The Jews and many other peoples also built catacombs in ancient times.

People were buried in stone graves on the floor and in the walls of a catacomb in Italy.

Stairways led from ground level to the catacombs below. The catacombs were long, narrow passageways with rows of rectangular graves carved out of the rock along the sides. Several rows of graves were stacked from floor to ceiling. In Christian catacombs rooms along the passageways were used for burying martyrs (people who were killed because of their religion) or several members of a family. On the walls of some of the rooms are prayers and paintings of religious symbols or figures.

In the centuries after the fall of the Roman Empire in 476, invading armies destroyed many of the Roman catacombs. By about the 800s the catacombs were no longer used, and over the years people forgot about them. They were rediscovered by accident in 1578. Since then people have studied the catacombs for the clues they offer about ancient peoples.

Catapult

Catapults were important weapons of war before guns and cannons were invented. A catapult was a simple machine. It was used to throw heavy objects at the enemy with great force.

There were several different forms of catapult. The most basic type was made up of a long wooden arm with a large cup on the end. Attached to the arm was a rotating tube, called a winch. A rope was fastened to the arm and wound around the winch. At the base of the arm was a set of cords.

A small catapult with wheels would have been used in battle.

To set the catapult, soldiers tightened the rope by winding the winch. This caused the cords at the base of the arm to twist and get tighter and tighter. The soldiers loaded the cup with a large rock or other objects. Then they released the rope. The cords around the base untwisted all at once. The arm then swung forward, flinging the load. A large catapult could hurl a stone as far as 1,500 feet (460 meters).

Soldiers often used catapults to destroy castle walls. They usually needed more than one catapult for a successful attack on a castle. Soldiers also used catapults to fling spears at an advancing army.

Armies used large and small catapults. They wheeled small catapults with them to battles. Carpenters traveling with armies often built catapults on the way to a battle. Larger catapults usually stayed in one place. People living in cities and castles used such large catapults to defend themselves.

The earliest catapults appeared during the 1200s BC. The ancient Romans improved the catapult and made catapults on wheels. Today's armies use

devices based on the catapult to launch missiles and airplanes.

Catfish

A catfish is a fish that has one or more pairs of whiskerlike feelers by its mouth. These feelers, known as barbels, help the fish to taste and to feel. There are about 2,500 species, or kinds, of catfish. They are related to the carp, characins, and minnows.

Catfishes live in freshwater on all the major continents. A few types live in oceans.

Catfishes range greatly in size. One of the largest types is the wels. This catfish may be more than 15 feet (4.5 meters) long. Some of the smallest catfish species are barely 2 inches (5 centimeters) long.

A catfish's "whiskers" are called barbels.

Catfishes do not have scales. Some types have an armor of bony plates. Many types have stiff, poisonous points on their back and sides.

Catfishes generally live near the water's bottom. They tend to be active at night. They feed on almost any kind of animal or plant material. Some kinds of catfish build a nest for their many eggs. Other kinds carry their eggs in their mouth.

Many people like to catch and to eat catfishes. People often keep small catfishes in aquariums.

Cathedral

A Christian church that is the home church of a bishop is known as a cathedral. Bishops oversee many churches in a particular region, so the cathedral is often larger and more decorative than the others. However, cathedrals may be of any size and style. Especially huge and magnificent were the cathedrals built in the Gothic style between about the 1100s and 1400s in Western Europe. Gothic cathedrals are usually made of gray stone, feature a round window above the altar, and have tall, arched windows along the sides. The windows are often made of stained, or colored, glass. Artists and craftsmen were eager to decorate these cathedrals, which were the center of a town's religious life.

Among Europe's famous cathedrals are Notre Dame in Paris, France; Saint

Saint Colman's Cathedral in Cobh, Ireland, towers above the surrounding buildings.

Mark's in Venice, Italy; Canterbury in England; and Cologne in Germany. North America is also home to a number of notable cathedrals. They include Saint Patrick's in New York City; Notre Dame in Montreal, Quebec; and the national cathedral in Mexico City, Mexico.

Cattle

Cattle are large, hoofed mammals that people raise for their meat, milk, or hides. In some places cattle also pull carts or farm equipment. Cattle belong to the scientific family Bovidae. This family also includes buffalo, bison, and yaks.

Cattle have many different names. Young cattle are called calves. A grown female that has not had a calf is a heifer. A female that has been a mother is a cow. A male adult is called a bull, a steer, or an ox.

Where Cattle Live

Cattle live almost everywhere in the world. Domestic, or tame, cattle often live on farms or ranches. In Asia and Africa there are both wild and domestic cattle. In India people let cattle roam freely throughout the cities and the countryside. This is because followers of Hinduism consider cattle to be holy.

Physical Features and Breeds

There are many different breeds of cattle. Cattle of the same breed have a similar color and size. Their coat of hair may be black, white, gray, yellow, brown, or red. Cattle may also have spots or areas of different colors. Depending on the breed, bulls weigh from 1,000 to 4,000 pounds (450 to 1,800 kilograms). Cows weigh from 800 to 2,400 pounds (360 to 1,000 kilo-

Gauchos, or cowboys, herd cattle in the Patagonia region of Argentina.

grams). Many breeds have horns, but some do not.

People raise some breeds mostly for their milk and others mostly for their meat. Cattle raised for milk are called dairy cattle. The most popular dairy cattle in the United States include the Holstein-Friesian, Brown Swiss, Jersey, and Guernsey breeds. Cattle raised for beef include the Angus, Shorthorn (or Durham), Hereford, and Brahman breeds.

Many domestic breeds originally came from Europe. Some originally came from Asia. For example, Brahmans originally came from India. Brahmans look different from other domestic cattle. They have a hump over their shoulders and neck, curving horns, and drooping ears.

Did You Know?

Cattle tear grass out of the ground with a sideways movement because they have no upper front teeth.

Behavior

Wild and domestic cattle eat grasses and other plants. After they swallow their food, they bring it up from the stomach to chew and swallow it again. This process is called chewing the cud. It helps cattle to digest tough plants. Farmers may also give special feed to domestic cattle to make them fatter.

Cattle and Humans

Cattle are very important to the economies of many countries as well as to small farmers. Cattle provide people throughout the world with meat, milk, cheese, and butter. People also make cattle hides into leather goods. In addi-

tion, cattle help to plow farmers' fields and haul heavy loads.

Cave

Huge stalagmites are a highlight of Carlsbad Caverns in New Mexico.

A cave is a natural hollow space under the ground that has an opening large enough for a person to enter. Caves range in size from tiny passages to huge systems of connected “rooms” and tunnels. The world’s longest cave system is Mammoth Cave, in the U.S. state of Kentucky. It is more than 350 miles (560 kilometers) long. Large caves are often called caverns.

Types of Caves

Most caves are called solution caves. Solution caves most often form in places where there is a type of rock called limestone. Limestone is a soft rock that dissolves, or breaks down, easily in water.

As water flows through small cracks in the limestone, the limestone dissolves and the cracks get bigger. Over a long time these cracks become large enough for people to enter.

Not all caves form in limestone. They can form in such rock as gypsum, marble, and dolomite. Caves may also form when melted rock, called lava, flows from volcanoes. The lava on the surface may cool while the lava beneath flows away. When this happens a cave is sometimes created. Caves may also form when earthquakes cause large cracks in solid rock. Ocean waves sometimes form sea caves along the coast. The action of the waves removes soft rock and forms hollow spaces.

Some caves do not form in rock. Glaciers, or huge areas of ice that move over land, can form ice caves. As water melts on the glacier's surface, it flows into

cracks in the ice. The water then carves out caves beneath the surface of the ice.

Cave Features

After a solution cave is formed, water continues to drip into it. Minerals in the water are slowly deposited on the ceiling and floor of the cave. Over time those mineral deposits, or crystals, build up into large formations. Those that hang down from the ceiling are called stalactites. They look like icicles. Stalagmites point up from the floor. They usually grow under dripping stalactites. Sometimes stalactites and stalagmites join together to form columns.

Cave Exploration

Cave explorers are people who like to find and explore caves. They are also called cavers or spelunkers. Sometimes they wiggle through tiny passages just big enough to get through. Other times they walk through passages that are tall

Water dripping into a cave contains minerals that build up on the ceiling and the floor. Over time the minerals may form stalactites, stalagmites, and columns.

Did You Know?

The Big Room in Carlsbad Cavern in the U.S. state of New Mexico is about 2,000 feet (610 meters) long and 255 feet (78 meters) high.

and wide. Sometimes they need ropes and special gear to cross or go down deep holes.

Cave exploration can be dangerous. Cavers are well trained to know how to explore safely. A person should never enter a cave without experienced cavers.

Cave-dwelling Animals

Caves are the home of many different animals. Some, such as bats, live in caves but come out at night to feed. Other cave-dwelling animals live their entire lives underground. Without light, they are usually white or transparent (clear) and do not have eyes. Blind animals found in caves include many different insects and spiders, types of shrimp, and some salamanders.

Animals that live in caves have special characteristics to help them survive. Those characteristics are called adaptations. Cave animals may not have sight, but their other senses are highly developed. For example, insects that live in caves usually have very long antennae to feel their way around. Other animals can feel vibrations, which tell them that something to eat is nearby.

Uses of Caves

People have been using caves for a long time. Early humans often camped in the entrances of caves. All over the world there are caves that people used as a place to live. In Europe there are caves with drawing of animals that are more than 15,000 years old. Scientists study these caves and drawings to learn more about how the people lived.

Caves are also used for recreation. There are many caves that people can visit without special equipment. Visitors to other caves need special equipment and lights. These caves require training to explore.

Cayuga

The Cayuga were one of the five original Native American tribes of the Iroquois Confederacy. The confederacy was an alliance of tribes that lived in upper New York State and spoke similar languages. The Cayuga originally lived around Cayuga Lake.

Like the other Iroquois, the Cayuga lived in longhouses. They made longhouses by covering a wooden frame with wood and bark. Longhouses were large

Red Cloud was a chief of the Cayuga tribe.

enough to house several families. Cayuga men hunted animals and birds and also fished. Women grew corn, squash, and beans.

Throughout the late 1600s the Iroquois fought and won many wars with other Indian tribes. The Cayuga took into their tribe many people from the tribes they defeated, including the Erie and the Huron. Like most of the other Iroquois, the Cayuga sided with the British in the American Revolution (1775–83). After the Americans won, settlers gradually took over the Cayuga homeland. Many Cayuga moved to Canada, Oklahoma, or western New York. At the end of the 20th century there were about 2,000 Cayuga. Half of them lived in the United States, and half lived in Canada.

Cedar

Cedars are evergreen trees that belong to the pine family. Their wood is highly valued because it does not rot easily. It also has a beautiful reddish color and a pleasant smell.

There are four species, or types, of cedar. Three of them originally grew only in the mountains around the Mediterranean Sea. They later spread to other areas. The other species grows in the Himalaya Mountains of southern Asia.

Cedars are tall trees with spreading branches. They can grow to a height of more than 100 feet (30 meters). Cedars

A group of cedars grows tall in Lebanon.

have leaves that are like needles. They grow in clusters along the branches. Cedars also produce large cones that hold their seeds.

Many other trees that have fragrant, reddish wood are called cedars. But most of them are actually cypress or juniper trees. Their wood is used to make clothing chests, closets, and pencils. Oil taken from the eastern red cedar, a juniper, is used in perfumes.

Cell

Every organism, or living thing, is made up of structures called cells. The cell is the smallest unit with the basic properties of life. Some tiny organisms, such as bacteria and yeast, consist of only one cell. Large plants and animals have many billions of cells. Human beings are made up of more than 75 trillion cells. The study of cells is a branch of biology.

Animal cells do not have cell walls. They can change size and shape more easily than plant cells.

General Features

Cells exist in a variety of shapes and sizes. For example, they may be cube-shaped or flat. They vary in size, too, but they are all very small. About 10,000 human cells could fit on the head of a pin. Bacteria cells can be much smaller.

Regardless of its shape and size, every cell can perform certain functions on its own. A cell can digest nutrients to provide its own energy. It can also produce new cells by making copies of itself. Most cells do this by dividing. In organisms with many cells, each cell must also cooperate with other cells.

Most many-celled organisms have cells of various kinds. The cells form different structures and perform different functions. Different types of animal cells, for example, form muscles, eyes, or teeth.

Different plant cells form flowers, fruits, or seeds.

Parts of a Cell

Most cells have three main parts—the cell membrane, the cytoplasm, and the nucleus. The cell membrane is like the skin of the cell. The cytoplasm performs many functions to keep the cell alive. The nucleus can be thought of as the cell's brain.

Cell Membrane

The cell membrane is a thin but tough wall surrounding the cell. It allows useful substances to enter the cell. But it blocks the entry of harmful substances. The membrane also forces out waste products.

Cytoplasm

The cytoplasm is composed mainly of water, with some solids. Most of the cell's constant work of keeping alive is performed in the cytoplasm. Special organs, called organelles, within the cytoplasm make important substances called proteins. Cells use proteins in most of their chemical processes. Other organelles change food molecules into material needed for energy and growth. A network of tubes transports material within the cell.

Nucleus

The nucleus is located near the center of the cell. It is surrounded by its own membrane. The nucleus acts as the control center of the cell. It regulates the cell's growth and reproduction.

The nucleus contains structures called chromosomes. Chromosomes contain the cell's genes, which determine the characteristics of the cell. When the cell makes copies of itself, the genes pass on the cell's traits to the new cells.

Types of Cells

Although they have many things in common, cells are different in different types of living things. The main types are plant cells and animal cells. Simpler organisms, including bacteria, have simpler cells. They have a membrane and cytoplasm but no nucleus.

In plant cells, a rigid wall surrounds and protects the cell membrane. The wall is made of a woody substance called cellulose. A plant's cell walls make the plant stiff enough to grow tall.

Plant Cell

Plant cells have stiff cell walls to help plants grow tall. They also have chloroplasts, which contain chlorophyll. Chlorophyll helps plants make food.

Animal cells do not have cell walls. This allows animal cells to change more in size and shape than plant cells can. However, most many-celled animals need structures such as bones to support their bodies. They also need shells or tough skins to protect them. Special cells form these structures.

In addition, most plants have a chemical called chlorophyll in their cells. This makes the plants green. Chlorophyll helps plants make food from the energy in sunlight. This process is called photosynthesis. Animal cells do not contain chlorophyll.

Celt

The Celts were a group of people who spread throughout Europe in ancient times. They ranged from what is now Turkey in the east to the British Isles and northern Spain in the west.

Historians have learned about the Celts by studying objects that they left behind. The oldest information about the Celts comes from graves of Celtic chiefs, or leaders, found in Austria. The graves date from about 700 BC.

The Celts lived in tribes. Each tribe had a chief, warriors, free farmers, and slaves. Most tribes lived in protected villages, often on a hilltop. There were fields and pastures nearby for farming and raising cattle.

Did You Know?

A scientist named Robert Hooke was the first to describe cells. In 1655 he saw through a microscope the boxlike units that made up a piece of cork.

A beautiful gold bowl displays the skill of Celtic artists.

The Celts were one of the first peoples in Europe to work with iron. They made swords, shields, helmets, and gold and silver jewelry.

The Celts practiced a religion called Druidism. Their priests were called Druids. The Druids taught that souls lived forever by passing from one person to another at the time of death.

Celtic power in western Europe lasted for only a few hundred years. Then Romans, Carthaginians (a people from North Africa), and German tribes took over. The Celts kept their unique culture only in parts of the British Isles and in the Brittany region of northwestern France. Some people in Ireland, the highlands of Scotland, the Isle of Man, Wales, and Brittany still speak Celtic languages.

Cement

The fine powder called cement is one of the main ingredients of concrete. When cement combines with water it becomes a paste. This paste is used to hold together all of the other materials that make up concrete.

In ancient times people used clay or a paste made of ground-up stone and other ingredients to hold their buildings together. Over the years people tried other combinations of materials. In the 1800s they came up with the combination that is still used today.

To make cement, large blocks of a type of stone called limestone are crushed or ground into small stones. The stones are then mixed with other minerals and ground some more. The result is then sent to an oven that is shaped like a giant tube. The materials are heated to a very high temperature as they flow down the tube. Some of the materials

A construction worker pours concrete. Cement is one of the main ingredients of concrete.

melt. This liquid mixes with the solid materials to form cement chunks about the size of marbles. The chunks are called clinker.

After the clinker leaves the oven it is allowed to cool. It is then mixed with another mineral called gypsum and ground to a fine powder. That powder is the finished cement.

Concrete

Censorship

A poster in New York City calls for an end to censorship in the arts.

Sometimes governments or other powerful groups set limits on people's freedom to speak or publish. This is called censorship. People who practice censorship are called censors.

Censors may examine books, newspapers, magazines, and speeches. They

may also review paintings, photographs, films, television shows, songs, e-mails, or other materials. If censors find information they do not want people to see or hear, they may ban the material, or keep it from being passed around. They may cut the information out of the material. Sometimes they may even punish the person who created the material.

Types of Censorship

Many types of censorship exist. People fight to ban books they do not like from school libraries. School boards try to get teachers not to teach certain subjects in the classroom. Sometimes advertisers do not like the television shows on the channels where their advertisements appear. They may refuse to advertise on those channels if the shows are not changed. Filmmakers sometimes change the language or the action in a movie to make it suitable for a wider audience.

People agree that some forms of censorship are necessary. A person is not free to shout "Fire!" in a crowded theater when there is no fire. Such an action would cause a panic and endanger lives. Also, governments can refuse to tell the public certain information if the safety of the nation is at stake. For this reason, many countries accept a greater level of censorship during wartime.

History

Governments and religious leaders have practiced censorship since ancient times. In ancient Rome, someone who criticized the government might be fined, removed from society, or put to death.

Did You Know?

Until 1966 the Roman Catholic church kept a list of books that Roman Catholics were not supposed to read.

During World War II (1939–45) the U.S. government asked citizens to censor their own letters and conversations. The government did not want people to discuss war plans that enemies might read or overhear.

The early Roman Catholic church censored anything that went against the church's teachings. The Inquisition, a court of the church, could punish people who spoke against the church.

Until modern times, printers in many countries had to let government censors read any work before it was published. If the censor disapproved, the work was not printed.

During the 1700s, people began to protest more strongly against censorship. In 1791 the U.S. Bill of Rights limited government censorship by guaranteeing the freedom of speech. Since then, many democratic nations have adopted similar laws. However, in countries with Communist governments or dictatorships, censorship is still strong. The people in

these countries may do and say only what the government approves.

Census

A census is a count of the people who live in a country. It also tells things about those people—their backgrounds, what they own, and how they live. Governments and businesses use censuses to guide important decisions. There are also censuses that focus on topics other than population, such as housing, farming, or industry.

Taking a Population Census

Censuses are expensive and take a long time. Governments in many countries, including the United States, take a census only once every 10 years. Other countries take a census every five years.

Census workers use a combination of methods to try to reach every person.

Census workers sometimes go to people's homes to interview them.

They mail question forms to homes. They also interview people face-to-face or over the phone. Most people have to answer only a few basic questions. But some people are asked for more information. The questions cover such topics as where the person lives, how old they are, whether or not they are married, and how many children they have. The questions also ask about a person's job, religion, ethnic background, language, and education.

After the information has been collected, census workers sort and study it. They put the information into reports that show different characteristics of the population. For example, census workers can report how many people live in rural areas compared to how many live in cities. Or they might report the size of the average family in a particular state.

Using the Information

Many governments use census results to make sure that different parts of the country are represented fairly in government. States with more people get to send more representatives to the national legislature (lawmaking body). Governments also use census information as a guide for providing money and services. For example, a government might send more money for schools to areas that have a lot of children.

History

The rulers of ancient Babylonia, China, Egypt, and Rome all took censuses. These rulers used censuses to find out how people could serve the government. For example, they wanted

to know how many men they could force to serve as soldiers. They also wanted to know who the wealthy people were so they could tax them. The people often gave incorrect information in these censuses. They were not honest because they did not want to fight in wars or to be taxed.

Censuses as they are known today did not begin until the 1600s. Leaders stopped using censuses only as a way to identify people for their own purposes. Countries started thinking of censuses as a way to understand the people and society. Then people were more willing to give correct information. Censuses became more accurate.

In 1790 the United States made history with its first census. This census was the first taken to decide how many representatives each state would have in Congress. It became a model for other countries to follow. England took its first census in 1801. France took its first reliable census in 1836. Canada's first census was in 1871, and India's was in 1872. China did not take its first accurate census until 1953.

The amount of information collected by censuses has grown over the years. And the technology used to process and publish the information has advanced. Census takers in the United States first used mechanical adding machines in 1870. They started using electric machines in 1890. A giant computer called UNIVAC processed the 1950 census.

Did You Know?

In ancient times the Inca of South America took censuses. They recorded their findings by tying knots in cords called quipus.

Now census results are published on the Internet.

Centipede and Millipede

The crawling creatures called centipedes and millipedes belong to the same animal group—the arthropods—as insects and spiders. But centipedes and millipedes have many more legs than other arthropods. There are more than 2,500 species, or kinds, of centipede. There are about 10,000 species of millipede.

Where Centipedes and Millipedes Live

Centipedes and millipedes live all over the world, but they are most common in the tropics. Most types like dark, moist places. The house centipede of North America and Europe lives in buildings.

The name centipede means “hundred-footed,” but only some centipedes have that many legs. Others have fewer, and some have as many as 354.

Physical Features

Centipedes and millipedes have long, thin bodies that are divided into segments, or sections. They range in length from just 0.08 inch (2 millimeters) to 12 inches (30 centimeters). Millipedes are generally smaller.

In a centipede, every body segment except the head and the rear has one pair of legs. Centipedes may have from 14 to 177 pairs of legs. In a millipede, the three segments behind the head have only one pair of legs. Every other segment has two pairs of legs. No millipede has more than about 200 pairs of legs.

Most kinds of centipedes and millipedes have only a few body segments when they hatch. They add segments each time they go through a process called molting, when they shed their hard outer covering.

Behavior

Centipedes hide during the day and come out at night to hunt. They kill their prey with poisonous claws. Centipedes usually eat insects, spiders, and other centipedes.

Most types of millipedes eat rotting plant material. They are equipped to protect themselves rather than to attack. Some types have special glands that produce a smelly or poisonous liquid or gas. Others curl up into a ball for protection.

Central African Republic

The country of the Central African Republic is located in the heart of Africa. Bangui is the capital.

The Central African Republic is surrounded by Chad, Sudan, the Democratic Republic of the Congo, the Republic of the Congo, and Cameroon. Most of the country occupies a plateau, or flat raised area. Mountains rise in the north and the west. The country has a tropical climate with rainy and dry seasons each year.

Savanna, or grassland with scattered trees, covers much of the north. Antelope, baboons, buffalo, elephants, and black rhinoceroses live in the savanna. Dense rain forests in the south are home to gorillas, chimpanzees, leopards, and bongos (striped antelope). Crocodiles and hippopotamuses live in the rivers.

There are more than 80 ethnic groups in the Central African Republic. Major

groups include the Gbaya, the Banda, and the Mandjia. Sango is the most commonly spoken language. Both Sango and French are official languages. Most of the people live in the south and the west. Most people follow Christianity, though many practice traditional African religions or Islam.

Farming is the major economic activity of the Central African Republic. Crops include cassava, yams, peanuts, bananas, and corn. The country also produces wood, cotton, and coffee to sell to other countries. Diamonds and gold are the only minerals that the Central African Republic produces.

Many peoples lived in this region for thousands of years before Europeans arrived. France gained control of the area in the 1800s. In 1906 France united the region with Chad to form a colony named Ubangi-Shari-Chad. In 1910 the region became part of French Equatorial Africa, which also included Chad, Congo, and Gabon.

In 1960 the Central African Republic declared independence from France. Harsh dictators and the military ruled until 1993, when the country held its first democratic elections. Political troubles continued into the 21st century, however.

Central America

Central America is a narrow strip of land that lies at the southern end of North America. It connects that continent with South America. The region consists of seven countries: Belize, Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, and Panama.

Land and Climate

No place in Central America is more than 125 miles (200 kilometers) from the sea. The Pacific Ocean lies to the southwest, and the Caribbean Sea lies to the northeast.

The land is mostly mountainous and rugged. The highest point in Central America is the volcano Tajumulco in Guatemala, near the border with Mexico. It reaches 13,845 feet (4,220 meters).

Low-lying plains are found in the north, along the coasts, and near Lake Nicaragua. This lake is the largest body of water in Central America.

Central America lies within the tropics, or the warm areas near the equator. The lowlands generally have hot weather. The highlands are mild or cool. More rain falls during the summer than in winter. The Caribbean side is wetter than the Pacific side.

Plants and Animals

Tropical rain forests grow in the lowlands of eastern Central America. In the highlands the forests include pines and oaks. Cloud forests grow at elevations of about 6,000 feet (1,800 meters). These forests, which are nearly always dripping wet, include evergreen oaks, laurels, and orchids. Shrubs and low trees grow in higher places.

Central America's wild animals include the jaguar, the ocelot, the puma, the coyote, and the gray fox. A variety of monkeys live in the forests. Among the region's birds are colorful parrots, big-billed toucans, and long-tailed quetzals.

People

About three fifths of the people have a mixture of Amerindian (Native Ameri-

Capuchin monkeys live in some of the rain forests of Central America.

Women in traditional dress gather in a busy market in Guatemala.

can) and European ancestors. About one fifth of Central Americans are fully Amerindian. Smaller numbers of people have mainly European, African, or Asian roots.

Spanish is the official language of all Central American countries except Belize. In Belize English is the official language. Many people speak Mayan and other Amerindian languages, especially in Guatemala.

Roman Catholic Christianity is the main religion in Central America. Some groups mix Christianity with Amerindian religions.

Education is better in Panama and Costa Rica than in Guatemala and other northern countries. Medical care also tends to be poorer in the north.

Economy

Central American countries grow several crops to sell to outside countries. The three most important crops are coffee, bananas, and sugarcane. Many small

farmers grow corn, beans, and squash for local markets.

Central American industries process food, beverages, and tobacco. They also produce clothing, shoes, drugs, chemicals, cement, paper, and wood products. Tourism and other services are also important to the economies of Central America.

History

Humans have lived in Central America for thousands of years. Between 4000 and 1000 BC, groups of Amerindians began to settle in certain places and farm the land. Some of these people, called the Maya, eventually built a great civilization. Mayan culture reached its peak between about AD 250 and 900.

European explorers arrived in Central America in the 1500s. Spanish conquistadors, or conquerors, soon took control of the region. The Amerindian population, weakened by new European diseases, fell quickly.

Tourists climb the ruins of a Mayan temple in present-day Guatemala.

The Spanish ruled most of Central America as provinces of the Kingdom of Guatemala. This colony also included parts of southern Mexico. It did not include Panama. The Spanish ruled Panama first from Peru and later from Colombia. The only other European rulers in the region were the British. The British claimed Belize (at first called British Honduras) in the 1700s.

Central America gained its independence from Spain in 1821. Guatemala, Honduras, El Salvador, Costa Rica, and Nicaragua briefly joined Mexico. In 1823 they again declared independence and formed the United Provinces of Central America. Guatemala City was the capital. By 1840, however, each member state had gone its separate way. Panama remained part of Colombia until it gained independence in 1903. (Belize did not gain independence from Great Britain until 1981.)

The new countries experienced political troubles from the 1800s into the 1900s. They disagreed about where their borders should be. Civil wars broke out. Many dictators (leaders with unlimited power) ruled harshly. The United States sent in troops several times. By the end of the 1900s, however, democratic governments had begun to develop in Central America.

Ceramics

Ceramics are hard objects that people make from inorganic materials, or materials that did not come from plants or animals. Ceramics have many useful characteristics. In general they are strong, although they may be brittle, or easily breakable. Heat, water, air, and chemicals do not easily damage them. In addition, they usually do not conduct, or pass along, electricity.

Traditional ceramic objects are made from clay or other minerals that come from the ground. This type of ceramics includes pottery and bricks. People have been making these types of objects for thousands of years.

Today scientists and engineers make ceramics out of many different materials. These modern ceramics have many uses. Computer chips, cars, pens, and faucets may have ceramic parts. Dentists use ceramics to fix teeth. Special ceramic tiles protect space shuttles from the tre-

Cerebral Palsy

Cerebral palsy is a disability caused by a certain kind of brain damage. The word cerebral refers to a part of the brain called the cerebrum. This part of the brain controls the movement of muscles. The word palsy means a kind of paralysis, or loss of movement. Thus, people with cerebral palsy have trouble controlling the movements of their muscles.

A boy with cerebral palsy has a guide dog to help him with everyday activities.

The muscles of people with cerebral palsy may be weak, or they may twitch. Some muscles may also “freeze” in a certain position. This lack of muscle control can make standing, walking, and talking difficult. Some children with cerebral palsy have mental disabilities, but many do not.

There is no single cause of cerebral palsy. In most cases the exact cause is unknown. The brain damage that leads to the disability most often happens while a baby is developing inside the mother. The damage may occur because the brain is deformed or because it does not get enough oxygen. An infection in the mother, such as rubella, is another possible cause.

Babies can also develop cerebral palsy after they are born. Severe head injuries sometimes lead to cerebral palsy. Such infections as meningitis may also cause cerebral palsy.

There is no cure for cerebral palsy. Medicines can help to control unwanted muscle movements. Leg braces and physical therapy (special exercises) can improve a person's balance and movement. Speech training can sometimes develop a person's speaking abilities.

Did You Know?

The first signs of cerebral palsy usually appear before age 3.

Chad

Located in north-central Africa, the Republic of Chad links Arab North Africa with the cultures south of the Sahara Desert. The capital is N'Djamena.

Chad is surrounded by Libya, Sudan, the Central African Republic, Cameroon, Nigeria, and Niger. Lake Chad lies in the west. Mountains rise in the north, east, and south. The Sahara runs across the north. Central Chad is part of the semidry Sahel region. The southern plains are tropical. Most of Chad is hot, with rainy and dry seasons.

Facts About CHAD

The Sahara has little vegetation and wildlife—mainly antelope, gazelles, and ostriches. In the Sahel thorny shrubs, acacia trees, and grasses grow. Elephants, hippopotamuses, rhinoceroses, warthogs, giraffes, antelope, lions, leopards, and cheetahs live in the Sahel. Tropical grasses and scattered trees grow in the south.

Chad has more than 200 ethnic groups. The largest group is the Sara, followed by Arabs. Most of the people live in rural areas. The official languages are French and Arabic, but more than 100 different languages are spoken. More than half of the people are Muslims, and about one third are Christians.

Agriculture is Chad's main economic activity. Farmers grow peanuts, sorghum, millet, cassava, and yams. They raise cattle, goats, and sheep. Trade is

also important to the economy. Chad produces and sells cotton, textiles, and petroleum (oil).

Various peoples lived around Lake Chad beginning in prehistoric times. In the 700s people known as Berbers from North Africa began to arrive. They founded an empire called Kanem-Bornu, which controlled the region until the 1800s. In 1910 France made the region part of French Equatorial Africa. In 1946 Chad became an overseas territory of France.

Chad gained independence in 1960. Civil war soon broke out between different political groups. Chad held presidential elections in the 1990s, but political fighting continued.

Chalk

Chalk is a soft, whitish rock. It is a type of limestone. Like other forms of limestone, it is made from animal shells and takes many years to form. It has many uses.

Chalk is found throughout much of northwestern Europe. England's famous white cliffs of Dover are made from chalk. In the United States, chalk deposits are found in Arkansas, Louisiana, Texas, and Wyoming.

Chalk is made from the shells of tiny sea creatures. When these animals die, their shells sink to the sea floor. Mud covers the shells. Layers of shells and mud slowly build up. A chalk deposit forms when this material hardens. The whole process can take millions of years. Sometimes the water level drops. When this happens, the chalk can rise above the water's surface. This is how chalk cliffs are formed.

Chalk is white or gray. It is also porous. This means that rain and other water can get into it. After many years, lots of

rain can collect in an area of chalk. Some cities get their drinking water from these collections of water. Oil and natural gas also collect in chalk.

Chalk is very useful. Powdered chalk is used in toothpaste and stomach medicines. Chalk is also used to make such products as paint, rubber, and cement. Artists draw with chalk. Teachers write on blackboards with chalk. However, the chalk used by artists and teachers is sometimes not true chalk. It is often mixed with other ingredients or it is made from a mineral called gypsum.

Limestone • Rock

Chameleon

The lizards called chameleons are well-known for being able to change the color of their skin. Chameleons live in Africa, Asia, and Europe. The lizards that are commonly sold as chameleons in North American pet shops are actually anoles. Anoles also change color but not as strikingly as true chameleons do.

Most chameleons live in trees. Their toes are divided into two groups to help them grasp branches. They do not move well on the ground. They spend as little time as possible there.

Chameleons range in length from about 1.5 inches (4 centimeters) to 24 inches (60 centimeters). Most chameleons are 7–10 inches (17–25 centimeters) long.

Did You Know?

A chameleon can look in two directions at once because it can move each eye separately.

Cliffs made of chalk, a type of limestone, line the southeastern coast of England.

A panther chameleon's V-shaped toes help it grasp tree branches.

Chameleons can change color because they have special cells under their skin. Inside these cells color particles move around. The chameleon takes on the color of whichever particles are packed together most closely. Green, yellow, and brown are common chameleon colors.

Many people think that chameleons change color to blend in with their surroundings, but this is not true. Instead, color changes depend on such factors as temperature, light, and emotions such as fear and anger. Chameleons also use color changes to communicate with each other.

Like most lizards, chameleons eat insects. They use their long, sticky tongues for catching prey. Large chameleons also eat young birds.

Champlain, Samuel de

The French explorer Samuel de Champlain traveled along the seacoasts, lakes, and rivers of North America in the early 1600s. Known as the Father of New France, he founded the city of Quebec and encouraged French settlement in what is now Canada.

Champlain was born in 1567 in Brouage, a small French port. His father was a sea captain. Young Samuel learned navigation from him and led voyages to the West Indies and Central America.

In 1603 Champlain made his first visit to New France, the lands the French claimed in North America. He returned in 1604 with a group of settlers who started a colony in what is now Nova Scotia. Though the colony failed, Champlain used his time there to explore the Atlantic coast as far south as what is now Rhode Island.

Samuel de Champlain

Champlain sailed to Canada again in 1608 and founded Quebec as a trading post on the Saint Lawrence River. It was the first lasting French settlement in North America. Champlain made friends with the Huron people of the region. In 1609 he traveled south with the Huron to fight the Iroquois in what is now New York. There he came upon the lake that is now called Lake Champlain. In 1615, on yet another trip, he reached Lake Huron. He was the first European known to reach the Great Lakes.

In 1628 the English seized Quebec during a war with the French. Champlain was captured and taken to England. After the war he returned to Quebec. He died there on December 25, 1635.

Charlemagne

As leader of the kingdom of the Franks, Charlemagne united many of the Christian lands of western Europe during the Middle Ages. He was declared the emperor of this collection of states, which eventually came to be called the Holy Roman Empire. He was a great warrior, but he also respected and preserved learning. His name means Charles the Great.

Early Life

Charles was born in about AD 742. He was the elder son of Pippin III. Unlike most people of his day, Charles learned to read. He also formed a lifelong devotion to the Christian church.

Charles's father became king of the Franks in 751. At that time Europe consisted of many independent

A picture from the 1400s shows Emperor Charlemagne.

kingdoms that had grown up after the Roman Empire collapsed in the 400s. The Franks occupied what is now France and some surrounding regions. Pippin's army aided the pope, who was the head of the church, in several campaigns against a tribe called the Lombards. Young Charles learned from his father's efforts.

Conquests

Pippin died in 768 and Charlemagne's brother died in 771. After that, Charlemagne ruled the Franks. He also began to conquer the other tribes around him. Charlemagne met defeat in northern Spain against the Muslims in 778, but he defeated the Lombards in Italy and eventually the Saxons of central Germany.

Charlemagne made his capital in western Germany at Aachen (known to the French as Aix-la-Chapelle). On Christmas day of 800, Pope Leo III crowned him emperor of the West. Charlemagne

then attempted to restore much of the unity of the old Roman Empire.

Influence

Charlemagne was a great reformer. He set up a money system to promote trade, built roads and bridges, and encouraged better farming methods. He invited scholars to his court, collected books, and founded a school.

Charlemagne died in 814 and was succeeded by his son Louis. Louis died in 840 and his three sons split up the empire. Even so, the Holy Roman Empire survived—in one form or another—for nearly 1,000 years.

Charles, Ray

Music lovers call Ray Charles the Genius. Charles was a gifted singer and piano player who also wrote music. He blended gospel, rhythm and blues, and jazz to create a new form of music called soul.

Ray Charles

Ray Charles Robinson was born on September 23, 1930, in Albany, Georgia. (He later dropped his last name, Robinson.) He grew up in Florida. Ray began losing his sight at a young age. By age 7 he was blind. He studied music at the School for the Deaf and Blind in Saint Augustine, Florida.

In the late 1940s Charles played piano for blues and jazz bands. In the 1950s he started making records. His hit songs included “What’d I Say”; “Georgia on My Mind”; “Hit the Road, Jack”; and “I Can’t Stop Loving You.” Beginning in 1955 Charles toured throughout the United States and in other countries.

Charles won 13 Grammy awards for his recordings. In 1986 he was voted into the Rock and Roll Hall of Fame. Charles died on June 10, 2004, in Beverly Hills, California.

Charleston

Population
(2000 census)
53,421; (2007
estimate)
50,478

Charleston is the capital of the U.S. state of West Virginia. It is the state’s largest city. Charleston lies on the Kanawha River.

The state Capitol in Charleston, West Virginia, faces the Kanawha River.

Charleston is the economic center of a region rich in minerals. Coal, oil, and natural gas are shipped out from the city. Services, such as government and health care, and manufacturing are important to the economy.

A town was established at the site in the late 1700s. The town grew because it was on a popular river route to the Ohio Valley. For many years Charleston was an important center for salt mining. In 1862 Charleston was the site of a battle during the American Civil War. The following year West Virginia became a separate state from Virginia. In 1877 Charleston was named the permanent capital of West Virginia.

Chavez, Cesar

As a child Cesar Chavez was a migrant worker, moving from place to place to work on farms. As an adult he helped improve the lives of migrant farmwork-

Cesar Chavez

ers in the United States by organizing them into a labor union.

Cesar Estrada Chavez was born on March 31, 1927, near Yuma, Arizona. During the Great Depression of the 1930s his family became migrant farmworkers in California. By age 15 Cesar was working full-time in the fields. During World War II he served in the U.S. Navy.

In 1952 Chavez joined a group that helped Hispanic people in California and encouraged them to vote. In 1962 Chavez and Dolores Huerta founded a labor union called the National Farm Workers Association. In 1971 the union became known as the United Farm Workers of America (UFW).

Chavez led protests to call attention to the problems of migrant workers. In the mid-1960s he launched a strike by California grape pickers that lasted five years. During the strike Chavez got

people across the country to stop buying California grapes. By 1970 most grape growers had signed contracts that improved wages and benefits for their workers. Chavez also led battles against lettuce growers and other farm businesses. Chavez served as president of the UFW until his death on April 23, 1993.

Cheetah

The cheetah is the fastest land animal on Earth. This spotted member of the cat family can sprint faster than 70 miles (112 kilometers) per hour. The cheetah's scientific name is *Acinonyx jubatus*.

Where Cheetahs Live

Cheetahs live in the wild in scattered parts of central, eastern, and southern Africa. A small number of wild cheetahs live in Iran. Most cheetahs live in grasslands and dry, open areas.

Physical Features

Small black spots cover most of the cheetah's sandy yellow fur. The belly is white, and the tail is marked with dark

A cheetah sprints through the grass in Kenya.

rings. Black lines run from the eyes to the corners of the mouth.

The cheetah measures about 6.5 feet (2 meters) long, from the head to the tip of the tail. It is a slender mammal that weighs about 75 to 120 pounds (34 to 54 kilograms). Males tend to be larger than females.

A cheetah's body is built for speed. Long legs allow the cheetah to take big strides. Hard paws and exposed claws help it to grip the ground. The cheetah is the only kind of cat that cannot pull its claws completely back.

Behavior

Cheetahs live alone or in small groups. They hunt small animals, mainly during the day. After creeping up on an animal, a cheetah sprints at it from a few hundred feet away. The cheetah can keep up the chase for only a short time before tiring. When the cheetah does catch its prey, it trips the animal and bites into it.

Life Cycle

About three months after mating, a female cheetah gives birth to two to eight cubs. Cheetah cubs stay with their mother for more than a year while they learn to hunt. Some cheetahs in zoos have reached the age of 19, but most do not live that long.

Cheetahs and Humans

The ancient Egyptians and some rulers of India and Europe tamed cheetahs. They used the animals for hunting. Other

peoples hunted cheetahs for their fur. Eventually, wild cheetahs disappeared from India and many other places. Today cheetahs are in danger of dying out completely. Human settlements have taken over much of their land.

Chemical Element

A chemical element is a basic substance. It cannot be broken down into simpler substances by ordinary chemical processes. Chemical elements are the building blocks for all matter—that is, everything that takes up space in the universe. They are sometimes just called elements.

There are 92 chemical elements found in nature. Scientists have created more than 20 additional elements. Some elements are much more common than others. One common element is nitrogen. It is the major element in air. The elements combine to form substances called chemical compounds. For example, water is a chemical compound. It is formed by the combination of the elements hydrogen and oxygen.

Element Symbols

Every element has a symbol. The symbol for some elements is the first letter of its name. For example, H is the symbol for hydrogen and O is the symbol for oxygen. Other elements have a symbol with

The periodic table groups elements by their properties.

two letters. For example, He is the symbol for helium and Cl is the symbol for chlorine.

Elements and Atoms

The smallest unit of an element is called an atom. Each element is made up of only one type of atom. Atoms, in turn, are made up of tiny particles, or bits, called protons, neutrons, and electrons. All atoms of an element have the same number of protons. This number is called the atomic number of the element. For example, the atomic number of hydrogen is 1 because a hydrogen atom has one proton.

Periodic Table

In 1869 a Russian scientist named Dmitry Mendeleev grouped the elements in a table. It is called the periodic table. The periodic table arranges the elements in rows and columns. In the

rows, the elements are placed in order of their atomic number. The columns form groups of elements that have similar chemical properties. The periodic table helps chemists think about the elements and their properties.

Chemistry

Chemistry is one of the major branches of science. People who work in chemistry are called chemists. Chemists study the substances that make up matter—everything that takes up space in the universe. They also study the changes that take place when substances are combined. These changes are called chemical reactions.

In addition, chemists create new substances. They have made plastics, fibers,

Students of chemistry learn about the substances that make up matter. They also study the changes that take place during chemical reactions.

building materials, medicines, and many other substances that are useful in everyday life.

Elements and Compounds

The basic substances that chemists study are called chemical elements. Each element is made up of tiny particles, or bits, called atoms. Chemical reactions involve atoms or groups of atoms. When two or more atoms combine, they form a molecule.

Each element has certain properties, or characteristics. When elements are combined, they form a new substance with its own properties. A substance formed in this way is called a compound. There are a little more than 100 elements. But there are millions of compounds.

Fields of Study

Chemistry is a complex subject with many fields of study. For example, organic chemists deal only with compounds of the element carbon. Physical chemists measure the way that substances change during chemical reactions. Biochemists study chemical processes that happen in living things.

History

People first studied chemistry as a science in the 1600s. In 1661 a British scientist named Robert Boyle described chemical elements as simple, basic substances. In the 1770s a French chemist named Antoine Lavoisier helped to explain chemical reactions.

In the early 1800s a British chemist named John Dalton found that each element has its own kind of atom. Other chemists discovered many new elements during the 1800s.

Later chemists continued to make discoveries about atoms. For example, they learned that atoms are made up of even simpler particles.

Did You Know?

People called alchemists worked with chemicals before chemistry became a science. They tried to change lead into gold. They failed, but they learned about elements in the process.

Cherokee

The Cherokee are the largest Native American group in the United States. They once lived around the Great Lakes. After battles with other tribes, they moved to what is now the southeastern

Cherokee dancers perform at a Native American celebration.

United States. Today they live mostly in Oklahoma.

The Cherokee traditionally grew corn, beans, and squash. They hunted deer, bear, and elk. They lived in log cabins with roofs made of bark.

Europeans arrived in Cherokee territory in the middle of the 1500s. By that time the Cherokee lived in the Southeast. Over the next 200 years the Cherokee lost much of their land and power to white settlers.

After 1800 the Cherokee took on some parts of white culture. They formed a government based on that of the United States. A man named Sequoyah created a writing system for the Cherokee language. Most Cherokee learned to read and write. Whites called the Cherokee one of the Five Civilized Tribes, along with the Choctaw, the Seminole, the Chickasaw, and the Creek.

In the 1830s gold was discovered on Cherokee land in Georgia. Georgia offi-

cials and the U.S. government forced the Cherokee to leave their land and march west. About 4,000 Cherokee died on the journey, which is called the Trail of Tears.

Most Cherokee settled in what is now northeastern Oklahoma. Their descendants still live there. Some Cherokee live in western North Carolina. They are descendants of Cherokee who escaped into the mountains in the 1830s. In the late 20th century there were more than 280,000 Cherokee living in the United States.

Cherry

Cherries grow on stems that hang from tree branches.

Cherries are small, round fruits that can be sweet or sour. They grow on trees

that are common in North America, Europe, and eastern Asia.

Different types of cherry tree produce sweet cherries and sour cherries. Sweet-cherry trees are large, reaching heights up to 36 feet (11 meters). Their fruit is usually round or heart-shaped. Sweet cherries vary in color from yellow to red to nearly black. People eat sweet cherries fresh or canned.

Sour-cherry trees are smaller than sweet-cherry trees. They are usually less than 16 feet (5 meters) tall. Sour cherries are round and smaller than sweet cherries. They are usually dark red. Sour cherries are not eaten fresh because of their sour taste. They are frozen or canned and used in sauces and pastries, such as cherry pie.

Some kinds of cherry tree do not bear fruit. But people like these trees for the beautiful pink and white flowers they bear. Many cherry trees are planted in gardens and parks, especially in Japan.

The wood of cherry trees is valued for its rich red color. People use cherry wood to make cabinets, furniture, and other products.

Chestnut

Chestnuts are tall trees that produce sweet-tasting nuts and useful wood. There are four species, or types, of chestnut tree: American, European, Chinese,

Tall chestnut trees provide welcome shade to an avenue.

and Japanese. They are related to oak and beech trees.

Chestnut trees can grow to a height of about 100 feet (30 meters). The bark has deep grooves. The leaves are shiny green and oval-shaped with pointed edges. The nuts are found inside green, cup-shaped structures with a spiky shell. Each holds two or three nuts.

The American chestnut tree was once common in eastern North America. However, in the 1900s a disease called chestnut blight killed almost all the American chestnuts. The blight also attacks the European chestnut. It does not affect Chinese or Japanese chestnuts.

Some of the trees called chinquapins are closely related to the chestnuts. But their fruits contain only one nut. Other plants that are called chestnuts are not related to the true chestnuts. These include horse chestnut trees, which bear nuts that are not usually eaten. Water

chestnuts are water plants that produce a nutlike fruit.

Cheyenne

Members of the Cheyenne tribe of Native Americans perform at a festival in Washington, D.C.

The Native American people known as the Cheyenne originally were farmers. Later, however, they became traveling bison (buffalo) hunters. They spoke an Algonquian language.

Before 1700 the Cheyenne lived in the upper Mississippi River valley, in what is now Minnesota. There they farmed, gathered wild rice, and made pottery. They later moved west to what is now North Dakota. It was probably there that they first got horses, which changed their way of life. The Cheyenne began to hunt bison on horseback. They ate bison meat, used the bones for tools, and made clothing and tepees from the skins. To follow the herds, the Cheyenne gradually

abandoned their villages and gave up farming.

The Cheyenne eventually spread across much of the Great Plains. In the 1830s many Cheyenne moved south to what is now Colorado. The tribe divided into northern and southern branches. The Northern Cheyenne continued to roam the plains, but the Southern Cheyenne chose a more settled lifestyle. From the 1850s through the 1870s the Cheyenne fought with U.S. soldiers and settlers heading west. At the end of the 20th century the Cheyenne population was about 11,000, mostly in Oklahoma and Montana.

States. Many of the first residents of Cheyenne went there to help build the railroad. Cheyenne became the capital of the Wyoming territory in 1869. The territory became a state in 1890.

Cheyenne was an outpost of the Wild West. Cowboys drove cattle north from Texas to the railroad at Cheyenne. Cattle were also raised on nearby ranches. In the 1870s Cheyenne became a supply center for the area's gold miners. Gunfighters, gamblers, and other colorful characters roamed the city.

Today Cheyenne takes pride in its Old West heritage. Every July the city holds a famous rodeo.

Chiang Kai-shek

The Chinese leader Chiang Kai-shek helped to overthrow the last emperor of China. He later fought for control of the country as head of the Nationalist Party.

Chiang Kai-shek was born on October 31, 1887. He studied military science in Tokyo. There he became a follower of the Chinese revolutionary leader Sun Yat-sen.

Chiang returned to China in 1911. He took part in a revolution that overthrew the ruling Qing, or Manchu, Dynasty and made China a republic. However, for several years after that there was no stable government as military warlords struggled for power.

After a period of study in the Soviet Union, Chiang returned to China in 1923. Two years later he followed Sun as head of the Kuomintang (Nationalist Party). During this period Communists were part of the Nationalist Party, but in 1927 Chiang forced the Communists to leave. He also moved against the warlords and in 1928 established a new government. The warlords as well as the

Chiang Kai-shek

Communists continued to oppose him, however.

When Japan invaded China in 1937, Chiang formed a temporary alliance with the Communists to fight the invaders. Their fight became part of the larger conflict of World War II. After the Japanese surrendered in 1945 the Communists moved against Chiang again. By 1949 they had defeated him and established the People's Republic of China. Chiang moved his Nationalist government to the island of Taiwan. He died on April 5, 1975.

Chicago

Population
(2000 census),
city, 2,896,016;
(2007 estimate)
2,836,658

Chicago, Illinois, is the third largest city in the United States. Only New York City and Los Angeles, California, have more residents. Chicago is a center of industry, transportation, culture, and education. The modern skyscraper was born in Chicago. The city has some of the world's tallest buildings, including

Visitors to Chicago's Millennium Park can see a giant reflecting sculpture by Anish Kapoor. The pieces of curled metal in the background are part of a music pavilion designed by the architect Frank Gehry.

the Willis Tower (formerly called the Sears Tower) and the John Hancock Building.

Chicago is in the Midwest region of the United States. The city lies on Lake Michigan, one of the five Great Lakes. Beaches and parks line the lakefront.

Culture

The arts are a significant part of life in Chicago. The city has many museums and theater companies. The Chicago Symphony Orchestra and the Art Institute of Chicago are world famous. Outdoor concerts, including large blues and jazz festivals, are held at Grant Park and Millennium Park.

Sports are also important to city life. Chicago's devoted fans cheer on the Cubs and White Sox (baseball), the Bulls (basketball), the Blackhawks (hockey), and the Bears (football).

Economy

Chicago's economy is based on many different industries and services. Many people in the city work for the government or in banking, trade, or tourism. The major industries include food processing, publishing, and making paper products, electronics, and chemicals.

History

Native Americans were the first people to live in the Chicago area. A black trader named Jean-Baptist-Point du Sable settled in the area in the 1770s. A U.S. fort and a settlement were later established there.

Chicago's industries and population grew rapidly in the 1800s. Its location on Lake Michigan and in the middle of the country helped it become a center of trade and transportation.

In 1871 a terrible fire destroyed about a third of Chicago. The city rebuilt

quickly, however. Many skyscrapers soon sprang up downtown. In 1893 Chicago hosted a huge fair called the World's Columbian Exposition. More than 21 million people visited the fair.

In the 1900s many Chicago residents moved to the suburbs. Starting in the 1990s, however, building projects brought new life to the city.

Chickasaw

The Chickasaw are a Native American tribe that originally lived in what is now the southeastern United States. Their traditional homeland was centered in what is now northern Mississippi, but it also included parts of what are now Alabama, Tennessee, and Kentucky.

Chicago has some of the world's tallest buildings. They are close to the shoreline of Lake Michigan.

The Chickasaw made rattles for religious purposes. They used such natural materials as turtles' shells, cows' horns, and gourds.

The Chickasaw built their houses by covering a pole frame with grass, bark, or hides. They spread the houses out along riverbanks instead of clustering them in villages. They got their food by farming and hunting.

In the 1540s the Spanish explorer Hernando de Soto and his men met the Chickasaw. The Chickasaw drove the explorers from their territory. The tribe was more welcoming to English traders who arrived in the 1700s. The Chickasaw often sided with the English in their battles with French traders and settlers.

The relationship between the Chickasaw and the United States became strained when Americans began moving into their territory. In the 1830s the U.S. government forced the Chickasaw to move to Indian Territory (now Oklahoma) along with the Creek, the Cherokee, the Choctaw, and the Seminole. Because they adopted certain European

customs, these tribes came to be known as the Five Civilized Tribes. In 1855 the Chickasaw established a separate nation. In 1907 the Chickasaw Nation became part of Oklahoma. There are now about 20,000 Chickasaw in the United States. About half still live in Oklahoma.

Chicken

The chicken is a bird that people all over the world raise for its meat, eggs, and feathers. It belongs to the group of domesticated, or tame, birds called poultry.

Chickens have short wings and a heavy body. This makes it hard for them to fly very far. Male chickens are called roosters. Roosters often have brightly colored feathers. They can be red, green, brown,

Male chickens are called roosters. They do not lay eggs.

black, or other colors. Female chickens are called hens. Hens are usually brown or white. Both males and females have one or two wattles. A wattle is skin that hangs from the throat. Male and female chickens also have a comb, which is skin that sticks up from the top of the head.

Farmers usually keep chickens inside large, modern buildings. They feed the birds corn and other grains. Some farmers allow their chickens to roam free outdoors. These chickens usually roost, or sleep, inside at night.

Hens can lay more than 200 eggs a year. If a hen mates with a rooster before laying eggs, the eggs will be fertilized. This means that they will develop into chicks. But hens can lay eggs without mating. These unfertilized eggs are the eggs that people eat.

Wild birds called jungle fowl are the ancestors of chickens. Jungle fowl belong to the pheasant family. They live in parts of Asia, including India. Jungle fowl eat seeds, fruit, and insects. They fly into trees to escape from predators.

Chicken Pox

One of the most common diseases of childhood is chicken pox. Although most people contract it between the ages of 2 and 6, chicken pox can strike at any age. It is a fairly mild illness in children, but it can be serious in adults.

Itchy, red spots on the face and body are a sign of chicken pox.

The first symptoms, or signs of the disease, include a slight fever, runny nose, and mild cough. The person will not feel hungry and may also have headaches and feel tired.

Roughly two weeks after being exposed to the virus that causes the disease, red spots appear on the face and body. These spots are filled with fluid, and they itch terribly. Eventually the spots form scabs, which soon fall off.

People with chicken pox should try not to scratch the spots. The itching can be relieved by using medications such as calamine lotion. It is important to keep the spots clean.

It is extremely important to never use aspirin to treat the headaches and body aches that accompany chicken pox. Using aspirin to treat chicken pox has been connected to the development of a severe disease called Reye's syndrome.

A case of chicken pox generally lasts from a week to 10 days. Because chicken

Did You Know?

Child Development

People live much longer than most other animals, so human childhood also lasts a long time. Unlike baby animals, human children need many years to learn how to live on their own as adults. As children's bodies grow, so do their minds. This growth is called child development. People who study child development learn how children change, from the time they are infants until they become teenagers, or adolescents.

Infants enjoy holding and looking at toys and other objects.

Children learning to walk need support to help them keep their balance.

There are several stages of child development. Babies go from being infants to toddlers to preschoolers. Then they enter school at 5 or 6 years old. At around 9, children are called preadolescents, or preteens. This last stage continues until a child becomes a teenager.

Infancy

Infancy is the most helpless stage of a human being's life. It takes an infant about three months just to grow strong enough to hold up its head. As their muscle strength increases, babies can do more. Over their first year infants gradually learn to roll over, sit up, crawl, and take their first steps with someone helping them. They become better at using their hands to grasp and hold things. As they grow out of infancy, babies begin to make sounds similar to words.

Toddlerhood

The toddler stage begins when a baby starts to walk, usually at about age 1. Most children also start saying words at about this time. As toddlers grow they become stronger and have more control of their bodies. Their thinking skills also improve. They slowly start putting words together to make sentences. They like to copy what other people say and do.

Preschool Age

Between ages 3 and 5, children are in the preschool stage. Children learn many important skills during this stage. They learn to share and to take turns. They learn how to play simple games with rules, such as tag. Playing with others helps them learn how to get along with all kinds of people.

School Age

Starting school marks a new stage. Children's minds develop quickly as they learn reading, writing, and arithmetic. They also learn more about cooperating with others. As their bodies grow stron-

Play is an important part of preschool children's development.

ger and more coordinated, many school-age children try sports or other difficult physical activities.

Preteen Years

Between 9 and 12 years old, children are preteens, or preadolescents. During this stage they grow much more independent. They become better at controlling their behavior. Preteens also understand how to be helpful to others.

During the preteen years children form close friendships. Their group of friends becomes very important to them. Family is no longer a central part of their life. Preteens also become more aware of the world beyond their home, school, and community.

The end of the preadolescent years marks the end of childhood. As preteens become teenagers, they move one step closer to becoming adults and living on their own.

Adolescence

Preteen children learn how to work together in activities such as music and sports.

Chile

The Republic of Chile stretches for nearly 2,700 miles (4,350 kilometers) along the west coast of South America. Though long, it has an average width of only 110 miles (180 kilometers). Its capital and largest city is Santiago.

Geography

The Pacific Ocean forms Chile's western border. Peru, Bolivia, and Argentina lie to the north and east. Chile claims a piece of Antarctica. It also controls several islands in the South Pacific, including Easter Island.

The Andes Mountains are in the east. Smaller mountain ranges are in the west. Flat plains lie between the two mountain systems. The mountains and plains run from north to south for nearly the entire length of the country.

The northern part of Chile is a very dry desert with moderate temperatures. The center of the country has hot, dry summers and cool, moist winters. Southern Chile is cold and wet.

Plants and Animals

Cacti and prickly shrubs grow on the northern coast. Hardwood trees, shrubs, cacti, and green grass grow in central Chile, though farmland has replaced many of the native plants there. Dense forests of beeches, evergreens, and monkey puzzle trees (Chile pines) cover the south.

Guanacos, llamas, alpacas, and vicuñas live in the northern Andes. Other mountain animals include deer, wolves, pumas, wildcats, rodents, and condors. The southern forests are home to foxes, small deer, and marsupials.

People

Most Chileans are mestizos, or people with both Spanish and American Indian roots. There are smaller groups of whites and Araucanian Indians. Most of the people speak Spanish and are Roman Catholic. Most Chileans live in cities in the central part of the country.

Folk music and dance are popular in Chile.

Economy

Banking and other services, manufacturing, mining, fishing, and trade are Chile's most important economic activities. The country produces and sells food products, metals, chemicals, and paper. Chile is the world's leading producer of copper. Chilean farmers grow wheat, grapes, apples, vegetables, and other crops.

History

Before the Spanish arrived in 1536, at least 500,000 American Indians lived in what is now Chile. The Araucanian Indians fought against the settlers for about 350 years. Meanwhile, the Span-

ish set up huge farming estates. A small class of people controlled most of the land, the wealth, and the political life of the country.

In the early 1800s Chile began fighting Spain for independence. Chile defeated Spain in 1817 and became independent in 1818. But Chile's wealthy landowners continued to dominate politics.

In the early 1900s many people demanded changes in government and society. A new constitution in 1925 gave Chile democratic elections and social programs. After a shaky start, Chile's government remained stable until the 1970s.

In 1973 the military overthrew President Salvador Allende. General Augusto Pinochet took power. Pinochet's government jailed, tortured, and killed many people who opposed it. In 1988 Pinochet allowed the people to vote on whether he should stay in office. They rejected him by a small majority. Elections in 1989 returned Chile to civilian (nonmilitary) rule.

Chimpanzee

Chimpanzees are apes that are closely related to bonobos—and to human beings. In fact, chimpanzees and bonobos are the closest living relatives of humans. Chimpanzees are very smart and social animals. They belong to the group of mammals called primates.

Where Chimpanzees Live

Chimpanzees are found in western, central, and eastern Africa. Most of them live in rain forests. But some chimpanzees live in drier grasslands and other areas.

Physical Features

Chimpanzees are usually about 3 to 5.5 feet (1 to 1.7 meters) tall. They generally weigh about 70 to 130 pounds (32 to 60 kilograms). The males are somewhat larger than the females. Chimpanzees'

The West African, or masked, chimpanzee is an endangered species. This means that it is in danger of dying out.

arms are longer than their legs. They have coats of brown or black hair. But their faces, large ears, hands, and feet are bare.

Behavior

Chimpanzees eat mainly plants, including fruits, leaves, and seeds. They also eat insects and birds' eggs. Sometimes chimpanzees hunt and eat monkeys and other mammals.

On the ground chimpanzees can walk upright on two legs. But more often they lean on their knuckles and walk on all fours. Chimpanzees spend time both in trees and on the ground.

Chimpanzees make and use a variety of simple tools. For instance, some chimpanzees chew certain leaves to make them spongy. Next, they push the leaves into tree hollows filled with water. They use sticks to get their leaf-sponges back out. Finally, they drink the water from the leaves. Young chimpanzees probably learn how to use tools by watching and imitating adults.

Chimpanzees live in groups of about 15 to 120 individuals, led by a male. They communicate with each other using facial expressions, gestures, and sounds. Members of a group are generally friendly toward each other but unfriendly to other groups. Sometimes one group will attack a smaller group and try to take its land.

China

More than one fifth of all the people in the world live in China. The country is also the largest in Asia. China's capital is Beijing.

Geography

China shares borders with Mongolia, Russia, North Korea, Vietnam, Laos, Myanmar, India, Bhutan, Nepal, Pakistan, Afghanistan, Tajikistan, Kyrgyzstan, and Kazakhstan. The Yellow, East China, and South China seas lie to the east. The Himalayan, Karakoram, and Altai mountain ranges separate China from its neighbors to the west.

The Plateau of Tibet in the southwest is a cold, mountainous region. The northwest is a highland with large desert basins. The east holds almost all of China's lowlands. China's major rivers are the Huang He, the Yangtze, and the Xi.

Plants and Animals

Forests cover about 15 percent of China's land. Among the many trees are tung, camphor, lacquer, and star anise trees. Mangrove swamps are found along the South China Sea. Rain forests grow in parts of southern China.

Giant pandas, Chinese paddlefish, and giant salamanders live in the wild only in China. Other animals and birds include tigers, monkeys, alligators, pheasants, and laughing thrushes.

People

The Han, or the ethnic Chinese, make up more than 90 percent of the population. Mandarin, a type of Han Chinese, is the official language. China has about 55 minority groups. For many years the government discouraged religion, but that began to change in the late 20th

century. Today many people follow traditional Chinese beliefs. Growing numbers practice Buddhism, Christianity, and Islam.

About 38 percent of the people live in cities. More than 40 cities have at least 1 million residents. The government has tried to control the growing population by asking families to have only one child.

Economy

China's Communist government once owned most of the businesses and farms in the country. Today individuals are allowed to own businesses. As a result the economy is growing steadily.

Mining and manufacturing are the most important economic activities. Mines produce zinc, lead, copper, iron ore, coal, and other minerals. Factories make cement, steel, iron, paper, chemicals, fabrics, electronic products, household

appliances, and cars. Service industries, including finance and health care, are becoming increasingly important.

Agriculture is a smaller part of the economy. However, it employs the largest number of workers. China is the world's top producer of rice. It also produces corn, wheat, soybeans, peanuts, fruits, vegetables, tobacco, cotton, pigs, and chickens.

History

Human ancestors lived in what is now China at least 400,000 years ago. By about 2000 BC people began living in settled groups and farming. Eventually those groups formed communities and then dynasties, or royal families, to rule over the communities.

Dynasties

The first dynasty for which there are written records was the Shang. It took

power over part of China in the 1700s BC. The Shang created bronze tools and written documents. Their neighbors, the Zhou, took over their territory in about 1050 BC. The Zhou Dynasty ruled a loose collection of states. The leaders of one of those states, the Qin, unified China in 221 BC. The Qin began to construct the Great Wall of China, which was more than 4,000 miles long.

From 202 BC to AD 1279, the Han, Sui, Tang, and Song dynasties ruled China. During that time the Chinese made advances in science, literature, and the arts. China also expanded its territory to include parts of Korea, Vietnam, Mongolia, and Tibet.

Foreign Invasions

The Mongols of Central Asia conquered all of China in 1279. It was the first time in history that foreign invaders had controlled the Chinese empire. The Ming Dynasty overthrew the Mongols in 1368. Another group, the Manchus,

Lanterns and flags decorate the old city wall of Xi'an, China.

took over as the Qing Dynasty in 1644. The Qing Dynasty continued until 1912. It was China's last dynasty.

Meanwhile, conflict with the West began with the first Opium War (1839–42). The British ran a profitable opium (a type of drug) trade in China. Many Chinese citizens became addicted to opium, and China wished to halt the trade. However, the British won the war as well as other battles. In the late 1800s

TIMELINE

The Shang Dynasty takes power over part of China.

1700s BC

The Mongols conquer China.

AD 1279

The Nationalists make China a republic.

1912

Mao Zedong begins the Cultural Revolution.

1966

The Qin Dynasty unites China.

221 BC

The native Ming Dynasty defeats the Mongols.

1368

The Communists form the People's Republic of China.

1949

The Forbidden City in China's capital city of Beijing contains the palaces of several former emperors. It is now a museum that is open to the public.

China also had disputes with France, Russia, and Japan.

Many in China disliked the growing foreign involvement. Many were also angry about poverty in the countryside. People around the country began to rebel. In the Boxer Rebellion of 1900, bands of Chinese attacked and killed at least 250 foreigners. After European, Russian, U.S., and Japanese forces put down the rebellion, those foreign powers gained even more control over China.

Chinese Revolution

Several Chinese groups continued to fight for change in the Qing Dynasty's weak government. They finally succeeded with a revolution that began in 1911. The last Qing emperor stepped down in 1912. Sun Yat-sen and his Kuomintang (Nationalist Party) declared China a republic. For several years, however, different leaders fought for control of China.

Did You Know?

Archaeologists have found decorated pottery that was created in China about 12,000 years ago.

Communism

In 1928 the Nationalists, a group led by Chiang Kai-shek, took control of China. During invasions by Japan in the 1930s and World War II (1939–45), however, the Chinese Communist Party grew strong. Civil war broke out between the Nationalists and the Communists, led by Mao Zedong. In 1949 the Communists defeated the Nationalists.

The Communists renamed the country the People's Republic of China. They set up a Communist government with Mao Zedong as its leader. In 1958 Mao started a program, called the Great Leap Forward, to modernize China's economy. The plan failed, however, and many people died of starvation. In 1966 Mao began the Cultural Revolution. Its goal was to strengthen people's belief in Communism. Instead it led to disorder and violence. Mao closed China's schools and encouraged young people to attack those who disagreed with him.

Recent Events

After Mao died in 1976, the Communist government began to relax its tight hold on Chinese society. Later leaders allowed private businesses and some freedom of speech. China also tried to improve relations with other countries. One sign of the country's success came in 2001. In that year the International Olympic Committee chose Beijing to host the 2008 Summer Olympic games.

Chinese New Year

Chinese New Year is a major holiday in China and Chinese communities throughout the world. Unlike in Western nations, the starting date of the Chinese New Year is not the same each year. It begins in late January or early February. The 15-day celebration begins with the new moon and lasts until the full moon.

Firecrackers are often shot off on New Year's Eve. Fireworks celebrate the end of the old year and the beginning of the new year. Chinese New Year is a time to feast and to visit family members. Many traditions of the season honor relatives who have died.

The last event of the 15-day celebration is the Lantern Festival. People often

hang glowing lanterns in temples or carry them during a nighttime parade. The dragon dance highlights festival celebrations in many areas. A long, colorful dragon is carried through streets by numerous dancers.

Chinese years are named after 12 animals: rat, ox, tiger, hare, dragon, snake, horse, sheep, monkey, fowl, dog, and pig. Chinese New Year marks the start of the next animal's year—for example, the Year of the Pig. After 12 years, the cycle of animals repeats itself.

Chipewyan

The Chipewyan are a tribe of Native Americans who once survived by hunting caribou in Canada. They ranged through the southern parts of what are now Nunavut and the Northwest Territories. Their range also included the northern parts of Alberta, Saskatchewan, and Manitoba.

The Chipewyan traveled in small bands and followed the caribou's migrations. Caribou were their main source of food. They also made clothing, tents, and nets from caribou skins. The Chipewyan did not farm but gathered food from plants that were growing wild.

Following the arrival of European fur traders in the late 1600s, the Chipewyan began to hunt for fur animals to exchange for European goods. The Europeans also introduced the Chipewyan to new diseases such as

Did You Know?

The Chipewyan religion included belief in dreams, visions, and guardian spirits.

smallpox. In 1781 an epidemic of smallpox killed most of the Chipewyan population.

The Chipewyan were further hurt by the decline of the fur trade in the 1800s. They eventually surrendered much of their land to the Canadian government and settled onto several small reserves in Alberta, Saskatchewan, Manitoba, and the Northwest Territories. By the end of the 20th century, there were about 5,000 Chipewyan living in Canada.

Chipmunk

Chipmunks are rodents that are closely related to squirrels. They look like squirrels but are smaller. Plus, chipmunks have stripes on their back, while squirrels do not.

There are 25 species, or types, of chipmunk. All species live in North America except for the Asiatic chipmunk. It is found in northern Asia and eastern Europe. Chipmunks live in many places, including woodlands, mountains, and plains.

Chipmunks are small. The eastern chipmunk is 5.5 to 7.5 inches (14 to 19 centimeters) long. Its bushy tail is more than half as long as its body. It weighs only about 2.5 to 5 ounces (71 to 142 grams). The western and Asiatic chipmunks are even smaller.

Chipmunks have different colors and stripes. The eastern chipmunk is reddish brown. It has five dark stripes on its back. Between the dark stripes are two brown and two white stripes. The gray western chipmunk has five dark stripes and four light stripes.

Most chipmunks are good tree climbers and swimmers. They eat nuts, seeds, wild fruits, and berries. Inside their cheeks are pouches. Chipmunks stuff these pouches with food to carry home.

The reddish brown eastern chipmunk lives in the forests of eastern North America.

Each chipmunk has its own burrow, or hole. It contains at least two rooms. One is a storeroom for nuts. The other is a leaf-lined nest. Chipmunks sleep during most of the winter.

Moldova

Chocolate

Chocolate is a food and a flavoring that is popular throughout the world. Many candies, baked goods, and drinks contain chocolate.

How Chocolate Is Made

Chocolate begins with the seeds of the cacao tree. The cacao tree grows in warm areas of North and South America, Africa, and Asia. The seeds form in long, cucumber-shaped fruits called pods. When the pods are ripe, workers cut them from the tree and remove the seeds. The seeds sit for several days before being dried, either by the sun or in an oven. The dry seeds, called cocoa beans, are then shipped to processing plants or chocolate factories.

At the plant or factory, workers roast the beans in giant ovens to bring out their flavor. Machines then remove the hard skin surrounding the beans. Next, machines grind the beans into a paste,

Chocolate bars contain cocoa butter and cocoa liquor made from the seeds of the cacao tree.

The seeds from cacao trees are dried to make cocoa beans (left). Cocoa powder is made from crushed cocoa beans.

called chocolate liquor. Chocolate liquor is made up of chocolate solids and a kind of fat called cocoa butter.

A dry powder called cocoa can be made by pressing some of the cocoa butter out of the chocolate liquor. Cocoa powder is sold unsweetened for use in baking and as a flavoring ingredient. It may also be mixed with sugar and milk to make hot chocolate drinks.

Chocolate for eating is made by adding extra cocoa butter to chocolate liquor. To make dark chocolate, workers add sugar to this mixture. Adding both sugar and milk makes milk chocolate. Mixing cocoa butter, sugar, and milk makes white chocolate. These mixtures may be poured into molds to make different shapes of candy.

History

Chocolate's popularity began in ancient Mexico and Central America, where the cacao tree grew wild. The Maya and Aztec peoples prepared a hot, bitter drink with cocoa beans. In 1519 the Aztec emperor Montezuma II served the Spanish explorer Hernán Cortés a chocolate drink called *xocoatl*.

Cortés brought this beverage back to Spain. With sugar, vanilla, and cinnamon added, it became a favorite with the Spanish kings and queens. In the 1600s the drink became popular among rich people in France and England.

In the 1800s people discovered how to make smooth, tasty chocolate for eating. Today the top chocolate-producing countries include the United States, the

United Kingdom, Switzerland, Germany, The Netherlands, and France.

Choctaw

The Choctaw are a large Native American tribe that once lived in what is now southern Mississippi. They were probably descended from earlier peoples known as mound builders.

Choctaw villages were clusters of houses made from wood frames covered with mud. The roofs were made from grass or cane reeds. Choctaw women tended fields of corn, beans, and pumpkins. They also gathered wild fruits and nuts. Men fished and hunted for deer and bear.

A painting from the 1800s shows Choctaw men playing a traditional ball game on a large field with tall goalposts.

In the 1540s the Choctaw drove Spanish explorers out of their territory. The tribe was friendlier to the French, who became valued trading partners. In the American Revolution (1775–83) the Choctaw sided with the Americans against the British. They adopted enough American customs to be regarded as one of the Five Civilized Tribes (along with the Chickasaw, the Seminole, the Cherokee, and the Creek).

In 1830 a small group of Choctaw agreed to give the United States their territory in the Southeast in exchange for land in Indian Territory (later Oklahoma). Most Choctaw did not want to leave, but U.S. troops forced them to make the trip. Thousands died on the march. By the late 1800s settlers had taken over much of the new Choctaw territory. In 1907 the land became part of Oklahoma. At the end of the 20th century there were about 87,000 Choctaw, mostly in Oklahoma and Mississippi.

Cholera

The disease called cholera is an infection of the small intestine. It causes the body to lose important fluids and minerals. Outbreaks of cholera have quickly killed many thousands of people.

Cholera is caused by a certain kind of bacteria. A person gets the disease by

A health worker shows a family in Afghanistan how to use tablets to make water safe to drink. Cholera can spread through contaminated water.

eating food or drinking water that has been contaminated, or infected, with the bacteria.

Diarrhea is usually the first symptom, or sign, of cholera. Vomiting follows the diarrhea. The body rapidly loses large amounts of water and other fluids. The result is a condition called dehydration. The person has a strong thirst and painful muscle cramps. If the dehydration is not treated, the patient may die within a few hours.

Doctors treat cholera mainly by replacing the body's lost fluids. The person may be given fluids to drink. The fluids contain both water and minerals. The doctor also may give the person fluids through a tube that is inserted into a blood vessel. Sometimes the person is given a medicine called an antibiotic.

Cholera often occurs in countries that do not have good sanitation equipment.

The best prevention for cholera is making sure that the water supply is clean. Sometimes people are given a vaccine to protect them from the disease.

Cholesterol

Cholesterol is a waxy material that forms in the human body. The body needs cholesterol in order to work. It helps form vitamin D and other products. But too much cholesterol can hurt the body.

Most cholesterol is made in the liver. Certain chemicals called proteins carry it through the bloodstream. Two such proteins are called low-density lipoproteins (LDLs) and high-density lipoproteins (HDLs).

LDLs bring cholesterol from the liver to other cells. After arriving where it is needed, the cholesterol leaves the LDL. The role of HDLs is not as clear. HDLs

When cholesterol builds up in blood vessels, it is difficult for blood to flow through the narrow openings in the vessels.

may bring unused cholesterol back to the liver to be broken down before it is removed from the body.

The liver makes most of the cholesterol the body needs. However, because cholesterol is in animal cells, when people eat animal products they are getting extra cholesterol. When extra cholesterol hardens, blood vessels become narrower. It then becomes harder for the heart to pump blood through the vessels. This can cause such problems as heart attacks or strokes.

People can lower their cholesterol levels by exercising, maintaining a healthy weight, and eating healthy foods. Doctors may recommend that people with high cholesterol eat less red meat, egg yolks, cheese, butter, and liver. These are major sources of cholesterol. Because fruits and vegetables do not contain any cholesterol, doctors often advise people to eat more of these types of foods.

Did You Know?

Plants, and foods that come from plants, such as olive oil, canola oil, or corn oil, do not contain cholesterol.

When there is no cholesterol built up in blood vessels, blood can easily flow through the vessels' openings.

Christianity

Worshippers in a Roman Catholic church face the altar, which is heavily decorated. Roman Catholic churches often have more statues and other decorations than Protestant churches.

With some 2 billion followers, Christianity is the world’s most widespread religion. Christianity is based on the life, death, and teachings of Jesus of Nazareth. The religion has three main branches—Roman Catholicism, Eastern Orthodoxy, and Protestantism.

Beliefs

Central to Christianity is the belief that Jesus is the Christ, or chosen one, whom God sent to the world to save humans. Christians maintain that Jesus had to suffer, die, and be resurrected (raised from the dead) to make up for people’s sins. Christians view Jesus’ new life after death as hope that they too may be granted everlasting life.

Christians also believe in the Trinity. The Trinity (meaning the three) is the idea that three figures are united in one God: God the Father, God the Son (Jesus), and God the Holy Spirit. The Holy Spirit is thought of as a helper sent to guide and teach humans.

The sacred scripture of Christianity is the Bible. It has two books—the Old Testament (or Hebrew Bible) and the New Testament, which tells the story of Jesus.

Practices

At the core of Christian living is love for God above all things. Christianity also tells people to love one another and to be forgiving, humble, and kind.

Some Important Christian Holidays		
Holiday	Meaning	Date
Advent	period of preparation for Christmas	begins on the Sunday nearest to November 30
Christmas	celebration of Jesus’ birth	December 25
Epiphany	celebration of the visit by the Magi, or Wise Men, to the infant Jesus	January 6
Lent	period of preparation for Easter	begins 40 days, not including Sundays, before Easter
Easter	celebration of Jesus’ rise from the dead	first Sunday after the first full moon after the spring equinox (March 21)

Some Protestant Christian churches attract large numbers of people.

Many Christians regularly attend church services, with Sunday being the most common day of worship. Services usually involve singing, Bible readings, and a sermon, or a talk by a priest or minister. In many churches, services include a ceremony called Communion. In this ceremony, members eat bread and drink wine in memory of the final meal Jesus had with his followers.

History

Jesus and Followers

Christianity grew out of Judaism in the Middle East. In about AD 29 a Jew named Jesus began to preach in Galilee. He attracted many followers because of his healing powers and his religious teachings. But people in power feared that he might lead an uprising, and they put him to death. The Bible holds that Jesus rose from the dead three days after being put to death, spent 40 days on Earth, and then was taken up to heaven.

For many years, Jesus' followers continued to practice religion in the same way

as Jews, except they believed that Jesus was a savior sent from God. In the 1st century AD a missionary named Paul helped separate Christianity and Judaism into two distinct religions.

Spread of Christianity

To help spread Jesus' teachings, some early Christians wrote about him. Writings by four men—Matthew, Mark, Luke, and John—were chosen as the standard account of Jesus' life and teaching. These four narratives now form part of the New Testament.

In the early days of the church, the Roman Empire controlled most of the Mediterranean region. Life was difficult and dangerous for Christians living within the empire. They were treated harshly for their beliefs. In AD 312, however, the Roman emperor converted to Christianity. By the end of the 300s, Christianity was the empire's official religion. This power helped secure Christianity's place in the world.

Greek Orthodox Christian priests and worshippers gather for a service in Bethlehem. Bethlehem is the Middle Eastern city where Jesus was born.

Christianity in the Middle Ages

Christianity continued to gain strength during the Middle Ages, a period from about 500 to 1500. Its leaders became powerful and wealthy, and the church was the chief cultural institution in Europe.

But as Christianity expanded, it did not remain unified. In 1054 the Eastern church at Constantinople separated from the Western church in Rome because of differences in beliefs and practices. This split created the Eastern Orthodox churches and the Roman Catholic church.

Another major development was the Crusades. In the 11th century a Muslim Turkish empire conquered southwestern Asia, including many places associated with Jesus. Over the next two centuries, armies of European Christians fought Muslim forces in the Middle East, partly in an attempt to recapture the Holy Land.

Modern Period

In the 1500s a German priest named Martin Luther began to question certain practices and teachings of the Roman Catholic church. Luther's criticism helped bring about the religious revolution known as the Reformation. As a result, various reformers eventually founded the first Protestant churches.

As Christianity flourished in Europe, Christians came to believe that their religion should be taught to people in other lands. Beginning in the 1500s and

continuing into the 21st century, Christian missionaries brought their faith to parts of Africa, Asia, and North and South America. These efforts helped make Christianity the most widespread religion in the world.

Christmas

Girls carry candles and sing in front of a festive Christmas tree in Seoul, South Korea.

Marking the birth of Jesus, Christmas is a major religious holiday for Christians. For many people it is no longer only a religious festival. It has become a season of gift giving and celebration. The date of Christmas is December 25. But Christmas celebrations often take place over several days or weeks.

Did You Know?

In addition to teaching about their religion, missionaries often set up schools and medical clinics.

Several traditional customs are part of the Christmas holiday in the United States. Decorating a Christmas tree with strings of lights and ornaments is one beloved custom. Another common custom is gift giving. This is frequently associated with a figure named Santa Claus.

In many European countries families exchange gifts on Christmas Eve, December 24. Like Santa Claus, Father Christmas and Père Noël are said to deliver presents to children in the United Kingdom and France, respectively. In Spain and Italy children receive presents on the night of January 5.

As part of the religious holiday, many Christians attend church services on Christmas Eve or Christmas Day. The word Christmas comes from the Old English term *Cristes mæsse*, meaning “Christ’s mass.” That was the name of the Christian worship service held on December 25 to honor the birth of Jesus. Christians believe that Jesus was born in Bethlehem. The actual day and year of his birth are not certain.

Chromosome

Chromosomes are tiny, threadlike structures inside every cell of every organism, or living thing. Chromosomes carry information about the organism in units called genes. When living things reproduce, they pass their genes along to their offspring.

Chromosomes are inside the cells of every living thing. They are so small that they can only be seen through a powerful microscope.

General Features

In animals and plants, chromosomes are located inside the nucleus, or central structure, of each cell. A material called deoxyribonucleic acid (DNA) makes up most of each chromosome. Plant and animal chromosomes also contain a material called ribonucleic acid (RNA) and some proteins.

Some organisms, including bacteria, do not have a nucleus. Their chromosomes float freely within the cell. In these organisms, chromosomes are made up of only DNA.

Chromosome Numbers

Every living thing has a specific number of chromosomes in most of its cells. In most plants and animals, chromosomes come in pairs. Potato cells have 24 pairs, for a total of 48 chromosomes. Mosquito cells have three pairs, for a total of six chromosomes. Human cells have 23 pairs, for a total of 46 chromosomes.

Did You Know?

Damage to chromosomes can cause birth defects and such diseases as cancer.

Humans and most other animals have the same number of chromosomes in every type of cell except one—the sex cells. These are the egg cells produced by females and the sperm cells produced by males. The sex cells have only one half of each pair of chromosomes.

During reproduction, the father's sperm cell and the mother's egg cell combine to form a new cell. This cell is the beginning of an embryo, or developing baby. Each sex cell brings its half set of chromosomes to the embryo. In this way, the embryo gets a full set of chromosomes.

Chumash

The Chumash are Native Americans who originally lived along the coast of southern California. They were known for the high quality of their crafts.

Long ago, Chumash people painted pictures on cave walls.

Most Chumash lived in villages made up of dome-shaped homes big enough to house several families. Chumash who lived on the coast or on nearby islands fished in the Pacific Ocean. They also hunted seals and sea otters. Farther inland, the Chumash hunted large game animals. Both groups relied on acorns as a source of food. They ground up the acorns to make flour.

Chumash women made baskets that were woven so tightly they held water. Chumash men made objects of stone and whalebone. They also crafted canoes from wooden planks.

The Chumash first met European explorers in 1542. Their first lasting contact with outsiders came in the early 1770s, when Catholic priests began establishing missions in the area. Soon most of the Chumash lived and worked in the missions, sometimes against their will.

The Chumash were freed from the missions in 1834. By that time many had died from diseases caught from the Europeans. After 1849 the survivors struggled as American settlers and gold seekers invaded their lands. By the end of the 1800s only a few Chumash were left. The Santa Ynez Reservation was set aside for them in 1901. At the end of the 20th century there were about 3,000 Chumash. Most lived on the reservation or in nearby towns and cities.

Church

A church is a public place of worship, usually for people of the Christian religion. Some Christian denominations, or groups, also have buildings called cathedrals. A cathedral serves as the central, or main, church for a geographical area.

The layout and design of churches can vary greatly. Still, many churches share some common features.

Most churches include an altar, or a raised platform. The people who perform the religious services are called the clergy. They stand at the altar during the services.

All churches have a seating area for the congregation, or people attending services in the church. Usually people sit in long wooden benches called pews. Some churches have separate seating areas for the choir, or people who sing at church.

Many churches have a tall bell tower.

Many churches have a bell tower containing one or more bells. The bells ring before and after services, to celebrate religious holidays, and sometimes to mark the time of day. Many churches also have stained glass windows. These colorful windows often show stories from the Bible.

Protestant churches tend to be more simple in their design than Roman Catholic churches and cathedrals. Protestant churches usually have fewer religious statues and other decorations as well.

Did You Know?

Many Christian churches have been built in the shape of a cross.

Churchill, Winston

Winston Churchill was the government leader who led the United Kingdom (Great Britain) to victory during World War II. He was one of the greatest public speakers of his time. He was also a bold soldier and a gifted writer.

Early Life

Winston Leonard Spencer Churchill was born on November 30, 1874, in Oxfordshire, England. His father was a wealthy politician. His mother was from the United States. Winston went to private schools and then to Sandhurst, the British military academy.

In 1895 Churchill entered the British Army. In 1899 he joined the Conservatives, a British political party. He was

Winston Churchill

elected to Parliament (the British legislature) in 1900.

Cabinet Member

In 1908 Churchill joined the top rank of government leaders, called the Cabinet. In 1911 he took control of the British Navy. He made sure that the navy was ready for war. During World War I (1914–18), however, he planned some attacks that failed. For a time he went back into the army. After the war Churchill held several important government jobs.

Wartime Leader

In 1939 World War II began. The British knew that they needed a strong leader. Churchill became prime minister (head of government) in May 1940.

Soon after Churchill took office, the Germans bombed Britain. Churchill stayed strong through the attacks. He

made speeches that gave hope to the British people. In 1945 Britain and its allies—the United States, France, and the Soviet Union—won the war.

Later Life

Churchill lost his position as prime minister after the war. In 1951 he became prime minister again. In 1953 he received the Nobel prize for literature. The prize honored his speech making as well as his writing.

Churchill retired as prime minister in 1955. But he stayed in Parliament and continued to write. In 1963 the United States made him its first honorary citizen. Churchill died in London, Britain's capital, on January 24, 1965.

Cinco de Mayo

Cinco de Mayo (5th of May) is a national holiday in Mexico. On that date in 1862 Mexican troops defeated

Many Cinco de Mayo celebrations include traditional Mexican dancing.

Did You Know?

When Churchill became prime minister, he said, "I have nothing to offer but blood, toil, tears, and sweat."

invading French forces in a battle at Puebla, Mexico.

The Mexican people remember the event by listening to political speeches and watching parades. Reenactments of the battle are often part of the celebration as well. In the United States, Cinco de Mayo is observed by people of Mexican descent. The holiday is a festive celebration of the heritage of Mexican Americans. In many cities there are parades and events featuring Mexican culture and music, dancing, and food.

In the mid-1800s the French leader Emperor Napoleon III tried to take control of Mexico. The victorious battle celebrated on Cinco de Mayo was an important blow against the French. During the battle of Puebla a small army of Mexican soldiers defeated a much stronger French army.

Circulatory System

All animals need to move important fluids through their body. The fluids move through what is called a circulatory system. The fluids carry nutrients and gases, like oxygen, that keep the animals alive. The fluids also remove wastes from the body. In humans and some other animals they also carry substances that help the body fight infection.

The circulatory system of humans consists of two parts: the cardiovascular

system and the lymphatic system. The main fluid in humans and most other animals is blood. It is transported through the cardiovascular system. This system consists of the heart and a network of blood vessels. The fluid that helps fight infections is called lymph. It is carried in the lymphatic system.

Circus

Circus clowns need to have many kinds of performing skills.

A circus is a form of entertainment that features many different spectacular acts. These acts usually include skilled and daring performers, highly trained animals, and funny clowns.

Circus acts often perform in a circle, or ring, with the audience on all sides. Big

circuses may have three rings with different acts inside each one. At one time, circuses put up a tent, known as the big top, to enclose the rings. Many circuses now use indoor arenas.

Circus Acts

Most circuses have many animal acts. Trick riders perform acrobatics on horseback or ride two horses at once. Elephants rise up on their hind legs or stand on their head. Other wild animal acts include dancing bears and tigers that jump through fiery hoops.

Human performers also amaze the audience. Some people walk a tightrope, swing from a hanging bar called a trapeze, or get shot out of a cannon. Clowns make the audience laugh with dancing, juggling, and comedy. They paint their faces white and wear goofy costumes.

The ringmaster—a dashing figure in high boots and a top hat—announces acts and sets the pace. A brass band adds to the excitement.

Circus History

In ancient Rome the circus was an arena for races and fights. A performer named Philip Astley created the modern circus in England in 1768. He built a performance ring where he did tricks on horseback for paying customers. He soon added clowns, acrobats, and other acts. As he toured, he spread the circus idea throughout Europe.

Circuses also spread to the United States. Circus performers and animals

Trapeze artists were popular circus performers during the 1800s.

often traveled from town to town in wagons or trains. They paraded through a town's streets before the first show there. In the 1880s two U.S. circus owners, P.T. Barnum and James A. Bailey, combined their shows to create a huge circus. They called it "The Greatest Show on Earth." The Ringling brothers bought that circus in the early 1900s. They joined it with their own circus to form the Ringling Bros. and Barnum & Bailey Circus. The main tent could seat 10,000 people.

Many circuses closed in the mid-1900s. After 1956, the Ringling Bros. and Barnum & Bailey Circus stopped using tents and moved indoors. Nevertheless, families today can still enjoy that circus and others. One of the biggest modern circus events is the circus festival of Monte-Carlo, in Monaco. Another

Citizenship

Citizenship is everything that has to do with being a citizen, or full member, of a country. Citizens have rights that are given by the country's government. For example, citizens have the right to be protected by a country's laws. In return, citizens have duties that they owe to the country. One of the most important duties is being loyal to the country.

Citizenship is different than nationality. A person's nationality tells which country that person (called a national) is from. But nationals from a certain country are not always citizens of that country. They may have gained citizenship in another country. Or they may have lost their citizenship. People who live in a country but are not citizens or nationals of that country are called aliens.

Becoming a Citizen

Every country has its own rules about who is a citizen and how to become one. Many countries have set up four basic ways to become a citizen. First, anyone who is born in the country is a citizen of that country. Second, anyone whose mother or father is a citizen of the country is also a citizen. Third, anyone who is married to a citizen becomes a citizen. Fourth, a person who goes through a process called naturalization becomes a citizen.

Naturalization is a way for people who are born in one country to become citizens of another country. Laws on naturalization are different from country to country. Usually, aliens who want to be naturalized must have lived in the new country for several years. They usually must speak the country's language. They may have to pass a test about the laws and history of the country. They often must take an oath, or swear to be loyal to the country. However, not every country allows aliens to become naturalized citizens.

Rights and Responsibilities

Citizens have certain rights. Some countries give their citizens more or different rights than other countries. Citizens usually have the right to vote. They usually have the right to be elected to government jobs as well. Other rights of citizens may include the right to follow any religion and the right to speak freely.

Citizens also have duties, or responsibilities. Voting is a responsibility as well as a right. Citizens must vote to make sure

Did You Know?

The idea of citizenship first arose in ancient Greece. A citizen in a Greek city-state was able to vote. He also had to pay taxes and serve in the military.

People from more than 40 countries are made U.S. citizens during a ceremony on Ellis Island, near New York City.

that their government works for the good of its citizens. Citizens also may have the duty to serve on a jury during a trial in court. Some countries make serving in the military a duty of all citizens.

Aliens may have some of the same rights as citizens. But they usually cannot vote or serve in the government. Aliens also have some of the same responsibilities as citizens. They must obey the country's laws. They often must pay taxes as well.

Losing Citizenship

People cannot lose their citizenship except in very special cases. A government may take away the citizenship of someone who becomes a naturalized citizen of another country. A government also may take away the citizenship of people who show allegiance, or loyalty, to another country. Examples of this include voting in a foreign election and serving in a foreign military. Trying to overthrow the government by force is a serious crime that can result in loss of citizenship. Naturalized citizens who commit serious crimes may lose their citizenship as well.

People who have lost their citizenship can end up as citizens of no country. These people are called stateless persons.

Citrus Fruit

Oranges, grapefruit, lemons, limes, shaddocks, and citrons are all types of

Citrus fruits include oranges, grapefruit, lemons, and limes. They are healthy because they contain a lot of vitamin C.

citrus fruit. Citrus fruits have a juicy pulp inside a leathery skin. They grow on trees, bushes, or shrubs. Citrus plants belong to the rue family of flowering plants. This family also includes the tiny orange fruits called kumquats.

Where Citrus Fruits Grow

Citrus fruits grow in warm regions in many parts of the world. They grew first in southern China and other parts of Asia. Arab traders brought citrus fruits to the Middle East, Africa, and Europe. European explorers brought citrus fruits to the Americas by the 1500s.

Farmers often grow citrus trees in areas called groves. Citrus plants may also grow in the wild or in people's gardens.

Physical Features

Citrus fruits have leathery peels, or rinds. Inside the rind, the flesh, or pulp, is divided into eight or more sections. Each section contains many tiny, juicy

pouches and seeds. However, farmers have learned how to grow seedless varieties of many types of citrus fruit.

Oranges and grapefruit are round. Oranges are usually orange in color. Grapefruit are yellow and often larger than oranges. Orange trees and grapefruit trees often reach 20 feet (6 meters) in height. Both types of tree have white flowers and shiny, green leaves.

Lemons and limes are more oval in shape. They often have a bump on one end. Lemons are yellow and larger than limes, which are green. Lemon trees and lime trees are generally smaller than orange or grapefruit trees. Lemon trees have purple and white flowers and reddish or green leaves. Lime trees have white flowers and pale green leaves.

Shaddocks are also called pummelos. They are big, yellow fruits with a round or pearlike shape. Their pulp is pale or red. Shaddock trees grow to a height of 20 to 43 feet (6 to 13 meters). They have shiny, green leaves and large, white flowers.

Citrons look like large lemons. They have whitish pulp. The rind has a thin outside layer and a thick inside layer. Citron trees grow to about 11.5 feet (3.5 meters) tall. They have pale green leaves and purple or white flowers.

Uses

Citrus fruits are a healthy food because they are rich in vitamin C. Many people eat citrus fruits raw or squeeze them to make juice. People also use citrus fruits

to flavor drinks and cooked dishes. In addition, citrus fruits may be canned or made into jam.

Citrus rinds provide oil that may be used as a flavoring or in making perfume and medicines. Rinds may also be cooked with sugar to make candy.

City

A city is a place where many people live closely together. City life has many benefits. Cities bring together a great variety of people from different backgrounds. They offer more jobs, more schools, and more kinds of activities than smaller towns and villages. But cities also can be dangerous and polluted.

About half the world's people live in cities. Tokyo, Japan, has more people than any other metropolitan area. (A city's metropolitan area includes the city itself and other places close by.) New York City is the largest city in the United States.

City Features

A city's central business district, or downtown, usually has its tallest office buildings and biggest stores. The downtown area is often the oldest part of the city. A city usually has one or more areas of factories and warehouses (storage buildings) outside of downtown. Most of the city's homes lie still farther from downtown.

Did You Know?

More than 100 million tons of citrus fruits are produced every year. Oranges make up more than half of the total.

Tokyo and its surrounding areas have more people than any other city in the world.

Cities usually have a variety of places for entertainment and relaxation. These include museums, concert halls, theaters, parks, and sports arenas.

Cities commonly have a public transportation system to help people get around without cars. Public transportation includes buses, trains, and subways. Subways are trains that run underground.

Built-up areas called suburbs lie outside the boundaries of most cities. Suburbs tend to have more houses and apartments than businesses. Many people live in the suburbs and commute, or travel, to their jobs in the city.

City Government

Like countries and states, cities have a government. A city government usually includes a group of elected lawmakers called the city council. Most cities also elect a leader called a mayor. In other

cities the city council names a leader called a city manager.

City governments provide many services. These include police protection, firefighting, hospitals, and schools.

Suburbs usually have more houses than businesses. People who live in the suburbs often work in a nearby city.

Many cities also support museums and libraries.

City Problems

Cities attract people looking for work, education, and other ways to improve their lives. But city life can also be hard. Not everyone shares equally in the benefits of the city. Some people live in run-down, overcrowded housing. Others have no homes at all. They sometimes live on city streets. Crowded living conditions in cities also lead to crime, traffic, and pollution.

History

About 5,500 years ago people in Mesopotamia (now Iraq) started the first cities. Rome (now in Italy) may have been the largest ancient city. Between 250,000 and 1.6 million people lived there.

Some cities in ancient times and in the Middle Ages (AD 500–1500) were independent of any country. They were called city-states. City-states ruled themselves and the surrounding area. Athens and Sparta were major city-states of ancient Greece. From the 1000s to the 1400s Florence, Venice, and other city-states were important in what is now Italy. After the Middle Ages these cities lost their independence. Today almost all cities belong to a particular country.

The Industrial Revolution, which started in the late 1700s, contributed to the growth of cities. New machines invented during this period made manufacturing an important business. Many people from the countryside moved into

Ruins of an ancient city called Harappa stand in present-day Pakistan. Harappa was one city of the Indus Valley civilization, which lasted from about 2500 BC to about 1700 BC.

cities. They looked for work in newly built factories.

In the late 1800s architects invented new building methods that changed the way cities looked. Tall buildings called skyscrapers appeared in many cities.

During the 1900s cities continued to change. They grew rapidly in population. They also spread outward. Many people moved to the suburbs. Some highly populated areas became known as megalopolises. Megalopolises often include several cities and many suburbs.

City-State

Venice and Genoa, now both in Italy, were important city-states during the Middle Ages. Sailors used charts called portolans to find these cities and others on the Mediterranean Sea.

Almost every modern city is part of a country. In ancient times and in the Middle Ages, however, there were cities that were independent. They are known as city-states. Each city-state governed only itself and the surrounding countryside.

City-states date back to the earliest years of Western civilization. Between 5000 BC and 2500 BC about a dozen city-states arose in Mesopotamia (modern-day Iraq). After 2300 BC, however, these city-states lost their independence and were forced to become part of the Akkadian Empire.

City-states developed again in ancient Greece, where mountains separated communities from each other. The

Greek city-states tried many kinds of government. Athens is considered to be the birthplace of democracy. Sparta was a military stronghold ruled by kings. Without lasting alliances, however, the Greek city-states were too weak to resist invaders. The Macedonians and later the Romans conquered Greece, and most city-states fell into ruin. Athens survives today as a modern city.

City-states emerged again in Europe during the Middle Ages. Venice, Florence, Genoa, Amalfi, and other city-states dominated the culture of what is now Italy from the 1000s to the 1400s. City-states also developed in what are now northern Germany and Belgium. They prospered from trade until they lost their independence to larger kingdoms.

One modern country that is considered a city-state is Singapore, which broke off from Malaysia in 1965. Its unique geography—a large island containing one major city—allowed it to develop as a self-governing city-state.

Civilization

A civilization is a large group of people who share certain advanced ways of living and working. Civilizations came about as humans started living in cities. City people developed advanced forms of culture and government. Eventually,

A carving shows Hammurabi (left), a king of Babylon. Babylon was a part of the ancient civilization that developed in Mesopotamia, in what is now Iraq.

this advanced lifestyle spread to people in large regions around cities.

How Civilizations Developed

The first civilizations developed in regions where farmers grew enough food to feed themselves and others. The people who did not farm began to live in larger villages, which grew into cities. These people practiced arts and crafts that they could trade for food. They developed writing systems to keep track of trade. They started transportation networks to carry goods between farm and city. City people also created governments and laws. They developed advanced religious practices as well.

Early Civilizations

The earliest civilizations developed in river valleys because the land there was

good for farming. The world's first civilization formed in Mesopotamia. This land was between the Tigris and Euphrates rivers in what is now Iraq. People first started settling there in about 4500 BC. The world's second civilization developed along the Nile River in about 2925 BC. It is now known as ancient Egypt.

By about 2500 BC another ancient civilization had formed in the valley of the Indus River. This was located around what is now the border between India and Pakistan. Ancient Chinese civilization developed by about the 1700s BC around the Huang He, or Yellow River.

Later Civilizations

Since these beginnings many great civilizations have risen and fallen. The ancient Greeks and Romans built civilizations in Europe. The Maya, Aztec, and Inca formed civilizations in the Americas. African peoples developed civilizations centered around such cities as Aksum and Great Zimbabwe. Arabs created an Islamic civilization in the Middle East and North Africa.

Today most people in the world belong to a civilization. European and American civilization is often called Western civilization. African, Asian (or Eastern), and other civilizations are sometimes known as non-Western civilizations.

Did You Know?

The word civilization comes from the Latin word *civis*, which means "city dweller." Latin was the language of ancient Rome.

Civil Rights

All people have certain rights. These are often divided into human rights and civil rights. Human rights include the right to live as a free person, the right to have shelter and food, and the right not to be mistreated. These rights belong to all humans just because they are human. Civil rights are rights that are granted to citizens by a government. For example, governments may decide who can vote, who can buy property, or who can be educated.

The Development of Civil Rights

The idea that governments should give people certain rights is a modern one. Before the 1700s groups of people sometimes fought for better treatment from a king or a ruler. In these cases, however, they wanted rights only for their own group. For instance, the Magna Carta was a document that granted rights to noblemen in England. The king signed it in 1215. But most people still had no way to complain if the king mistreated them.

In the 1700s some people began to talk about the idea that all people had certain rights. They thought that it was wrong for kings to ignore these rights. This idea led some people to fight two major revolutions against their kings—the American Revolution and the French Revolution. Afterward, the Americans and the French set up new forms of government run by the people. These governments granted certain civil rights to the people. In the United

A man votes in South Africa. Voting became a civil right for both black and white South Africans in the 1990s.

States, the Bill of Rights of the U.S. Constitution listed many of these rights. France used a similar list, the Declaration of the Rights of Man and of the Citizen, as a part of its first constitution.

The Fight for Equal Rights

However, even these new governments did not give equal rights to all citizens. Women did not have the right to vote in the United States until the 1920s. French women could not vote until 1945. African Americans were enslaved in parts of the United States until the mid-1860s. Even after they gained freedom, the government did not always protect their rights. They fought to gain the same civil rights as whites for many years. The civil rights movement that began in the 1950s was a part of this struggle. Today people in some countries are still fighting to gain the same civil rights that other citizens have.

Civil Rights Movement

The rights of a country's citizens are called civil rights. Many African Americans were denied full civil rights for about 100 years after the end of slavery. The struggle for those rights, especially in the 1950s and 1960s, is known as the civil rights movement.

Before the Civil War most blacks in the United States were slaves, who had no civil rights. After the war ended in 1865, blacks made some progress. Between 1865 and 1870 the 13th, 14th, and 15th amendments to the U.S. Constitution ended slavery and gave citizenship and voting rights to former slaves.

These rights were often ignored, however, especially in the South. To keep

poor African Americans from voting, some states made people pay a tax or pass a difficult test before they could vote. Violent groups such as the Ku Klux Klan tried to scare blacks away from the polls. Southern governments passed laws to keep African Americans separate, or segregated, from whites. In many places, for example, black children were not allowed to attend the same schools as white children.

Some African Americans resisted this unfair treatment all along. But not until the 20th century did blacks organize themselves into a movement. The most important leader in the early years of the civil rights movement was W.E.B. Du Bois. In 1909 he and others formed the National Association for the Advancement of Colored People (NAACP). The NAACP used the courts to fight for civil rights for blacks.

Events of the 1950s

The civil rights movement won its first major victory in 1954, in the court case of *Brown vs. Board of Education of Topeka, Kansas*. NAACP lawyers led by Thurgood Marshall argued the case before the U.S. Supreme Court. The Court ruled that separate schools for whites and blacks were unequal and therefore violated the Constitution.

On December 1, 1955, in Montgomery, Alabama, a black woman named Rosa Parks was arrested for refusing to give up her seat on a bus to a white person. Blacks protested her arrest by boycotting (refusing to use) the bus system. Late in 1956 the Supreme Court ruled that seg-

Did You Know?

The U.S. Supreme Court ruled that racial segregation was legal in 1896. The Court reversed this decision in 1954.

In 1958 a group of African American children take part in a protest against a restaurant in Oklahoma. The restaurant had refused to serve African Americans.

regation on public transportation was unconstitutional. One of the leaders of the boycott was a young minister named Martin Luther King, Jr. In the late 1950s King organized the Southern Christian Leadership Conference, a group dedicated to peaceful civil rights activities.

Many white people resisted change, especially in the South. In 1957 whites rioted at a high school in Little Rock, Arkansas, when the first black students enrolled there. U.S. President Dwight D. Eisenhower sent soldiers to restore order.

In 1960 the civil rights movement began using a form of protest called the sit-in. Protesters sat down in a place where they knew they would not be served, such as a segregated lunch counter, and refused to leave. Though the protesters were

often harassed or arrested, they remained peaceful, which created sympathy for their cause. A group called the Student Nonviolent Coordinating Committee organized many sit-ins.

In 1961 a group called the Congress of Racial Equality began sponsoring Freedom Rides through the South. African Americans and whites traveled together to make sure buses and stations were integrated. Some Freedom Riders were beaten or arrested. In Alabama a bus was bombed.

In August 1963 about 250,000 people gathered in Washington, D.C., to urge Congress to pass a civil rights law. The people sang “We Shall Overcome,” and King delivered a powerful speech known for the phrase “I Have a Dream.” The event was called the March on Washington.

The civil rights movement won major victories with the passage of new laws in 1964 and 1965. The Civil Rights Act of 1964 was the most extensive civil rights law in U.S. history. It outlawed discrimi-

Crowds of people protested for civil rights at the March on Washington in 1963.

nation in public places, in hiring, and in government programs. It also ended registration requirements and other obstacles to voting. The Voting Rights Act of 1965 ended other voting restrictions and led to a great increase in the number of black voters.

Beyond the Civil Rights Movement

Some African Americans were not satisfied with the progress made by the civil rights movement. Frustration led to rioting in several cities between 1965 and 1967. Some blacks formed groups that were willing to use violence to win racial justice. Malcolm X was an early leader of this “black power” movement. In 1968 King was assassinated in Memphis, Tennessee. His murder ended the civil rights movement as a unified effort.

In the years that followed, however, many civil rights leaders continued to work for racial equality by running for political office. The number of black public officials grew dramatically. Black leaders sought to help African Americans by supporting affirmative-action programs. These programs tried to make up for past wrongs by assuring economic and educational opportunities for blacks, women, and other groups.

Classical Music

The term classical music has several meanings. Many countries call their own traditional or ancient music classical music. However, in Western parts of the world people use the term classical music to refer to art music.

Art music, or classical music, is different from popular and folk music. Classical music is more complex. It is usually written down in a form that classical musicians can read off the page. Classical musicians do not frequently improvise. To improvise means to make up music while playing it.

Instruments and Forms

People called composers write classical music. They write classical music for different types of instruments. The music may require stringed instruments, wind instruments, keyboard instru-

Did You Know?

Much of the classical music that is performed today was written hundreds of years ago.

ments, or percussion instruments, or a combination of any of these.

Composers usually decide how many instruments should play a musical work. A musical work may be written for only one instrument, a few instruments, or a large group of instruments. An orchestra is a large group of instruments.

History

Classical music developed in Europe over hundreds of years. Much of the earliest classical music was used in religious ceremonies. Later, nonreligious music became more popular. Musicians often performed classical music to entertain audiences in royal courts.

Classical musical grew and changed rapidly from the late 1500s to the mid-1700s. The modern orchestra was formed during this time. Also, musicians created new types of classical music, such as opera. One of the greatest composers of this time was Johann Sebastian Bach.

Music experts call the time from about 1750 to 1820 the classical age. In this period, musicians developed a number of musical forms. One of them was the symphony, a long musical composition for an orchestra. Another was the string quartet, a musical composition for two violins, a viola, and a cello. Some important composers from the classical age are Wolfgang Amadeus Mozart and Ludwig van Beethoven.

Beethoven's music influenced many classical composers of the 1800s. Much

classical music during this time was dramatic and emotional. Some of the most famous composers from this period are Peter Tchaikovsky and Johannes Brahms.

The 1900s were a time of great experimentation in classical music. Composers used new forms and even new instruments. For example, electronic instruments opened up new ways of expression for composers and musicians. Claude Debussy, Igor Stravinsky, and John Cage were important composers of the 1900s.

Clay

Clay is a natural material made up of tiny particles of rock. When clay is mixed with enough water, it feels like soft, gluey mud. Unlike plain mud, however, clay holds its shape. Clay can be pinched, rolled, cut, or built up in layers to form shapes of all kinds.

Wet clay makes a very useful building material because it hardens as it dries. Clay baked, or fired, in an oven becomes especially hard and may last a very long time. Archaeologists have found pots

Did You Know?

The ancient Greeks selected and arranged the tones, or sounds, on which Western classical music is based.

A worker makes pipes from clay in China.

and bowls made of clay that are thousands of years old.

Like many other minerals, clay is mined, or dug up, from the ground. Before clay can be used, it must be cleaned. Cleaning removes small pieces of rock and other debris, or unneeded materials. Sometimes workers add sand to the clay to make it stronger.

People use different types of clay to make many things, including dishes, flowerpots, tiles, sewer pipes, sinks, toilets, and bricks. Kaolin, or china clay, is the most valuable type of clay. It is important in the manufacture of fine china and porcelain. It is also used to make rubber, paint, and paper. A very fine coating of kaolin gives certain papers a smooth surface. Kaolin is usually white in color. Other types of clay may be tan, brown, red, or gray.

Craftspeople who make things from clay sometimes use a pottery wheel to shape the clay. A pottery wheel is a round, flat surface that rotates, or spins. Clay placed

on a pottery wheel can be shaped into such objects as vases, jars, and pots.

Cleary, Beverly

Beverly Cleary is a popular author of lively, funny children's books. Her stories are often based on her own adventures as a child in Portland, Oregon.

Early Life

Beverly Bunn was born in McMinnville, Oregon, on April 12, 1916. She moved to Portland with her family when she was 6. Beverly struggled with reading as a child. But with the help of her mother, she learned to read at the age of 8. She developed a great love for reading and often visited the local library.

Career

In 1940 Beverly married Clarence Cleary. She decided to become a full-time author after working as a librarian in the 1940s. Her books are about kids

Beverly Cleary

Did You Know?

Cleary used her own twins as the basis for the characters Mitch and Amy in her books.

and their adventures—subjects that she would have liked to read about as a child.

Cleary published her first book, *Henry Huggins*, in 1950. Since then she has published more than 35 books. Her best-known books include *The Mouse and the Motorcycle* (1965), *Ramona and Her Father* (1977), *Ramona Quimby, Age 8* (1981), *Dear Mr. Henshaw* (1983), *Beezus and Ramona* (1987), and *Muggie Maggie* (1990).

Cleary's books have been published in many different languages. Cleary has won the Newbery Medal three times. The Newbery is a yearly prize awarded to outstanding books for children.

Cleopatra

Cleopatra was a queen of ancient Egypt. She wanted to make her country more powerful. To do so, she got the help of two leaders of ancient Rome: Julius Caesar and Mark Antony. However, a third Roman leader, Augustus, defeated her.

Early Years

Cleopatra was born in 69 BC in the city of Alexandria in Egypt. Her family originally came from Macedonia in Europe,

Cleopatra was a queen of ancient Egypt. She remains a symbol of beauty and power today.

but it had ruled Egypt for more than 200 years. Cleopatra and her brother, Ptolemy XIII, became rulers together after their father died in 51 BC. However, her brother had followers who soon drove Cleopatra from power.

Help from Caesar

Cleopatra went for help to Julius Caesar, a powerful Roman ruler who was then in Egypt. In 47 BC Caesar defeated Ptolemy XIII's forces, and Ptolemy died. Cleopatra returned to the throne. Her youngest brother, Ptolemy XIV, became co-ruler.

Cleopatra soon followed Caesar to Rome. She stayed there until he was murdered in 44 BC. Ptolemy XIV died in the same year. Cleopatra probably had him poisoned.

Mark Antony

After Caesar's death, Mark Antony became one of the three leaders of Rome. Cleopatra knew he could help her to gain more power. She charmed Antony, and he fell in love with her. Antony eventually left his wife Octavia to live with Cleopatra. This angered Octavia's brother Octavian, who later became the emperor Augustus. He soon declared war against Antony and Cleopatra.

Augustus defeated Antony and Cleopatra in the battle of Actium in 31 BC. The couple fled to Alexandria. About 10 months later, Augustus captured Alexandria. Antony killed himself. Shortly afterward, in 30 BC, Cleopatra also died. According to legend, she let a poisonous snake bite her. After Cleopatra's death, Egypt became a province of the Roman Empire.

Cleveland, Grover

Elected in 1884 and again in 1892, Grover Cleveland was both the 22nd and the 24th president of the United States. Cleveland was the only president ever to be reelected after a defeat.

Early Life

Stephen Grover Cleveland was born in Caldwell, New Jersey, on March 18, 1837. He was the son of Richard Falley Cleveland, a Presbyterian minister, and Ann Neal. Grover grew up in New Jersey and later in New York State. After his father died in 1853, Cleveland supported his mother and sisters. In Buffalo, New York, Cleveland worked in a law firm. In 1859 he became a lawyer.

Political Career

Cleveland soon joined the Democratic Party. In 1863 he became the assistant district attorney for Erie County, New

TIMELINE

1892

Cleveland dies in Princeton, New Jersey.

June 24, 1908

Cleveland is elected governor of New York.

Cleveland loses the presidential election to Benjamin Harrison.

Cleveland retires.

1897

Grover Cleveland was the 22nd and 24th president of the United States.

York. From 1870 to 1873 he served as county sheriff. In 1881 he was elected mayor of Buffalo. He became known for attacking dishonesty in city government. A year later Cleveland was elected governor of New York.

In 1884 the Democrats nominated Cleveland for the presidency. With his reputation for honesty, Cleveland contrasted sharply with his Republican opponent, James G. Blaine, who was known for political scandals. Cleveland defeated Blaine in a close election.

First Term

President Cleveland fought corruption and wastefulness. He hired government employees based on their ability, not their political loyalties. He also rejected dishonest claims for pensions made by Civil War veterans. In 1887 he signed

the Interstate Commerce Act, which established an agency to oversee the railroad industry.

In 1886 Cleveland married Frances Folsom, who became a popular first lady. The couple had five children.

Cleveland ran for reelection in 1888. His Republican opponent was Benjamin Harrison. Cleveland received about 100,000 more popular votes than Harrison, but he lost in the electoral college.

Second Term

After practicing law for four years, Cleveland ran for president again in 1892. This time he soundly defeated Harrison.

Cleveland now faced serious economic and labor problems. As the United States sank into an economic depression, banks and businesses failed. Workers angered by wage cuts went on strike, or refused to work. In 1894 a strike in Chicago against the Pullman railroad car company turned violent. Cleveland sent in federal troops to end the strike. That decision lost him the support of many workers.

Cleveland generally stayed out of foreign affairs. He refused to make Hawaii a U.S. territory. He also refused to help a group of Cubans revolting against Spanish rule.

Retirement

In 1896 the Democrats nominated William Jennings Bryan for president instead

of Cleveland. The next year Cleveland retired to Princeton, New Jersey. He worked at Princeton University until he died on June 24, 1908.

Climate

The weather found in a certain place over a long period of time is known as the climate. An area's climate determines what kinds of plants can grow and what kinds of animals can survive there. People use information about climates to decide which crops to plant, to prepare for natural disasters, and even to choose the best season for traveling to vacation spots.

Studying Climates

The study of climates is called climatology. Scientists have many tools to help in this study. They set up weather stations on Earth to measure rainfall, temperature, and wind speed. They send weather balloons with special instruments up into the atmosphere. Weather satellites in space also report information to scientists on the ground.

Factors That Affect Climate

Many factors affect climate. These factors include the sun, oceans, winds, land types, clouds, and human activities.

A weather balloon is released at a weather station at the South Pole.

Sunlight affects climate by hitting Earth unevenly. Places near the equator receive lots of strong sunlight throughout the year. This gives them a hot climate year-round. Places far from the equator get less strong sunlight, and so they are cooler.

Oceans also affect climate. Land near an ocean usually has a milder climate than an inland area. The ocean warms the land in winter and cools it in summer. This happens because water cools and heats more slowly than land.

Winds affect climate by carrying warm or cool air to areas. Winds also bring different amounts of moisture.

The type of land in an area affects the climate, too. For example, mountain ranges can block cold air. Also, places that are at higher elevations are usually cooler than nearby places at lower elevations.

Clouds affect climate by blocking the amount of heat received from the sun

during the day. During the night, clouds keep heat from escaping into space.

Finally, human activities may affect climate. When people burn fuels such as oil and coal to run cars and heat homes, the fuels release certain gases into the air. These gases trap heat on Earth. Some scientists think that Earth is slowly getting warmer and that this may be because of the extra gases in the air. This idea is known as global warming.

Types of Climates

No two places on Earth have exactly the same climate. Nevertheless, many climates are similar to one another. Some of these general types of climates are tropical, subtropical, cyclonic, polar, and highland.

Tropical climates are warm all year and have no winter. They lie near the equator. Some tropical climates have a lot of rain. Others are dry.

A village in northern Tunisia has warm and sunny summers. Many people take vacations in places with pleasant climates.

Subtropical climates are found north and south of the tropical climates. They have a greater range of temperatures than tropical climates. They also may be humid or dry.

Cyclonic climates are found mostly north of the equator. In these climates, cold air from the north mixes with warm tropical air from the south. This mixing often causes rain and snow. Cyclonic climates usually have warmer summers and colder winters.

Polar climates are very cold. Snow and ice often covers the land. Some polar areas always have a layer of frost, called permafrost, below the soil.

Highland climates have a great range of temperature between day and night. They tend to be humid and cooler than the lower lands nearby.

Clinton, Bill

The 42nd president of the United States, Bill Clinton served two terms, from 1993 to 2001. A popular leader, Clinton oversaw a growing economy. However, he was also the second U.S. president to be impeached, or officially charged with a crime. (The first was Andrew Johnson in 1868.)

Early Life

William Jefferson Blythe III was born on August 19, 1946, in Hope, Arkansas. His father died in an automobile acci-

Bill Clinton was the 42nd president of the United States.

dent before Bill was born. His mother, Virginia Dell Blythe, later married Roger Clinton, and Bill took his stepfather’s name.

Clinton graduated from Georgetown University in Washington, D.C., in 1968. He then attended Oxford University in England. In 1973 he earned a law

degree from Yale University. In 1975 Clinton married Hillary Rodham, a fellow graduate of Yale Law School. They had one daughter.

Political Career

In 1974 Clinton ran for a seat in the U.S. House of Representatives but lost. Two years later he was elected attorney general of Arkansas. In 1978 he became governor. Clinton lost the election of 1980 but won again two years later. Voters reelected him three more times. As governor, Clinton reformed Arkansas’s educational and tax systems.

Presidency

Clinton became the Democratic candidate for president in 1992. He chose Senator Al Gore as his vice presidential running mate. Clinton defeated his Republican opponent, President George Bush. He took office in January 1993.

Clinton’s first term had many successes. He appointed women and minorities to

important posts. He oversaw a major trade agreement between the United States, Canada, and Mexico. He attended peace talks between Israel and the Palestinians in the Middle East. He also sent U.S. peacekeeping forces to Bosnia and Herzegovina after that country's civil war.

However, Clinton's plan for a health care system failed. He and his wife also became linked to a business scandal known as the Whitewater affair. Nevertheless, Clinton defeated Republican Bob Dole in the 1996 election. Many people were happy with Clinton because the economy was doing very well.

In 1998 the public learned that Clinton had had an improper relationship with a young worker at the White House. The U.S. House of Representatives voted to impeach the president, or charge him with crimes. The House charged the president with lying under oath and trying to stop the investigation of the affair. In 1999 the Senate found Clinton not guilty.

Despite his impeachment, Clinton remained popular. He spent his last year as president working for peace agreements in the Middle East and in Northern Ireland. Clinton's vice president, Gore, lost the 2000 election to the Republican candidate, George W. Bush.

Clock

A clock is a device used to tell time. Moving hands on the face of a clock point to the current hour, minute, and second. A clock can be big enough to be in a giant tower. A clock can also be small enough to fit on a person's wrist, where it is called a watch. Many clocks are made to be beautiful objects as well as useful devices.

How Clocks Work

There are three main types of clocks: mechanical, electrical, and atomic. All three have the same basic parts. They must have a source of power, a device to keep the parts moving at regular intervals, and a way to display the time.

Mechanical clocks get their power from moving weights or springs. These parts are attached to gears, or toothed wheels. The gears are attached to the hands of the clock. As the gears move they move

The Houses of Parliament (a group of government buildings in London) are famous for their large clock tower. Big Ben is the name of the bell inside the tower.

Did You Know?

Hillary Rodham Clinton was the first wife of a sitting president to be elected to public office.

the hands. Another device attached to the gears keeps them moving at a regular pace. Mechanical clocks must be wound up to work.

Electrical clocks get their power from electricity instead of weights or springs. The electricity can come from a battery or from an electrical socket in a wall. Some electrical clocks have hands, as mechanical clocks do. Others have a digital display, where the hours, minutes, and seconds are shown as numbers. Electrical clocks are the most common type of clock used today.

Atomic clocks measure time using the waves of energy given off by atoms—the tiny bits of matter that make up the universe. Atomic clocks normally have digital displays. Because atomic clocks are the most accurate type of clock, scientists use them in their work.

History

In ancient times people measured time by watching the position of the sun in the sky. As the sun passed over a column or other device it would create a shadow. The length of the shadow would change depending on where the sun was in the sky. The length of a column's shadow therefore showed the basic time of day.

Eventually people wanted to tell time more accurately. The first mechanical clock was invented in the mid-1300s. Clocks powered by coiled springs and swinging weights were introduced in the 1500s. Clocks powered by electricity appeared in the late 1800s and early

1900s. Atomic clocks were developed in the 1950s.

Clothing

Many animals have fur, feathers, or other natural coverings to protect them from the weather. Humans have almost no natural protection from the weather. Even so, they live in some of the hottest and coldest places on Earth. People also have modesty, or the desire to cover their body. In addition, each person has a personality, a culture, and a place in society to show to other people. For all these reasons, people wear clothing.

Clothing Materials

Early humans made clothing from the skins and fur of animals. When humans

Women wore long dresses and big hats in about 1900.

began to settle in villages and to grow crops, they started making cloth from natural fibers. Such fibers as silk and wool came from animals. Cotton and flax were common plant fibers.

Late in the 1800s a French chemist created the first artificial fabric. He made an artificial silk out of a plant fiber that had been turned into liquid form. This is now called rayon. In the 1930s scientists made an even more useful material from petroleum, or oil. It is called nylon. Rayon, nylon, and other materials made from chemicals may be stronger and less likely to wrinkle or shrink than natural cloth.

Clothing Styles

Clothing styles depend on the climate of a region. People in a tropical rain forest need little or no clothing. In the hot deserts of the Middle East and North Africa, people wear loose white robes for protection against the sun. In the Arctic, where it is very cold, the Inuit wear warm furs and waterproof sealskin. In many other regions the weather may be hot or cold, depending on the season. People in these regions must have both light and heavy clothing.

People also wear clothing to tell others about themselves. Uniforms show which people are soldiers and police officers. Women sometimes wear different colors and styles than men do. Young people may wear unusual clothes to rebel against their parents. Rich people wear expensive clothes made by famous designers. Religion and culture affect clothing styles as well. Despite these

Young people of the late 1980s and early 1990s wore flannel shirts and ripped jeans.

differences, international business, travel, movies, and television have helped to spread similar styles around the globe. Jeans, for example, are popular almost everywhere.

Cloud

On a sunny day a wispy cloud can be a beautiful sight, but at other times a cloud can be a sign of storms to come. A

Wispy cirrus clouds drift high in the sky.

Different types of clouds form at different heights.

cloud is made up of millions of tiny water droplets or ice crystals floating together in the air.

The air always contains water vapor—water in the form of gas—which is invisible. The amount of water vapor that air can hold depends on the air's temperature. The cooler the air, the less water it can hold. When air cools, some of the

water vapor condenses, or forms visible water droplets. The droplets form around tiny particles in the air, such as dust or sea salt. Near the ground, the condensed water vapor becomes fog. Up in the sky, it forms clouds.

Air cools as it rises, so clouds form when warm, moist air rises. Air is forced upward when it blows against a moun-

Did You Know?

In the summer, small cumulus clouds that appear in the morning often turn into dark cumulonimbus clouds during the day.

tain inside. Air is also forced to rise when the land gets very hot. Sometimes clouds form when a cold air mass meets a warm, moist air mass. The warm air rises up over the cold air, causing the warm air to cool and clouds to form. Once clouds have formed, they will remain until the air is warmed or rain falls.

Meteorologists (people who study weather) classify clouds mainly by their appearance. The three main types of clouds are cirrus, cumulus, and stratus. Cirrus clouds are high, thin clouds made up of ice crystals. Cumulus clouds are puffy clouds that are often piled up like a mountain. Stratus clouds are layered. Scientists combine these terms with others—including “nimbus,” meaning rain—to describe 10 different cloud types. For example, cumulonimbus clouds are huge piled-up clouds that produce thunderstorms.

Coal

The major source of fuel throughout the world is coal. Coal is a black or brown rock that, when burned, releases energy in the form of heat. One of coal’s main uses is the production of electricity.

How Coal Formed

The coal used today began forming about 300 million years ago. At that time swamps with giant ferns and other plants were common on Earth. When these plants died, they sank in the water. They did not completely decay, or break down. Instead they formed a substance called peat. Over time layers of rock and

other materials built up over the peat. Heat and pressure hardened the peat into coal.

Forms and Uses of Coal

Coal has several different forms. Anthracite is hard coal. It produces the greatest amount of heat and is used mainly for heating homes. Bituminous coal is soft. Power plants use it to produce electricity. Bituminous coal is also used in steel mills to make coke, another kind of fuel. Lignite, the softest coal, is used to produce gas and electricity.

Coal Mining

People get coal by mining. In one process, called strip mining, miners take coal from just below the surface. In deep mining, miners dig long tunnels to get to coal that is buried far underground.

Mining coal can be dangerous for the miners. Coal miners can be injured or

Huge piles of coal wait to be shipped from a port in Poland.

killed when mine roofs collapse. Gases trapped in coal sometimes cause fires or explosions. Many miners have health problems from breathing in coal dust over the years.

Disadvantages of Coal

Compared to other energy resources, coal is inexpensive and plentiful. However, coal has several disadvantages. Burning coal can create acid rain, a dangerous form of pollution. Burning coal also increases the temperature of Earth's atmosphere, which may be harmful to living things. Finally, because coal takes so long to form, it is known as a nonrenewable resource. Eventually, Earth's supply of coal will run out.

Cobra

Cobras are poisonous snakes that flatten their necks into the shape of a hood when they sense danger. There are several species, or types, of cobra. Not all of them are closely related.

Cobras live in the southern parts of Asia and Africa. Some types dwell in grasslands, forests, or deserts. Others live in trees or along the shores of lakes.

Cobras are usually a single color or spotted. They are medium to large in size. The king cobra of Asia is the world's longest poisonous snake. It can reach a length of about 18 feet (5.5 meters).

A black-necked cobra spreads its neck to create a hood.

When a cobra feels threatened, it raises up its head and extends the ribs in its neck. This stretches the skin to create the hood. Some types of cobra have markings on the hood.

Cobras hunt in the evening and at night. Their prey includes mammals, birds, snakes, lizards, frogs, and even fish. When cobras bite, their short front fangs deliver venom, or poison, into the prey. Some types of cobra can also spit a stream of venom at the eyes of intruders.

Some types of cobra lay eggs. Others give birth to live young. The king cobra builds a nest for its eggs. It also guards the eggs until they hatch.

Cochise

Cochise was a chief of the Chiricahua band of the Apache people. In the 1860s he led a fierce fight to hold onto Apache

Cochise

lands in what is now the southwestern United States.

Nothing is known for certain of Cochise's birth or early life. He was probably born in about 1810. Through the 1850s his people enjoyed good relations with the U.S. government. The peace was broken in 1861, when some Apache stole a white rancher's cattle and kidnapped the son of a ranch hand. A U.S. Army officer thought Cochise was responsible and put him in prison along with several other chiefs. Cochise escaped, but the rest of the prisoners were killed.

Cochise wanted revenge. Under his leadership the Apache drove U.S. troops and settlers from their land in what is now southern Arizona. In 1863 U.S. troops killed Mangas Coloradas, a powerful Apache leader and Cochise's

father-in-law. Cochise then became the main Apache chief. He led raids against U.S. soldiers and settlers from the Arizona mountains until surrendering in 1871. He escaped in 1872, but he soon returned to Arizona and settled on the newly created Chiricahua Reservation. He died there on June 8, 1874.

Cockroach

Cockroaches are insects that have lived on Earth for more than 320 million years. There are more than 3,500 different species, or types, of cockroach. Most live in forests in warm areas. However, some cockroaches live in warm, dark areas of houses, apartment and office buildings, airplanes, and ships. Cockroaches are among the most hated household pests.

Cockroaches have a flat, oval body that is black or brown. For insects, they are quite large. The common American

Cockroaches are considered pests because they eat people's food and carry diseases.

cockroach can grow to about 2 inches (5 centimeters) long. Like all insects, cockroaches have a hard shell called an exoskeleton. The exoskeleton protects their soft body parts. Cockroaches have long legs that allow them to run very fast. Many cockroaches also have wings.

Cockroaches have well-developed senses. They have long antennae and compound eyes (eyes with many parts), which help them to hunt in near darkness. A pair of small hairs on their backside, called cerci, can sense the slightest movement.

Cockroaches in the wild eat rotting plants and animals. In cities cockroaches hide in the daytime and come out at night to eat. They eat food scraps, paper, clothing, and dead insects. Sometimes the food they eat gives them a bad smell. Cockroaches also spread several human diseases.

Cod

The fish called cod are important sources of food. People eat cod flesh as well as the oil in their livers. Cod-liver oil is very rich in vitamins A and D and other things that people need to stay healthy.

Cod live in the cold waters of the northern Atlantic and Pacific oceans. Other cold waters, such as the North Sea in Europe, are also home to these fish.

Cod are gray-green fish with speckles. They also have a white line on their sides.

The bodies of Atlantic cod are dull gray or green with speckles. Atlantic cod may also be reddish in color. A white line curves from head to tail along each side. Although smaller than Atlantic cod, Pacific cod look very much like their Atlantic relatives.

One unusual physical feature of the cod is its barbel. The barbel is a thin tentacle that hangs from the cod's lower jaw. Scientists think this organ may be a tool for finding small crabs or other food hiding in the sand.

Fishers prefer to catch cod that are 2 to 4 feet (0.6 to 1.2 meters) long. Fish this size usually weigh 10 to 25 pounds (4.5 to 11.5 kilograms). Cod that escape being caught may grow to be 6 feet (1.8 meters) long and more than 200 pounds (90 kilograms) in weight.

A female cod may lay as many as 8 million eggs. Ocean currents carry the eggs over large areas.

Cody, William Frederick

William Frederick Cody

William Frederick Cody—better known as Buffalo Bill—was a folk hero of the American West. Novelists wrote about his adventures as an Army scout and buffalo hunter. He also produced a famous show about the Wild West.

Cody was born in Iowa on February 26, 1846. He grew up in Kansas. At age 14 he started working for the Pony Express, a service that delivered mail on horseback.

In the 1860s Cody served in the American Civil War and scouted for the U.S. Army. As a scout he roamed around to gather information about the Native Americans. He also hunted buffalo (bison). He got the nickname Buffalo Bill for shooting thousands of buffalo to feed railroad workers.

From 1872 to 1883 Cody acted in plays about the West. He also guided the U.S. cavalry in 1874 and fought for the Army against the Sioux in 1876.

In 1883 Cody started his Wild West show—later known as Buffalo Bill's Wild West and Congress of Rough Riders of the World. The show featured trick riding, sharpshooting, and a buffalo hunt. It toured the United States and Europe for 30 years.

Cody used the money he made from his show to buy land in Wyoming. There he helped found the town of Cody. He died in Denver, Colorado, on January 10, 1917.

Coeur d'Alene

The Coeur d'Alene tribe of Native Americans traditionally lived in what is now northern Idaho and eastern Washington. Their name was given to them by French traders, but they called themselves the Schitsu'umsh. The name means "the discovered people."

Most of the year they lived in villages in permanent cone-shaped houses covered with bark and woven mats. They fished for salmon, hunted game animals, and gathered wild plants for food.

In the 1700s the Coeur d'Alene obtained horses for the first time. The men began making trips to the western plains on horseback. There they hunted

Morris Antelope was a chief of the Coeur d'Alene people.

bison (buffalo) and traded with Plains Indian tribes.

The Coeur d'Alene did not want traders to enter their lands. However, they did trade furs for metal tools, guns, and other manufactured goods.

Like many other Native American tribes, the Coeur d'Alene suffered from diseases brought by European settlers. Smallpox killed many people in the first half of the 1800s.

In the mid-1800s the Coeur d'Alene tried to resist settlers who wanted to take over their territory. In 1858 a force of 1,000 Coeur d'Alene, Spokane, and Palouse warriors fought a brief and unsuccessful war against United States troops. Following this defeat, the U.S. government moved the Coeur d'Alene

to a reservation in what is now Idaho. At the end of the 20th century about 1,500 Coeur d'Alene lived in the United States.

Cold, Common

The cold is one of the most common illnesses to affect humans. In fact, children may get 6 to 10 colds a year. People often catch colds during cold weather, but chilly temperatures are not the cause. Viruses, or tiny germs that enter the body, cause colds. More than 200 different viruses can cause a cold.

The symptoms, or signs, of a cold generally start two or three days after a cold virus enters the body. Symptoms may include a runny or stuffy nose, sneezing, coughing, sore throat, and headache.

More than 200 different viruses can cause the common cold.

The symptoms last from a few days to two weeks.

Cold viruses spread easily from person to person. Coughing and sneezing force a cold virus into the air. People may then breathe in the virus. They may also pick up a virus by touching surfaces where viruses have landed. Then when they touch their noses, the virus enters the body. Washing one's hands may help to prevent the spread of cold viruses.

There is no cure for the common cold. Treatment includes resting and drinking lots of water, juice, or soup broth. Steam from a hot shower or a vaporizer can make breathing easier. Saltwater nose drops can also help a stuffy nose. Cough drops can soothe a sore throat. Pain-relieving medicine can ease a headache.

Cold War

After World War II the United States and the Soviet Union were the superpowers of the world. They became rivals as they each sought to prevent the other from gaining too much power. The period of tension that existed between them came to be known as the Cold War. The conflict did not result in actual war between the two countries. However, it did lead to a number of smaller wars.

Background

During World War II, the Soviet Union freed many countries of eastern Europe from Nazi Germany. After the war, how-

In 1962 a U.S. ship (left) stops a Soviet ship carrying missiles out of Cuba.

ever, the Soviet Union continued to control the countries. It also forced its own Communist economic system on them.

The United States did not want Communism to spread to other countries in Europe. It also wanted the western European countries as allies, or friends. The United States therefore gave money to those countries to rebuild after the war. This was called the Marshall Plan. It was named for George Marshall, the American who proposed the plan.

Alliances

In 1949 the United States and its European allies formed the North Atlantic Treaty Organization (NATO) to protect each in case of attack. The Soviet Union and its allies formed their own alliance, the Warsaw Pact, in 1955.

Events of the Cold War

Two major crises of the Cold War involved the German city of Berlin. At the end of World War II the city, as well as the country, was divided into four zones. The United States, Britain,

Did You Know?

During the Cold War people in the United States built special shelters to protect themselves from nuclear war.

France, and the Soviet Union each controlled one of the sectors. In 1948 the three Western powers announced that they would combine their zones. The Soviet Union then cut off road and rail supply routes to the city, which was completely within the Soviet part of Germany. In response, the United States and Britain delivered supplies by airplane. This was the Berlin airlift. The Soviet Union lifted its blockade in May 1949.

In the years that followed, many people in East Berlin moved to West Berlin to escape control by the Soviet Union. In 1961 the Soviet Union tried to stop this movement by building a wall around West Berlin. The Berlin Wall became a symbol of the Cold War.

The Cold War soon extended beyond Europe. The Soviet Union gave support

to other countries throughout the world that had Communist governments. At the same time, the United States tried to prevent Communism from spreading any further. Both the Korean War in the 1950s and the Vietnam War in the 1960s and '70s were part of that struggle.

Other battles took place in the countries of the Western Hemisphere. In 1959 Fidel Castro established a Communist government in Cuba. In 1962, after spotting nuclear missiles on Cuba, the United States cut off supplies to the island. After several tense days of the Cuban Missile Crisis, the Soviet Union agreed to remove the weapons.

End of the Cold War

In the 1970s the United States and the Soviet Union signed agreements to limit the number of nuclear weapons that they each had. Other changes took place when Mikhail Gorbachev took power in the Soviet Union in 1985. He tried to reorganize the economic system and encouraged glasnost, or open discussion. In 1989 the Berlin Wall was torn down. The Warsaw Pact was dissolved in July 1991, and later that year the Soviet Union itself broke up into 15 separate nations. Communist rule ended in many countries, bringing an end to the Cold War.

Colombia

Colombia is the only country named after Christopher Columbus. He sailed near its Caribbean shores in the late 1400s. Colombia is located in northwestern South America. The capital is Bogotá.

Geography

Colombia shares borders with Venezuela, Brazil, Peru, Ecuador, and Panama. The Caribbean Sea lies to the north, and the Pacific Ocean is to the west.

Three ranges of the Andes Mountains cut through the western half of Colombia. In the east, tributaries of the Amazon and Orinoco rivers cross a vast plain. The country's most important river is the Magdalena, which flows north into the Caribbean. The climate is generally tropical, with warm temperatures year-round.

Plants and Animals

Colombia has areas of mangrove swamp, desert scrub, savanna grasslands, and tropical rain forest. Its animal life includes jaguars, tapirs, armadillos, ocelots, deer, monkeys, and rare spectacled bears. Colombia has more than 1,500 kinds of birds, ranging from the huge Andean condor to the tiny hummingbird. Turtles, piranhas, crocodiles, and electric eels live in the country's waters.

People

Nearly half of Colombians are mestizos, or people with mixed European and Native American roots. About one fifth of the people have mixed African and European roots. About the same number of people are white. There are smaller groups of blacks and Native Americans. Spanish and various Indian languages are spoken. Most of the people are Roman Catholics. More than three fourths of Colombians live in cities, mostly in the west.

Economy

Colombia's economy is based on banking and other services, agriculture, and manufacturing. Major crops include sugarcane, potatoes, rice, bananas, corn, and coffee. Some people illegally grow coca and marijuana plants, which are made into drugs. Colombia is also an important cattle-producing country. Factories make food products, beverages, textiles, chemicals, and machinery.

Many coffee plants grow on a plantation, or large farm, in Colombia. Coffee is one of Colombia's main crops.

Colombia is rich in natural resources, including oil, natural gas, coal, nickel, gold, and emeralds. Oil is the top export.

History

The first people to live in what is now Colombia were Native Americans. The most important group was the Chibcha. The Spanish explorers who followed Columbus began to conquer the area in 1525. The Spanish called the region the Kingdom of New Granada. They forced their language, religion, customs, and laws on the Indians.

Late in the 1700s the Spanish colonists in New Granada began to rebel against Spanish rule. In 1819 New Granada gained its independence. It became a republic known as Gran Colombia, which included what are now Colombia, Panama, Venezuela, and Ecuador. In 1830 Venezuela and Ecuador left the republic.

Colombia's political parties, the Conservatives and the Liberals, soon began fighting. The conflict reached its peak in the War of a Thousand Days, which lasted from 1899 to 1903. After the war Panama gained independence from Colombia.

Political violence broke out again in 1948. In nine years of civil war about 300,000 Colombians died. In 1957 the Conservatives and the Liberals agreed to share power. That agreement lasted until 1974. Since then Colombia has suffered from violence. Much of the violence has been caused by rebel political groups and illegal drug traders.

Colombo is one of the two capitals of Sri Lanka, an island country in the Indian Ocean. The offices of the president and prime minister of Sri Lanka are in Colombo. The country's supreme court and lawmakers meet in a nearby suburb named Sri Jayewardenepura Kotte.

Colombo is Sri Lanka's largest city. It is also the business center and leading port. Many people in the city work in government offices, banking, or insurance. Colombo's factories assemble cars and process foods, drinks, and tobacco.

Some of Colombo's buildings were built during the years of British rule. Others are modern towers.

In ancient times Colombo was a major port for the spice trade. In 1815 the British took control of the island. Colombo was their capital. Sri Lanka became an independent country in 1948. For many years Colombo was the country's only capital. In the late 1970s the government decided to transfer many departments to the nearby suburb.

Colony

A colony is a group of people from one country who build a settlement in another territory, or land. They claim the new land for the original country, and the original country keeps some control over the colony. The settlement itself is also called a colony. The practice of setting up colonies is called colonialism. A collection of many colonies is called an empire.

Before about 1950 a small number of countries controlled many colonies around the world. But the people in the colonies slowly gained independence as separate countries. Today few colonies are left.

Kinds of Colonies

Colonies are sometimes divided into two types: settlement colonies and colonies of occupation. People often formed settlement colonies in places where few other people lived. Ordinary people moved to a settlement colony to set up farms or run small businesses. The colonies that the English and other Europe-

A drawing shows the colony of Sydney, Australia, in 1788. The British set up the colony as a place to send prisoners.

ans established in North America beginning in the 1500s were settlement colonies.

Countries set up colonies of occupation by force. That is, a country conquered a territory, and then people from that country moved in to control it. Often only a few wealthy people settled in this kind of colony. India is an example of a colony of occupation. Great Britain controlled India from the 1800s until 1947.

Why People Set Up Colonies

One of the reasons countries formed colonies was to make money. Countries used colonies to control trade between their territory and the rest of the world. They also set up colonies to take advantage of natural resources in new lands. They took precious metals, timber, and furs from the territories and sold them to make money for themselves.

Another reason countries set up colonies was to increase their military power. They often set up bases for their armies and navies in their colonies.

Still other colonies were founded as prisons. Great Britain set up colonies in Australia as places to send its criminals.

Color

Without light, there is no color. When people see colors, they are really seeing different types of light bouncing off objects.

Color and Light

Light travels in waves. Scientists use an idea called wavelength to describe these waves. Some light waves have long wavelengths, while others have short wavelengths. Light of different wavelengths appears as different colors. For example,

Primary Colors of Light

Green (1), blue (2), and red (3) are the primary colors of light. A mixture of two primary colors of light can make cyan (4), yellow (5), or magenta (6). A mixture of all three makes white (7).

Primary Colors of Pigments

Yellow (1), cyan (2), and magenta (3) are the primary colors of pigments, or inks. A mixture of two primary colors of pigments can make green (4), red (5), or blue (6). A mixture of all three makes black (7).

red light has a long wavelength, and violet light has a short wavelength. Normally all the wavelengths, or colors, travel together as white light.

When white light passes through a special piece of glass called a prism, the light bends. Shorter wavelengths bend more than longer wavelengths. This bending causes the white light to separate into the colors of the rainbow.

White light also separates into different colors when it strikes objects. For example, when white light strikes a ripe tomato, mostly red wavelengths reflect, or bounce, off the tomato. The tomato absorbs, or takes in, all the other colors. This causes the tomato to look red.

Mixing Colors

Three colors of light—red, blue, and green—can combine to make any other color. For example, if a beam of green light shines over a beam of red light, yellow light appears. Red, blue, and

green are called primary colors of light. Mixtures of the primary colors of light produce all the other colors.

To make colors appear in printed books, people use inks. Inks, paints, dyes, and crayons get their color from pigments, or substances that reflect certain colors of light. The three primary colors of pigments are magenta (a purplish red), yellow, and cyan (a blue-green). Different mixtures of these colors can make all other colors. For example, mixing cyan ink and yellow ink makes green ink.

Seeing Color

Cells in the eyes called cones make it possible for humans to see color. Different types of cones absorb different colors. Some people are color blind. This does not necessarily mean that they cannot see any color at all. More commonly, people with color blindness think certain colors, such as red and green, look the same.

Colors can tell animals about their surroundings. Color attracts insects to flowers where they can get food. It can show when fruits are ripe and ready to eat. Color can also help certain plants and animals survive. For example, some animals have colors that are similar to the habitat in which they live. This helps them hide from other animals that may want to attack them.

Colorado

The state of Colorado got its name from the Spanish word meaning “red.” Spanish explorers gave the name to the Colorado River because of its brightly colored water, and later the name was used for the land as well. Colorado is nicknamed the Centennial State because it joined the Union in 1876—100 years after the signing of the Declaration of Independence. Denver is the state’s capital and largest city.

Geography

Colorado is in the western United States. It borders Nebraska on the north-east, Wyoming on the north, Utah on the west, New Mexico and Oklahoma on the south, and Kansas on the east.

The Rocky Mountains cover about half of Colorado, stretching from the north-west to the south-central part of the state. The highest peak is Mount Elbert at 14,433 feet (4,399 meters). Eastern Colorado is part of the Great Plains. Much of western Colorado is an area of flat-topped hills (mesas) and steep-walled canyons.

People

More than four fifths of Colorado’s residents are whites of European descent. Hispanics, mainly Mexicans, make up the largest minority. The numbers of African Americans and Native Americans are small. Members of the Ute tribe live on two reservations in the southwest.

Most of Colorado’s people live along the eastern edge of the mountains, an area of towns and cities that runs from Fort Collins in the north to Pueblo in the south. Denver, Boulder, Greeley, and Colorado Springs are major cities in this area.

Economy

Mining and agriculture have been major parts of Colorado’s economy since the frontier days. Today the state’s mineral wealth includes petroleum (oil), coal, molybdenum, sand, and gravel. The largest source of farm income is cattle raising, though many sheep and hogs also are raised. The main crops are wheat, hay, and corn.

Tourism, manufacturing, and high-technology industries became valuable in the 1900s. Major manufacturing industries include food processing and

The Cliff Palace in Mesa Verde National Park, Colorado, has about 200 rooms. The Anasazi people built the cliff dwellings about 800 years ago.

the production of computer and electronics equipment, metals, and military weapons.

History

Native Americans known as the Anasazi lived in the Colorado area from about AD 100 to 1300. Mesa Verde National Park in southwestern Colorado preserves ruins of their cliff dwellings. Spaniards first explored the area in the mid-1500s. Spanish and French explorers who visited in the 1700s met Plains Indian tribes such as the Cheyenne, the Arapaho, the Comanche, and the Kiowa.

In 1803 the United States bought the plains portion of Colorado as part of the Louisiana Purchase, a land deal with

France. The United States took control of much of the rest of Colorado after winning a war against Mexico in the mid-1800s. After gold was discovered in 1859, miners and other settlers arrived from the East. The U.S. Congress created the Colorado Territory in 1861. In 1876 Colorado became a state.

During World War II the U.S. government began building military bases and other facilities in Colorado. Many of the people who came to Colorado for work stayed after the war. Later, the creation of ski resorts helped make tourism a leading industry.

Colorado River

The Colorado River flows from Colorado southwest through the Rocky Mountains and into Mexico. There it drains into the Gulf of California, an arm of the Pacific Ocean. The river's most famous landmark is the Grand Canyon in Arizona. The mighty flow of the Colorado River carved out this huge canyon millions of years ago.

The Colorado River begins as a series of small streams in northern Colorado. For much of its length of 1,450 miles (2,330 kilometers), it is only a narrow passage through deserts. By the time it gets to the ocean, nearly all of its water has been used up.

People use much of this water. The river has several dams. It is connected to many canals. Along its course, a number of power plants use the water to create electricity. But the Colorado also loses more water through evaporation than it receives from rivers that flow into it.

The Colorado River cuts through Marble Canyon in Grand Canyon National Park.

Elk, bear, and moose are some of the many animals living along the Colorado River. Many different kinds of fish swim in its waters. The plants that grow near the river include cottonwood trees, columbine flowers, and prickly pear cacti.

Long before Europeans arrived in the area, Native American groups farmed along the Colorado River. Their farms were some of the earliest in North America. Spanish explorers discovered the lower Colorado River in the 1500s.

Many people today argue over how the Colorado River should be used. Several Western states and Mexico need its waters. This competition has led to legal battles. The ways in which people use the water have also created problems. One such problem is that the power plants and other human projects have polluted the water.

Columbia

Population
(2000 census),
city, 116,278;
(2007 estimate)
124,818

Columbia is the capital of the U.S. state of South Carolina. The city lies in the center of the state on the Congaree River.

Columbia is a center for supplying goods to surrounding areas. Factories in the city make cloth, steel, electrical equipment, and other products. Many people work for the government or in education. The University of South Carolina and several other universities are located there.

In 1786 the state government decided to move the capital from Charleston. Columbia was built to be the new capital. In the 1860s, during the American Civil War, many Confederate offices

Columbia, South Carolina, is a historic city with many old buildings.

were located in Columbia. In 1865 Union troops took over the city. A fire then almost destroyed Columbia. After the war the city was rebuilt.

South Carolina

Columbia River

The Columbia River is a major river that flows through Canada and the northwestern United States. The Columbia is about 1,240 miles (2,000 kilometers) long. It empties into the Pacific Ocean.

So many dams have been built along the Columbia that it has been called the Electric River. Dams produce hydroelectric power, or electricity that comes from intense water pressure. Together the Columbia River dams create almost one third of the hydroelectric power produced in the United States.

The Columbia River begins in Columbia Lake, in the Rocky Mountains in British Columbia, Canada. It passes

through the mountains and flows south into Washington State. In southern Washington the river turns west. It then flows to the Pacific while forming the border between Washington and Oregon. In this area it passes through the Cascade Mountains, where it forms the deep Columbia River Gorge.

Near the river's mouth heavy rains help evergreen forests grow. Farther inland the climate is drier. Pine, fir, and larch trees grow in the mountains where the river starts.

The Columbia was once filled with salmon. Now their numbers are greatly reduced. The dams have caused this change. But millions of water birds live in the surrounding wetlands. Deer, bears, and bighorn sheep are also common along the Columbia.

Native Americans have lived along the Columbia for centuries. European explorers first saw the river in 1775. The Lewis and Clark Expedition followed

part of the river in 1805 after the United States claimed the area.

Columbus

Population
(2000 census),
city, 711,470;
(2007 estimate)
747,755

Columbus is the capital of the U.S. state of Ohio. It is the largest city in the state. The Scioto River flows through the downtown area.

Many people in the city work for the government. Others work in banking, insurance, health care, research, or education. Ohio State University and several colleges are in Columbus. Factories in the city make cars and machinery.

Columbus was built in the early 1800s to be the new capital of Ohio. The state government offices were moved there from Chillicothe by 1816. The city grew as a transportation center.

In the years before the American Civil War Columbus was a place where escaped slaves could go to for safety and help. During the war captured Confederate soldiers were kept as prisoners in a camp in the city.

The Columbia River passes through the Cascade Mountains, where it forms the Columbia River Gorge.

The city of Columbus, Ohio, overlooks the Scioto River.

Many new factories were built in Columbus after 1940. The city began to grow greatly in the late 20th century.

Columbus, Christopher

Christopher Columbus opened the world of the Americas to his fellow Europeans. Europeans called Vikings had reached the Americas hundreds of years before Columbus first arrived there in 1492. However, the Vikings did not establish long-lasting settlements. Columbus explored the area and brought back more Europeans with him on later trips. Columbus' voyages therefore had many more lasting effects.

Columbus began an unstoppable wave of European settlement in the Americas. This settlement brought European culture to the Western Hemisphere. It also brought great hardship to the Native Americans there. They suffered from

diseases brought by the Europeans. They were also enslaved and forced to mine gold for the Europeans.

Early Life

Cristoforo Colombo was born in Genoa, Italy, in 1451. He is known as Christopher Columbus to English-speaking people. He was the son of a weaver and had little schooling.

In about 1476 Columbus settled in Portugal. In the 1480s he started planning a voyage to discover a sea route to Asia. Europeans were eager for Asian goods. However, these goods were costly because they had to be brought to Europe over a dangerous land route. Columbus knew that Earth was round. He thought that Asia must lie to the west, across the Atlantic Ocean.

The Portuguese king refused to pay for Columbus' voyage. Columbus then

Christopher Columbus

turned to King Ferdinand and Queen Isabella of the Spanish kingdoms of Aragon and Castile. In January 1492 they agreed to support the expedition. They provided three ships: the *Niña*, the *Pinta*, and the *Santa María*.

First Voyage

On August 3, 1492, the ships set sail. On October 12, Columbus reached the Bahamas, an island group east of Florida. He thought he had reached the East Indies in Asia. Columbus therefore called the islanders Indians.

Columbus reached Cuba on October 29. On December 6 he reached the island of Hispaniola. He built a fort on the island and left some men there. In January he returned to Spain. He took with him parrots, plants, gold, cloth, and several Native Americans.

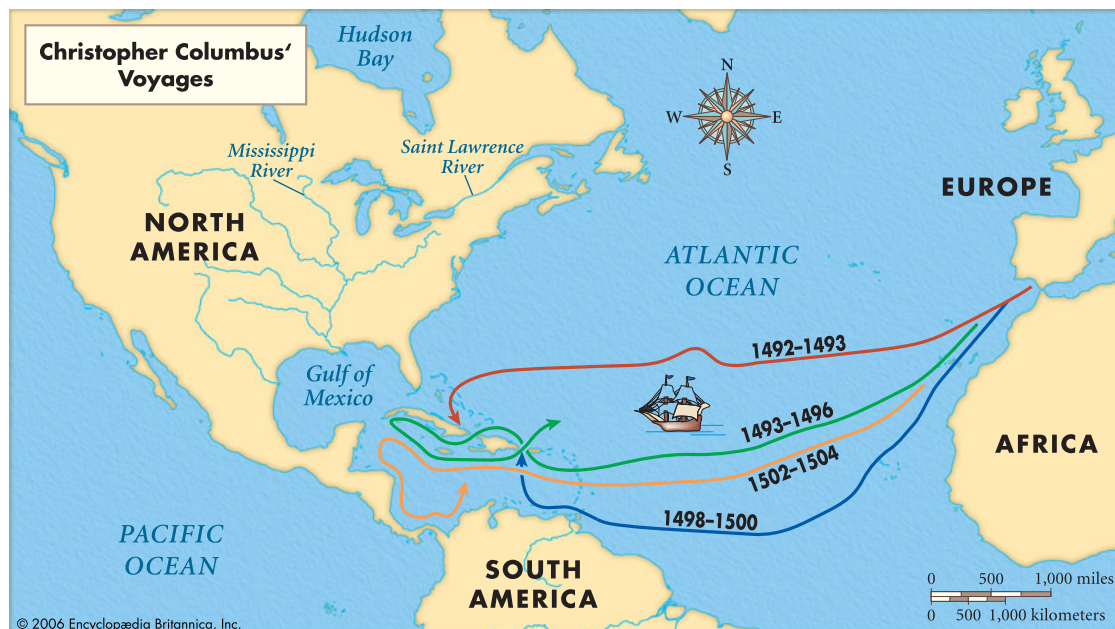

Later Voyages

Ferdinand and Isabella were pleased with Columbus and his discoveries. They

soon sent him back for a second trip. On his second voyage, from 1493 to 1496, Columbus had 17 ships and about 1,300 men. He found that the men he had left behind on Hispaniola had been killed. He then started a new colony and explored island coasts. He left his brothers in charge of the new colony when he returned to Spain.

On the third voyage, from 1498 to 1500, Columbus explored the Caribbean coast of South America. During this time, many people in the Hispaniola colony became angry with the rule of Columbus and his brothers. They complained to Spanish authorities. Columbus was eventually arrested and sent back to Spain in chains.

Upon his return, however, he was freed. He convinced Ferdinand and Isabella that he would find them treasures if he was allowed to return to the Americas. Columbus' last trip started in 1502. He explored the Central American coast but

lost all four of his ships. He had to be rescued.

Last Years

Columbus returned to Spain in November 1504. He died on May 20, 1506. Until his death he remained convinced that he had reached Asia.

Comanche

Quanah Parker was a Comanche chief of the late 1800s and early 1900s.

The Comanche people are a Native American tribe that once roamed the southern Great Plains of North America. They were one of the first tribes to use

horses extensively. Horses eventually changed the way that all Plains Indians lived.

The Comanche were originally a branch of the Shoshone people of Wyoming. The Comanche moved southward in stages, attacking and displacing other Plains tribes.

The Comanche got horses from the Spanish in the 1600s. They became skilled horse breeders. The Comanche used their horses to hunt bison (buffalo). Their main source of food was bison meat, and they used the animals' hides for clothing and as coverings for their tepees.

During their travels the Comanche introduced the use of horses to other tribes. By the early 1800s the Comanche had become a powerful tribe.

In the mid-1800s the southern branch of the Comanche were settled on a reservation in the Indian Territory (now Oklahoma). The northern branch of the tribe fought to protect its hunting grounds against white settlers. Many people were killed in violent battles between the Comanche and U.S. troops. The Comanche lost most of their land.

In the late 20th century about 10,000 Comanche lived in the United States. About 3,000 of them lived on private lands in the area of Lawton, Oklahoma.

Combustion

A bomb explodes in military training. During an explosion air expands and moves outward with great force.

Combustion is a chemical reaction that produces heat and light. The most common form of combustion is fire. Most forms of combustion happen when the gas oxygen joins with another substance. For example, when wood burns, oxygen in the air joins with carbon in wood.

Many common substances can undergo combustion—for example, paper, cloth, and natural gas. Combustion begins when the substance reaches a temperature called its ignition point. At this temperature oxygen combines with the substance fast enough to produce a flame. Different substances have different ignition points. For example, the ignition point of paper is about 451°F (233°C).

A substance may reach its ignition point by being heated, struck by a spark, or exposed to strong light. For example, a hot match can raise the temperature of a piece of paper to its ignition point. A spark can do the same thing. So can sunlight that is focused through a magnifying glass.

Very fast combustion can cause an explosion. This type of combustion happens in a bomb or a firecracker. During an explosion air heats up so fast that it expands and moves outward with great force.

Comet

A comet is a small chunk of dust and ice that orbits, or travels around, the sun. It is sometimes described as a “dirty snowball.” There are billions of comets in the solar system, but most never pass close by Earth. The best-known comet is

A shining comet streaks across the sky.

called Halley's Comet. It can be seen from Earth about every 76 years.

Orbit

Most planets orbit the sun in a path shaped like a circle. On the other hand, a comet's orbit is shaped like a long oval. Most comets travel very far into the outer solar system as they orbit. Depending on the comet, it can take from several years to many thousands of years to complete one orbit.

Earth passes through the orbit of some comets. Bits of dust left behind by the comets crash into the gases surrounding Earth. They burn up in the sky in what is called a meteor shower.

Parts of a Comet

The main part of a comet is called the nucleus. It is made of frozen water and gases plus dust and rock. The nucleus usually measures a few miles across.

Most of the time a comet consists of only its nucleus. However, when the comet gets close to the sun, the sun's heat causes it to shed gas and dust. A huge cloud of gas and dust called a coma builds up around the comet. The coma is sometimes larger than Earth. It makes the head of the comet look blurry.

When a comet moves even closer to the sun it grows tails. This happens because the sun gives off energy and streams of particles. They push some of the coma's dust and gases out into long streams. Comet tails can be very long—as long as the distance from Earth to the sun. The

coma and tails last only while the comet is fairly close to the sun.

Communication

People learn and share information through communication. All forms of communication have one thing in common: the sending and receiving of a message. Using different kinds of communication, people can pass along their ideas and feelings to just one person or to millions.

Communication is not only a human activity. Animals communicate through sounds, scents, and acts. Computers communicate with other computers through electronic networks.

People can quickly and easily communicate with one another over long distances using computers and cell phones.

Did You Know?

Halley's Comet passes by Earth every 76 years. It is named for Edmond Halley, an English astronomer who predicted one of its appearances.

Two songbirds—a female and a male—communicate with one another by singing. Birds can send a variety of messages, such as interest in mating, through their songs.

Kinds of Communication

People communicate through language, both spoken and written. Spoken language includes conversations and speeches. Written language includes books, newspapers, and e-mail.

People also communicate without words. Body and face movements show feelings. Deaf people use hand movements called sign language.

The arts are also a form of communication. Photographs, paintings, music, and movies can communicate feelings as well as facts.

History

The first modern humans appeared about 200,000 years ago. They likely used sounds, movements, and then speech. About 30,000 years ago humans started making paintings and sculptures on the walls of caves.

Humans invented writing more than 5,000 years ago. The ancient Sumerian people developed the first known script, called cuneiform. Then the ancient

Egyptians developed a picture-based writing called hieroglyphics. The invention of the printing press in the 1400s was a major advance in written communication. It let printers quickly make copies of a text.

Telecommunication is communication over long distances. In ancient times pigeons carried written messages. Before trains and cars, messengers on foot or on horseback carried letters. Public postal services started in the 1500s and 1600s. Since then, telecommunication has become faster thanks to television, telephones, and the Internet.

Communism

Communism is a type of government as well as an economic system (a way of creating and sharing wealth). In a Communist system, individual people do not own land, factories, or machinery. Instead, the government or the whole community owns these things. Everyone is supposed to share the wealth that they create.

Karl Marx

By the 1800s many countries followed the economic system called capitalism. Under capitalism, individual people, called capitalists, own property and run companies. Some capitalists became rich but paid their workers very little. In response, many workers began supporting the ideas of socialism. In a socialist

Karl Marx is often called the Father of Communism.

system, the government owns companies and divides wealth more fairly among the people. Karl Marx, a German thinker of the 1800s, took socialist ideas one step further. Marx's ideas became the basis of Communism.

Marx called the workers the proletariat. Marx thought that some day the workers would lead a revolution and overthrow the capitalists. After taking control, the proletariat would become the new ruling class. At first there would be a "dictatorship of the proletariat" to defeat all opposition. Then a true Communist society would develop. This would include common ownership of property and no government. People would work to produce wealth according to their abilities. Everyone would share in this wealth according to their needs.

Did You Know?

Karl Marx did not like religion. This prejudice made many religious people dislike Communism.

Communist Governments

The Russian Revolution of 1917 brought the first Communist government into power. Vladimir Lenin set up a political party to put Marx's ideas into practice. This party, later called the Communist Party, organized a new country named the Soviet Union.

After World War II ended in 1945, the Soviet Union forced many countries in eastern Europe to set up Communist governments. The United States and its allies opposed the spread of Communism. A rivalry called the Cold War developed between the two sides.

Communists took control of China in 1949. Communism then spread to other parts of Asia (Vietnam, Cambodia, North Korea), Africa (Ethiopia and Angola), and Central America (Cuba and Nicaragua).

None of these countries ever achieved a true Communist society like Marx had described. Instead of having no government, they all had very strong, strict governments. Plus, their government-run economies did poorly. Between 1989 and 1991 the Communist governments in the Soviet Union and eastern Europe collapsed. China's Communist government ruled into the 21st century. But China also took some steps toward a capitalist system.

Comoros

Three volcanic islands make up the Union of the Comoros, a tropical country off the east coast of Africa. The capital is Moroni, located on the island of Ngazidja.

Geography

Comoros includes the islands of Ngazidja (Grande Comore), Mwali (Mohéli), and Nzwani (Anjouan). The island of Mayotte, to the southeast, is a French territory. The islands lie in the Indian Ocean between Mozambique, a country in southeastern Africa, and Madagascar, a much larger island country. Volcanoes formed the islands, which are all mountainous. The climate is hot, with dry and humid seasons.

Plants and Animals

The islands contain lush tropical rain forests. Coconut palms and mangrove trees grow along the beaches. Among Comoros' animals are rare bats, birds, and lemurs. In the waters live coela-

canths, fish that scientists once thought were extinct.

People

Most Comorans have a mixture of African, Arab, Malay, and Indonesian roots. The majority of people are Muslims. The official languages are Comorian, Arabic, and French. Comorian is similar to Swahili, a language spoken in East Africa. About two thirds of the population lives in rural areas.

Economy

Comoros is a poor country. Agriculture and fishing are the most important parts of the economy. Crops include coconuts, bananas, cassava, rice, cloves, vanilla, and ylang-ylang (blossoms used in perfume). Trade and tourism are also important. Small manufacturers make perfume, cement, soaps, wood products, and clothing.

History

People have lived on the islands since about AD 500. Arab traders later settled there. The Comorans grew rich by selling slaves, sugar, and cloves. France took control of the islands in the 1800s. Comoros gained independence in 1975, but its government was not stable for many years. In 2001 a new constitution gave each island more power to govern its own people.

Compact Disc

A compact disc is a round, flat piece of plastic that is used to store and play back information. That information may include music, pictures, or computer programs and games. Compact discs are often called CDs. A digital videodisc, or DVD, looks like a CD but is more advanced. DVDs are often used to store movies.

How a CD Works

A CD is about 0.05 inch (1.2 millimeters) thick and 4.75 inches (12 centimeters) across. Inside the disc is a thin layer of metal. The information is stored on the metallic layer in the form of tiny pits, or holes, and the flat parts between them. The pits are arranged in a spiral, or winding path. The spiral starts in the center of the disc and winds around until it reaches the rim.

A laser beam reads information stored on CDs in a pattern made by tiny pits.

A CD is played by putting it into a CD player or a computer. The player or computer spins the CD. A laser, or strong beam of light, shines on the CD while it spins. The laser beam reflects off the metallic layer of the CD. The shape of the pits in the metal creates a pattern of reflected light. The CD player or computer reads this pattern of light and turns it into a form that a person can see or hear, or both.

History

Compact discs that stored sound were introduced in 1982. By the mid-1980s new discs called CD-ROMs could store pictures and computer programs. DVDs appeared in 1995.

Before CDs and DVDs were invented, music and movies were stored on vinyl records, movie film, or magnetic tape. CDs and DVDs are an improvement over those ways of storing information. The sound quality on a CD or DVD is better than on cassettes or records. CDs and DVDs also last longer and take up less space than film, magnetic tape, and vinyl.

Compass

A compass is a tool for finding direction. A simple compass is a magnetic needle mounted on a pivot, or short pin. The needle, which can spin freely, always points north. The pivot is attached to a compass card. The compass card is marked with the

People camping in the woods sometimes carry pocket compasses so they do not get lost.

directions. To use a compass, a person lines up the needle with the marking for north. Then the person can figure out all the other directions.

A compass works because Earth is a huge magnet. A magnet has two main centers of force, called poles—one at each end. Lines of magnetic force connect these poles. Bits of metal near a magnet always arrange themselves along these lines. A compass needle acts like these bits of metal. It points north because it lines up with Earth's lines of magnetic force.

Earth's magnetic poles are not the same as the geographic North and South poles. The geographic poles are located at the very top and bottom of a globe. The magnetic poles are nearby but not at exactly the same places. A compass points to the magnetic North Pole, not the geographic North Pole. Therefore, a

compass user has to make adjustments to find true north.

A special kind of compass called a gyrocompass does point to true north. The gyrocompass uses a device called a gyroscope, which always points in the same direction. Today large ships carry both magnetic compasses and gyrocompasses.

People in China and Europe first learned how to make magnetic compasses during the 1100s. They discovered that when a magnetized bit of iron floated in water, it pointed north. Sailors soon began to use compasses to navigate, or find their way, at sea.

Computer

A computer is a device for working with information. The information can be

Students use a computer in a classroom.

Small computers called laptops can be used for work or for playing games.

numbers, words, pictures, movies, or sounds. Computer information is also called data. Computers can process huge amounts of data very quickly. They also store and display data.

People use computers every day at work, at school, and at home. Computers are used in factories to control how things are made and in offices to keep records. People also use computers for sending e-mail, writing reports, shopping, banking, listening to music, and playing games. The Internet, which is a huge network of linked computers, provides information from all over the world.

Types of Computers

Computers come in many forms. Supercomputers are very powerful and expensive computers that are used for complex work, such as forecasting the weather. Desktop personal computers, or PCs, are used for tasks at the office, at school, and at home. Laptop and notebook computers do the same things as PCs, but they are smaller and easy to carry.

Personal digital assistants, or PDAs, are handheld computers. Some very small computers are used to control machines. They are built into such things as airplanes, robots in factories, cars, and even household appliances.

Computer Hardware and Software

A computer system requires both hardware and software. Hardware is the computer's physical parts. Software is the programs, or instructions, that tell the hardware what to do.

All computers have the same basic hardware. The microprocessor is the computer's "brain." It is also called the CPU, or central processing unit. The microprocessor handles all the information that goes into and comes out of the computer. The memory is hardware that holds programs and data while the microprocessor uses it.

Most personal computers have the same basic parts.

The programs and data are kept permanently on hardware called storage devices. Most computers have a storage device called a hard drive. The hard drive stores data on a metal disk inside the computer. Some storage devices put data on disks that can be easily moved from one computer to another. These disks include CDs and DVDs. They make it easy to share data.

Input and output devices are other types of hardware. Input devices let the user enter data or commands into the computer. Input devices include the keyboard and the mouse. Output devices let the user see or hear the results produced by the computer. Output devices include the monitor (or screen), printer, and speakers.

Communication, or network, devices connect computers to each other. They let people send data from one computer to another and connect to the Internet. Modems are communication devices that can send data through telephone wires or television cables. Some computers use wireless communication devices. They send data through the air using a small antenna.

Computer software is divided into two basic types—the operating system and application software. The operating system controls how the different parts of hardware work together. Application software gives the computer instructions for doing specific tasks, such as word processing or playing games.

How Computers Work

Most computers are electronic devices. This means that they work with electricity. All computer data is carried in tiny flows of electricity called electric currents. The microprocessor contains thousands or millions of tiny electronic parts called transistors. The transistors act as switches. They control how the electric currents flow.

Computers use these electric currents to represent the numbers 0 and 1. Computers use only these two numbers because transistors, like light switches, have only two states—they are either on or off. A transistor that is “on” represents one of the numbers. A transistor that is “off” represents the other. Computers use strings of 0s and 1s to stand for letters, sounds, and all of the other data they handle. For example, a computer stores the word dog as three numbers: 01100100 (d), 01101111 (o), and 01100111 (g).

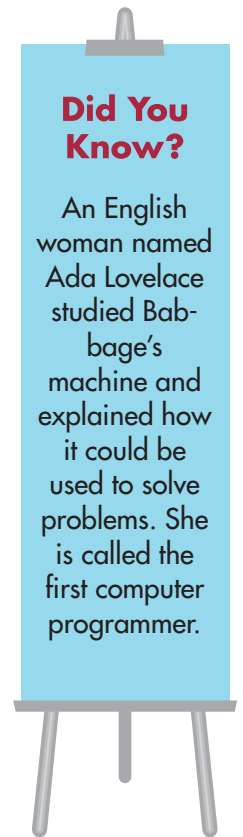

Computers can understand only these patterns of 0s and 1s. All of the instructions that a computer follows have to be in this form. But people find it hard to work with long number patterns. So the people who write computer software, called computer programmers, have their own special languages. These include programming languages called BASIC, Java, and C++. The computer turns programming languages into the number patterns that it can understand.

History

An English inventor named Charles Babbage designed the first computer in

Did You Know?

An English woman named Ada Lovelace studied Babbage's machine and explained how it could be used to solve problems. She is called the first computer programmer.

Did You Know?

The most powerful computers are called supercomputers. The fastest supercomputers of the 21st century can do trillions of calculations per second.

the 1830s. It was mechanical, not electronic, because scientists did not yet know how electricity worked. The design called for more than 50,000 moving parts. The machine was designed to follow instructions that people entered using punched cards. It was so complex that Babbage never got it built. But it is still considered to be the first computer.

The first electronic computers were invented in the 1940s. In place of mechanical parts, they used electronic switching devices called vacuum tubes. These computers were so big that just one of them filled a whole room. They cost millions of dollars.

Computers improved after the transistor was invented in 1947. The transistor was an electronic switching device that was much smaller and worked better than a vacuum tube. By 1960 transistors had mostly replaced vacuum tubes in computers. The new computers were smaller and more affordable than before.

The first computers with microprocessors appeared in the early 1970s. A microprocessor had many tiny transistors on one small wafer, or chip. It made personal computers possible. As more transistors were included in microprocessors, computers became faster and less expensive.

Conakry

Population
(2004 estimate)
1,851,800

Conakry is the capital of the West African country of Guinea. It is the country's only large city. Part of Conakry is on Tombo Island in the Atlantic Ocean. The rest of the city is on the mainland of Africa. A raised roadway connects the city's two parts.

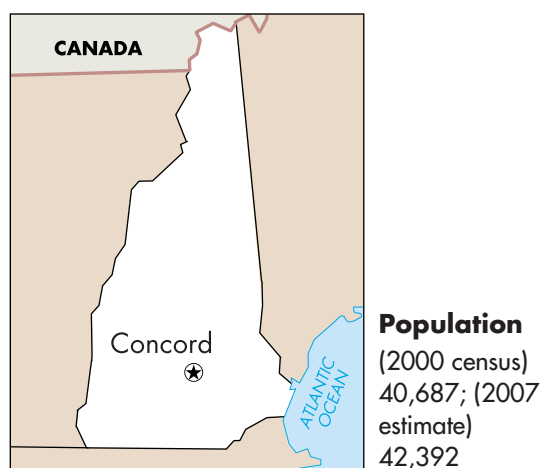

Shipping brings money to Conakry. The city is Guinea's main port. Government jobs and business services

are important to the economy. Conakry is also the country's center of industry.

A people known as the Susu lived in the Conakry area before Europeans arrived. French traders and soldiers took over Tombo Island in the 1880s. Their settlement later became the capital of the colony of French Guinea. In 1958 Guinea became an independent country with Conakry as its capital.

Concrete

Concrete is the world's most widely used building material. Concrete is an artificial, or man-made, stone. It is strong and long lasting. It can be made into almost any shape. Concrete is used to make driveways, patios, roads, bridges, and even entire buildings.

How Concrete Is Made

One of the main ingredients of concrete is a fine powder called cement. Concrete

A construction worker moves a slab of concrete. The metal bars in the concrete make it especially strong.

is made by mixing cement with sand, gravel, and water. The water and cement form a thick paste that holds the sand and gravel together. The water also causes a chemical reaction that makes the mixture dry and harden. Before concrete dries it can be poured into forms to make many different shapes, including blocks, bricks, flat slabs, and arches. After the concrete dries, it lasts a very long time.

Advantages of Concrete

Concrete does not burn and it stays strong during a fire. Materials can also be added to make the concrete stand up to heat, water, or chemicals. It can be made light or heavy in weight. Some types of concrete will even harden underwater.

Concrete with metal bars running through it is called reinforced concrete. It is even stronger than regular concrete and can support heavy loads. Reinforced concrete is used to make roads, bridges, and very tall buildings.

History

Concrete has been around for a long time. Thousands of years ago the ancient Babylonians used clay to hold sand and gravel together. Ancient Romans used ash from a volcano to make the concrete. The ash, when mixed with water, acted like glue, just like modern cement does. The Romans used concrete to build their domes, aqueducts, and bridges. In the 1800s cement was invented and became the main ingredient in concrete.

Confederate States of America

The Confederate States of America was formed after Abraham Lincoln was elected president of the United States in November 1860. Lincoln was against slavery. For many people in the Southern states slavery was a part of their way of life. They were afraid that the new government would end slavery and make them give up that way of life. Therefore a group of these states withdrew from the United States and formed their own government. To defend this government they fought the American Civil War from 1861 to 1865.

Member States

The first states to withdraw from the Union were Alabama, Florida, Georgia, Louisiana, Mississippi, and South Carolina. Representatives from these states organized the Confederate States, or Confederacy, on February 4, 1861. Texas joined a month later. After the first shots of the war were fired, Arkansas, North Carolina, Tennessee, and Virginia also joined. Part of Virginia later decided to split off and form the new state of West Virginia. That state joined the United States in 1863. Other slaveholding states stayed in the Union.

Organization

Jefferson Davis of Mississippi was elected president of the Confederacy,

and Richmond, Virginia, was made the permanent capital. The government ordered a flag to be created and issued postage stamps and money. The Confederate States had a constitution similar to the U.S. constitution. The government was also organized into branches and departments much like those of the United States.

The Civil War

After withdrawing from the Union, the Confederate States took possession of the forts and other public property of the United States lying within their borders. U.S. troops, however, continued to occupy Fort Sumter, located in the harbor off Charleston, South Carolina. On April 12, 1861, the Confederacy opened

A map shows how the issue of slavery divided the United States.

fire on the fort. On April 14 the Union troops surrendered. The next day President Lincoln called for troops to be used against the Confederate States. This was the beginning of the Civil War.

End of the Confederacy

The Confederacy had some advantages in the Civil War. It was defending its own territory, and it had brilliant generals. However, the Confederacy had only about 5.5 million citizens (and 3.5 million slaves). There were 22 million Northerners. The Confederacy also had few factories to produce the goods it needed to survive. After four years of fighting, Confederate forces surrendered on April 9, 1865.

Confucius

For more than 2,000 years the people of China have been guided by the principles of the teacher and philosopher Confucius. His teachings, known as Confucianism, are based on kindness, love, and respect. Confucianism serves as a way of life, a source of values, and a social code for its followers.

Confucius was born in 551 BC in Qufu, in what is now China's Shantung Province. His exact birthday is not known, though many people in eastern Asia celebrate it on September 28. Confucius is not his original name. His family name was Kong. Confucius is a European version of the Chinese name Kong-fuzi, meaning "Master Kong."

The Chinese teacher and philosopher Confucius is pictured in a painting from the 1700s.

Confucius was a good student in his youth. He studied many subjects, including ceremonial practices, music, archery, driving a chariot, calligraphy, and arithmetic. He also had a good understanding of history and poetry.

While in his 30s Confucius began teaching. His goal was to improve society. He believed that students should work on bettering their lives in addition to gaining knowledge.

Confucius was also concerned with politics. He wanted an influential position in the government so that he would be able to reform society. He held government posts while in his 40s and 50s, but he never received a position of great influence. Confucius died in 479 BC.

China

Congo, Democratic Republic of the

Located along the equator in Central Africa, the Democratic Republic of the Congo is the third largest country on the continent. Its capital and largest city is Kinshasa.

Geography

The Democratic Republic of the Congo shares borders with the Central African Republic, Sudan, Uganda, Rwanda, Burundi, Tanzania, Zambia, Angola, and the Republic of the Congo. The western tip of the country touches the Atlantic Ocean.

The Congo River flows through the country and along its western border. High plateaus border the plains around the river. Three chains of mountains run through the east. Margherita Peak, at 16,795 feet (5,119 meters), is the country's highest point. Most of the country is hot and humid.

Plants and Animals

Rain forests of mahogany, ebony, and other trees grow in the Congo river basin. Mangrove trees grow in swamps near the coast. Grasslands cover the eastern plateaus.

The country's many wild animals include chimpanzees, monkeys, elephants, lions, cheetahs, hyenas, buffalo, antelope, rhinoceroses, and giraffes. Gorillas live in the eastern mountains.

Hippopotamuses and crocodiles inhabit rivers and lakes.

People

The people of the Democratic Republic of the Congo belong to many different ethnic groups. The major groups are the Luba, the Kongo, and the Mongo. French and English are the official languages, but many people speak Lingala or one of 200 other languages. Most of the people practice Christianity. The rest follow traditional African beliefs or other religions. More than two thirds of the people live in small towns and villages.

Economy

Most of the people are farmers. Main crops include cassava, sugarcane, plantains, corn, oil palm, peanuts, and rice.

Elephants wade across a stream in the Democratic Republic of the Congo.

Mayi, Kolwezi,
Kisangani

The country also produces coffee, cotton, and rubber.

The next most important part of the economy is trade, which depends on the country's rich natural resources. The Democratic Republic of the Congo is a leading producer of diamonds. It also has deposits of petroleum, coal, copper, cobalt, zinc, and gold.

History

Before Europeans arrived in the late 1800s, several kingdoms ruled the region that is now the Democratic Republic of the Congo. They included the Kingdom of Kongo, the Luba Empire, and the Lunda Empire.

King Leopold II of Belgium claimed the region, which he called the Congo Free State, in 1885. The king forced the people to work in mines and on rubber

plantations. In 1908 the Belgian Parliament took over the land, which it renamed the Belgian Congo.

In June 1960 the colony gained independence as the Republic of the Congo. From the beginning, the president and the prime minister fought for power. In September 1960 the army's chief of staff, Joseph Mobutu, took control of the country. In 1971 Mobutu renamed the country the Republic of Zaire.

Mobutu ruled as a dictator who crushed all opposition. By the 1990s, political groups in Zaire demanded a democracy. Rebels forced Mobutu out of the country in 1997. Laurent Kabila took power and changed Zaire's name to the Democratic Republic of the Congo. However, rebels continued to fight the government, and Kabila was assassinated in 2001. His son and successor, Joseph Kabila, worked to end the civil war that had killed millions.

Congo, Republic of the

Antelope, jackals, hyenas, and cheetahs roam the savannas. Rhinoceroses and giraffes live on the plateaus.

People

About half of Congo's people are Bakongo, or Kongo, the ethnic group that gave Congo its name. Other major groups include the Sanga, the Teke, and the Mboshi. French is the official language, but most of the people speak African languages. Most people are Christians. About two thirds of the people live in cities.

Economy

The economy of Congo depends on its petroleum (oil) industry. Congo also produces natural gas, wood, and gold. Most people, however, are farmers. Crops include cassava, sugarcane, oil palm, bananas, and mangoes.

History

Before Portuguese explorers arrived in 1483, the Kingdom of Kongo ruled part of what is now Congo. In 1880 France took control of the region.

Congo gained independence in 1960. In 1992 Congo became a democracy, but fighting soon erupted between government forces and rebel groups. After the civil war, voters approved a new constitution in 2002.

Conifer

Conifers are a group of trees and shrubs that produce cones. The cones carry their seeds. Most conifers are evergreens, or trees that keep their leaves year-round. Their thin leaves are usually called needles. There are more than 550 types of conifer. Some of the most well-known are cedars, cypresses, firs, junipers, larches, pines, redwoods, and yews. The tallest, heaviest, and oldest living things on Earth are all conifers.

Where Conifers Grow

Conifers grow all over the world. Forests of conifers grow in many cool regions, including the northern parts of Europe, Asia, and North America. Some types of conifer grow in tropical rain forests in

Asia. Others grow in warm parts of Australia and Africa.

Physical Features

Conifers have woody trunks and stems. They may be low shrubs or very tall trees. Their leaves often look like needles, but some types have leaves shaped like scales, blades, or wedges. A waxy coating keeps the leaves from losing water. Most conifers have shallow roots that spread out wide.

Conifers grow cones instead of flowers or fruits. Most conifers' cones are oval in shape. Scales cover the outside of the cone. Some types of conifer grow male and female cones on the same tree. Others have male or female cones on separate trees. The male cones, which are smaller than female cones, produce pollen. Wind carries this pollen to the female cones. Then the female cones develop seeds under the scales. The scales slowly open until the seeds fall out. Wind or animals carry the seeds to spots where new conifers can grow.

Amazing Conifers

The redwood trees in California are the tallest conifers and the tallest trees in the world. Some redwoods are taller than 360 feet (110 meters). The giant sequoias, also in California, are the heaviest conifers. They sometimes weigh more than 4 million pounds (2 million kilograms). The pygmy pines of New Zealand are the smallest of all conifers. They grow to only 2 inches (5 centimeters) tall.

A large forest of conifers stands in the northern European country of Finland.

Conifers grow their seeds inside cones. They usually have needle-shaped leaves. Redwoods are the tallest conifers and the tallest trees on Earth.

Bristlecone pines are the oldest conifers, as well as the oldest living things on Earth. It is not unusual for them to live for 3,000 to 4,000 years. They grow in dry, mountainous regions in California and Nevada.

Uses

People have used the wood of conifers for thousands of years. Ancient peoples built great sailing ships out of cedars from the Middle East. More than 500 years ago, warriors in Europe made long bows from the bendable wood of yews.

Today people use the wood of pines to make houses and furniture.

People today also plant conifers in gardens, parks, and yards. They grow them indoors as decorative plants. People in North America and western Europe use pines, firs, spruces, and other conifers as Christmas trees. In addition, conifers are used to make such products as paper and turpentine.

Connecticut

The state of Connecticut was named for the Connecticut River. Algonquian Indians called the river *Quinnehtukqut*, meaning “land on the long tidal river.” Connecticut is nicknamed the Constitution State because its early settlers wrote a set of laws to govern themselves that later provided ideas for the U.S. Constitution. Those laws, known as the Fundamental Orders of Connecticut, were created in 1638 and covered such issues as elections, powers of officials, and taxation. The capital of Connecticut is Hartford.

Geography

Connecticut is the southernmost New England state. It is bordered by Massachusetts on the north, Rhode Island on the east, New York on the west, and the Long Island Sound on the south.

Connecticut has highlands in the west and east with a lowland in the middle. The northern part of the western high-

lands is called the Litchfield Hills. They include Mount Frissell, which is the state’s highest point at 2,380 feet (725 meters). The central lowland includes the fertile Connecticut River valley. The eastern highlands are low, wooded hills with many rivers.

People

At the time of the first U.S. census, in 1790, almost all of Connecticut’s people were English. In the 1800s Irish, French Canadian, Italian, Polish, and other European immigrants settled in the state. Today more than four fifths of Connecticut’s residents are of European heritage. African Americans and Hispanics each make up about 9 percent of the population. The state’s Asian American and Native American groups are small.

Connecticut has a large population for its size. As a result, it is one of the country’s most crowded states. Most of its people live in cities or towns. Bridgeport, on the coast, is the largest city. Other large cities are Hartford, New Haven, and Stamford.

Economy

Real estate, finance, and the insurance industry are major parts of Connecticut’s economy. Hartford is known as the Insurance Capital of the World because of the many insurance companies with offices there. Manufacturing businesses in Connecticut produce jet aircraft engines, computer equipment, chemicals, machinery, and other goods. Hart-

The writer Mark Twain lived in Hartford, Connecticut, for more than 15 years. The house that he lived and worked in is now open to the public.

ford, Bridgeport, Danbury, and New Haven are the state's leading manufacturing centers. New Haven is also the site of Yale University, one of the leading educational institutions in the United States.

History

The first residents of the Connecticut region were Algonquian Indians. Euro-

peans arrived from nearby colonies in the 1630s. In 1633 Dutch colonists built a fort and trading post where Hartford now stands. English colonists from Massachusetts established posts at what are now Wethersfield and Windsor. Later the English took over the Hartford site. In 1662 the English king made Connecticut an independent colony. In 1788 Connecticut entered the Union as one of the original 13 states.

Connecticut was a farming region until the early 1800s, when textile factories were established. By 1850 more people worked in manufacturing than in agriculture. In the 1900s Connecticut was called an "arsenal of democracy" because it produced many firearms used in World Wars I and II and the Korean and Vietnam wars. Manufacturing later declined in value, but high-technology industries boosted the economy.

Conquistador

The Spanish word for conqueror is conquistador. Many Spanish soldiers and explorers traveled to the Americas after Christopher Columbus made the first trip in 1492. These conquistadors sailed to the Americas to conquer the native peoples and to spread Christianity. They were also looking for gold and other treasure.

Because of the conquistadors, Spanish culture spread widely throughout South America, Central America, and the southern regions of North America. The Spanish influence is strong in these areas even today.

Many of the conquistadors' actions were cruel. They stole the riches that they found in the new lands. They brutally murdered thousands of native people. They also brought diseases such as smallpox that killed many more thousands.

One of the most famous conquistadors was Hernán Cortés. He destroyed the Aztec Empire in what is now southern and central Mexico. Cortés arrived in Mexico in 1519. He and his men defeated the Aztec in 1521.

Another Spanish conquistador, Francisco Pizarro, conquered the Inca Empire in what is now Peru. Pizarro came to Peru in 1531. He killed the leader of the Inca and captured their capital in 1533.

Conservation

Conservation is the protection of things found in nature. It requires the sensible use of all Earth's natural resources: water, soil, minerals, wildlife, and forests. People who care about conservation try to preserve natural resources so they

An illustration shows Spanish conquistadors supervising Native Americans, who are carrying supplies for them.

will still be around in the future. They also try to keep the environment clean and healthy.

Types of Resources

Some resources are renewable, which means they can be replaced. Living things, such as plants and animals, are examples of renewable resources because they can reproduce themselves. But renewable resources can still be damaged or destroyed. For example, people might catch too many of one type of fish. If not enough fish are left to reproduce, that type of fish might die out. Conservation helps people manage renewable resources so they are kept in good supply.

Other resources are nonrenewable, which means they cannot be replaced. Fossil fuels, such as coal and petroleum (oil), are examples of nonrenewable resources. Minerals, such as iron ore, also are nonrenewable resources. People can conserve nonrenewable resources by using them carefully. They can also look for other resources that serve the same

Some cities encourage people to carpool, or share car rides. Carpooling is a good way to conserve gasoline.

purpose. For example, people can use less petroleum by using other types of fuel instead.

Conservation Challenges

Conservation can be hard because it can require people to give up some conveniences. For example, cars make travel easy, but they also produce a lot of air pollution. To have cleaner air, people can choose to drive less and walk more. Such changes can be hard when people have gotten used to a certain way of living.

Money is another reason why conservation can be a challenge. For example, a timber company might be able to protect forest animals by limiting the number of trees it cuts. But the company might not be willing to do this because it will make less money. Also, factories might not want to spend the money to clean up the messes they make.

Conservation Solutions

Everyone can contribute to conservation in one way or another.

Workers take care of young tropical trees in Brazil. The trees were planted to replace trees that were cut down.

People can recycle paper, plastic, glass, and other materials. Recycling saves resources by reusing materials that would otherwise be thrown away. Industries can limit the amount of pollution they create. Governments can make laws that help to keep the air and water clean. Governments have also set aside land as national parks. These parks protect land and animals in their natural state.

Constellation

A constellation is a group of stars. The groups are identified according to patterns that people have seen in the stars. For example, the stars of the constellation Leo seem to trace the outline of a lion. The name Leo means “lion” in the Latin language. The constellation Draco, whose name is Latin for “dragon,” is said to look like a dragon. However, these are not scientific groupings. They are simply ways that people have imagined the stars.

Since ancient times people have tried to explain the night sky. Over thousands of years different cultures have seen different patterns in the stars. They have named many different constellations after familiar animals, everyday objects, and characters and beasts from stories.

Today constellations provide a connection between modern humans

The constellation Orion is associated with a character in Greek mythology who was a hunter. An illustration shows how the stars of the constellation might be seen as the image of a hunter.

and ancient stories. They are also interesting to spot in the night sky. Astronomers, or scientists who study stars, have named 88 constellations. They use the constellations to help describe the location of specific stars. Among them are the 12 well-known constellations that lie in a band of space called the zodiac. These are Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpius, Sagittarius, Capricornus, Aquarius, and Pisces.

A person looking at the sky from the same point every night will see different constellations at different times of year. This happens because Earth moves around the sun, while the stars do not. Earth completes one trip around the sun

Did You Know?

The sky above the Southern Hemisphere (half of the world) and the sky above the Northern Hemisphere have different sets of constellations.

each year, so different stars are visible from Earth in the course of a year.

Constitution

A constitution is a set of rules that guides how a country, state, or other political organization works. The constitution may tell what the branches of the government are, what powers they have, and how they work. It may also state the rights of citizens. The government's other laws are not allowed to disagree with its constitution. The constitution may be amended, or changed, but this is generally more difficult to do than passing an ordinary law.

Development of Constitutions

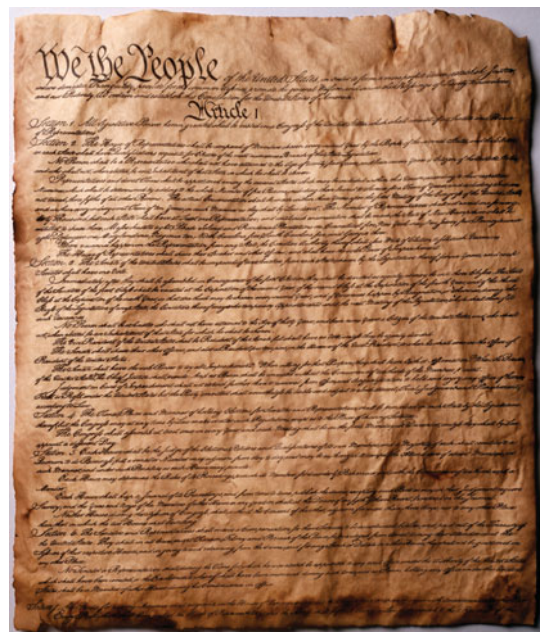

The first people to think about constitutions were the ancient Greeks. They established a form of democracy, in which some of the people had a say in how the government was run. For hundreds of years after this, however, most people were ruled by kings or queens. The people had no rights, and they had no say in how they were governed. Eventually that began to change. In 1215 the landowners in England were upset with their cruel and greedy ruler, King John. They banded together and forced the king to sign a document that guaranteed them certain rights. The document was called the Magna Carta. The Magna Carta served as a model for many future constitutions.

In the 1600s and 1700s thinkers like John Locke in England and Jean-Jacques Rousseau in France wrote about an idea called the social contract. This idea states that people give up their freedom to do anything they want in return for the protection of a stable government. These thinkers influenced the writing of the U.S. Constitution in 1787.

Modern Constitutions

The U.S. Constitution took effect in 1789. It is now the oldest written constitution. It has set a pattern for many other countries. Today almost all countries have written constitutions. Many have had several in their history.

One country without a written constitution is Saudi Arabia. It uses the Koran and other Islamic teachings as its highest law. The most famous example of a country without a written constitution

The original signed copy of the U.S. Constitution is one of the treasures of the National Archives in Washington, D.C.

is the United Kingdom. The British constitution is a group of laws that have built up throughout history. Its elements include the Magna Carta, the English Bill of Rights of 1689, laws passed by Parliament, court decisions, and other sources.

Not all constitutions come from the people of the country. For example, the United States set up the Japanese constitution of 1947 after it defeated Japan in World War II. And even the finest constitution does not guarantee that the government will follow it. Dictators, or rulers who take unlimited power, often ignore their country's constitution.

Amendment • Government • Magna Carta • United States Constitution

In order from largest to smallest, they are Asia, Africa, North America, South America, Antarctica, Europe, and Australia. Sometimes people think of Europe and Asia as a single continent called Eurasia.

The continents have different kinds of weather, landscapes, and populations. For instance, Antarctica is icy and has very little plant and animal life. Africa, though, tends to be very warm and has a great variety of plants and animals.

Most of the continents are also divided into political units called countries. Parts of Antarctica are claimed by several countries, but there are no permanent settlements on the continent. Australia is the only continent that is occupied by a single country.

Continent

On a globe, continents are the easiest things to spot. A continent is a large solid area of land. Earth has seven conti-

In 1912 a German scientist named Alfred Wegener came up with the idea that the continents were once all joined together. He called this large body of land Pangaea. He suggested that more

than 200 million years ago Pangaea split apart to form the continents. The continents then drifted apart to their current locations.

Scientists since then have found evidence that this idea is correct. They now believe that the continents sit on a number of large plates. The plates float on a layer of melted rock. As the plates slide over the melted rock, the continents also move. This idea is called plate tectonics.

Continental Congress

The Continental Congress was the first government of the United States. When the congress adopted the Declaration of Independence on July 4, 1776, it brought the United States into existence. It then served as the country's government until the U.S. Constitution went into effect in 1789.

First Continental Congress

In the early 1770s citizens of the 13 British colonies in North America were starting to rebel against Great Britain. A network of patriots, known as the Committees of Correspondence, called together the First Continental Congress to plan future action.

The First Continental Congress met in Philadelphia, Pennsylvania, on September 5, 1774.

The First Continental Congress met in secret in Philadelphia, Pennsylvania, on September 5, 1774. All colonies except Georgia sent delegates, or representatives. George Washington, Patrick Henry, John Adams, and Samuel Adams were among them. Each colony had one vote.

The delegates decided not to call for independence from Britain. Instead they demanded such rights as life, liberty, property, public assembly, and trial by jury. They protested having to pay British taxes without being represented in Parliament (the part of the British government that made laws). The congress also called for the colonies to boycott, or refuse to buy, British goods.

Second Continental Congress

The American Revolution had already begun when the Second Continental Congress opened in Philadelphia on May 10, 1775. Delegates from all 13

colonies attended the congress. New delegates included Benjamin Franklin and Thomas Jefferson. Among those serving as president were John Hancock and John Jay.

The congress took control of the colonies' new Continental Army. It put Washington in command of the army. The congress also issued and borrowed money and set up a postal service and a navy.

At first the congress still said that the colonists were fighting for their rights as British citizens. On July 2, 1776, however, the congress stated that the colonies should be independent states. The congress declared independence from Britain two days later.

The congress prepared the Articles of Confederation, which served as the first constitution of the new United States. The articles went into effect in 1781. They gave Congress official powers. After that, the Continental Congress became known as the Confederation Congress.

The Confederation Congress had little real control over the states. In 1789 the new U.S. Constitution set up the U.S. Congress. The U.S. Congress replaced the Confederation Congress.

Did You Know?

The Second Continental Congress did not have a permanent home. Its final seat was New York City.

took command of a ship at age 29. He took part in several battles in what is now Canada during the French and Indian War. After the war he charted the coast of Newfoundland. In 1766 he wrote a paper about an eclipse of the sun that won him fame as a scientific observer.

Three Voyages of Discovery

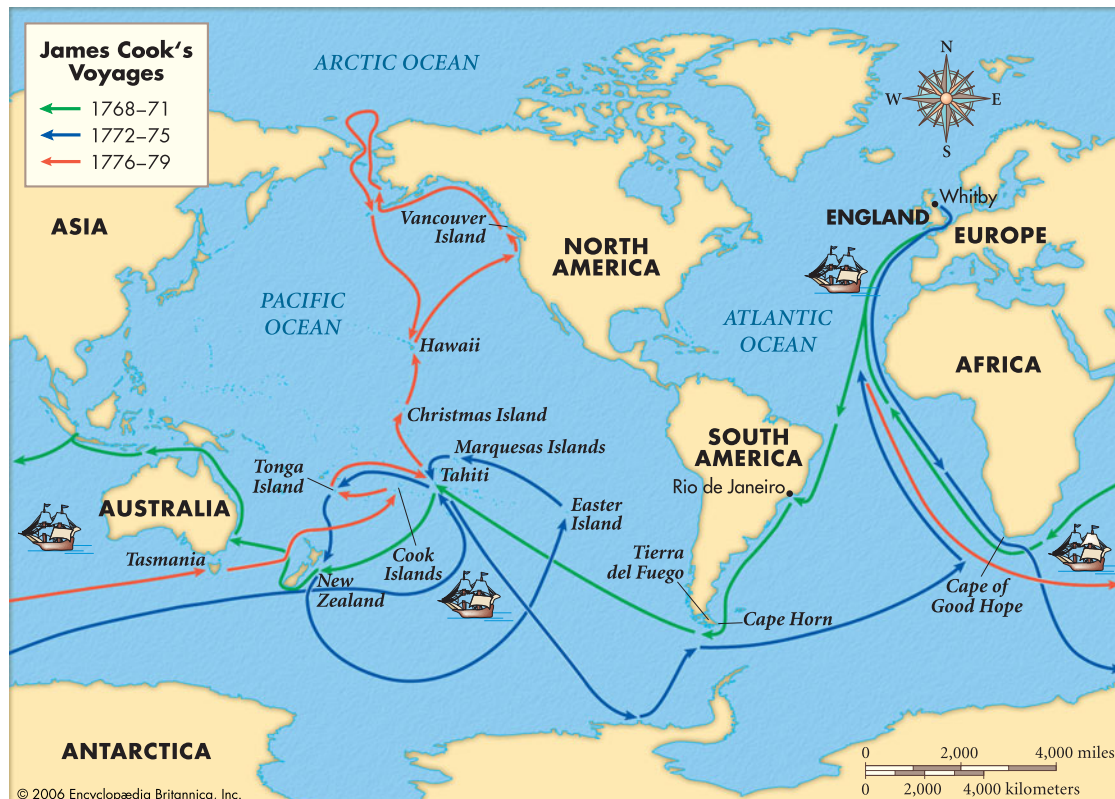

In 1768 the Royal Society of London, an organization of scientists, asked Cook to lead the first scientific expedition to the Pacific Ocean. Cook's expedition charted New Zealand. It also reached the southeastern coast of Australia in 1770. Cook named the continent New South Wales and claimed it for Great Britain. He returned to England the following year. In honor of his achievements, Cook was promoted to the rank of commander.

Between 1772 and 1775, Cook went around the world from west to east, seeking to discover another southern continent. Cook did not reach Antarctica, but he did become the first European to cross the Antarctic Circle. He also discovered and mapped many island groups.

In 1776 Cook set out in search of a Northwest Passage from the Pacific to the Atlantic across the top of North America. He did not succeed, but he did become the first European to visit the Hawaiian Islands. Revisiting the islands on his way back from the Arctic, Cook was killed by Hawaiians. He died on February 14, 1779.

Coolidge, Calvin

The 30th president of the United States, Calvin Coolidge took office after the death of President Warren G. Harding in 1923. A popular politician, he served during a period of economic growth.

Early Life

John Calvin Coolidge was born on July 4, 1872, in Plymouth, Vermont. He was the only son of a storekeeper, John Calvin Coolidge, Sr., and Victoria Moor Coolidge. Coolidge graduated from Amherst College in Massachusetts in 1895. Two years later he became a lawyer. In 1905 he married Grace Anna Goodhue, a teacher. They had two sons.

Political Career

A Republican, Coolidge entered politics as a city councilman in Northampton, Massachusetts, in 1898. In 1909 he was elected mayor of Northampton. He

Calvin Coolidge was the 30th president of the United States.

served as a Massachusetts state senator from 1911 to 1915 and as lieutenant governor from 1915 to 1918.

Coolidge was elected governor of Massachusetts in 1918. During a 1919 strike (refusal to work) by the Boston police, riots broke out. Coolidge sent the state guard to restore order. He became

1929

famous for saying that police officers did not have the right to strike.

In 1920 Coolidge became Harding's vice presidential running mate. They won the election with 60 percent of the popular vote.

Presidency

When Harding died suddenly in 1923, Coolidge became president. The public soon learned that Harding had allowed government officials to make illegal business deals. Coolidge quickly punished people involved in the deals. He restored people's faith in the presidency. In 1924 Coolidge easily won the presidential election.

Coolidge encouraged the expansion of industry. He also led Congress to reduce taxes. The economy grew significantly during his term.

Coolidge generally avoided international affairs. One exception was the Kellogg-Briand Pact of 1928, which Coolidge's secretary of state helped to create. In the pact, 62 nations agreed to end war as a way of solving conflicts.

Retirement

Despite his popularity, Coolidge decided not to run for reelection. In 1929 he retired to Northampton, where he wrote his autobiography and magazine and newspaper articles. He died of a heart attack on January 5, 1933.

Copenhagen

Population
(2008
estimate), urban
area,
1,153,615

Copenhagen is the capital of Denmark, a country of northern Europe. The city is a leading center of culture and education in Europe. It is also the largest city in Denmark. Copenhagen is located on the islands of Zealand and Amager.

In Copenhagen's harbor is a statue that some people say is the symbol of the city. The statue shows the Little Mermaid, a character from a fairy tale by Hans Christian Andersen. Andersen lived in Copenhagen most of his life.

Copenhagen is the center of business in Denmark. Many people in the city work for the government. Others work in banking, education, communications, and computer services. Factories in Copenhagen process foods and make medical equipment and medicines. Shipping and trade through the port also bring money to the city.

Copenhagen began as a small fishing village that grew up around the harbor. The village was settled by the 900s. In 1167 a fortress was built to protect the village. Copenhagen became the capital

Did You Know?

Copernicus, Nicolaus

The Polish astronomer Nicolaus Copernicus was the first person to state that Earth and the other planets travel around the sun. This was an important change in thinking. For hundreds of years before that, most scholars believed

that the sun, stars, and planets revolved around Earth. But they were mistaken.

Copernicus was born in Torun, Poland, on February 19, 1473. He studied in Poland and later in Italy. Copernicus learned several subjects, including astronomy, mathematics, medicine, and church law. Following his studies, he became an officer in the Roman Catholic church. In his spare time he observed the skies.

Copernicus developed many ideas about the solar system, or the sun and the objects that revolve around it. He correctly stated that Earth travels around the sun and also spins about its center. Copernicus published his ideas in a book in 1543. He died that same year, on May 24 in what is now Frombork, Poland. His book did not immediately change the way people viewed the solar

Nicolaus Copernicus

system, but later thinkers realized that his ideas were correct.

Coral

Corals are sea animals that stay in one place throughout their adult lives. Some types produce a skeleton, also called coral, that remains in place after they die. Corals can be very colorful underwater, but most types fade when they die or are removed from the water. Corals belong to the same animal group as sea anemones.

Where Corals Live

Corals live in all the oceans of the world. Some types live alone. Many types live together in groups called colonies. Several different types of corals together can form enormous colonies. These colonies are called coral reefs. The largest coral

Corals are small colorful animals that live in oceans all over the world.

reef in the world is the Great Barrier Reef off the coast of Australia.

Physical Features

The many types of coral include stony, soft, black, thorny, horny, and blue corals. As they grow, corals form different patterns and shapes. They may look like feathers, fingers, branches, or even a brain.

The body of a coral is called a polyp. The polyp is a hollow structure that attaches to a surface. Polyps of large corals may grow to about 10 inches (25 centimeters) across. Other corals have polyps as small as 0.04 inch (1 millimeter) across. At the top of the polyp is a mouth surrounded by tentacles. The tentacles bring small sea animals to the mouth. The tentacles also have stingers that paralyze, or freeze, corals' prey.

Corals have a skeleton that may be outside or inside the body. Stony corals have a hard, outside skeleton made of a mineral called calcium carbonate. As these corals die, new corals build up a colony on top of the dead corals' skeletons.

Life Cycle

To reproduce, corals produce eggs that develop into tiny, swimming creatures called planulae. Planulae eventually settle on a surface and develop into polyps. Corals also reproduce by budding. A bud is a new polyp that develops on the body of an old polyp. Some types of coral may live for hundreds of years.

Did You Know?

Corals are sometimes called the rain forests of the sea. Like rain forests, they are home to many different kinds of living things.

Corals and Humans

People have long used coral skeletons to make jewelry. But this and other human activities have put many corals at risk. Rising ocean temperatures, oil spills, and chemical pollution harm corals. Boats that float over reefs may also damage corals.

Coral Snake

Coral snakes are very poisonous snakes with bright color patterns. Red, black, and yellow or white rings circle a coral snake's body. These markings warn other animals that the snake is dangerous.

Coral snakes belong to the cobra family. There are about 90 species, or kinds, of coral snake. They live in the Americas, from the southern United States to Argentina. Most are found in the tropics. Similar snakes live in Africa and Asia. Many harmless snakes have ring

Coral snakes have brightly colored markings to show other animals that they are poisonous.

patterns like those of coral snakes. This makes other animals think they are dangerous.

Coral snakes have slender bodies with smooth scales. Most measure less than 3 feet (0.9 meter) long. Some South American varieties can grow longer than 4 feet (1.2 meters).

Coral snakes have short, hollow fangs that deliver a powerful venom, or poison. The venom attacks the nervous system and can be deadly to people. Most coral snakes are quick to bite when disturbed.

Coral snakes stay hidden in underground homes called burrows during the day. At night they come out to eat other snakes and small lizards.

Cork

Every year billions of bottles of wine, cooking oil, and other liquids are sealed with corks. Corks are made from the bark of a type of oak tree called the cork oak. The tree grows near the Mediterranean Sea.

The cork oak usually grows to be about 60 feet (18 meters) tall. Its wide-spreading branches give it a shape like an umbrella. Its narrow leaves are dark green and glossy.

The bark of the cork oak grows in two layers. The thick outer layer is the cork.

A worker cuts away the bark from a cork oak in Portugal. The bark will be used to make cork.

Tiny bubbles of air trapped between the cells of the cork make it spongy. After cork is removed from the tree, a new layer forms over a period of years.

How Cork Is Harvested

In the summer, workers cut slabs of the outer layer of bark from the tree. The slabs are stacked to dry and then boiled in water to remove any tree sap. Boiling also softens the cork, which makes it easy to press flat. The flattened cork can be cut into many shapes. It can also be ground into very small pieces and then mixed with glue and shaped to make various products.

Uses

Cork is useful as a stopper for bottles because liquids cannot pass through it. Cork is also a natural insulating material. It can be used to keep a house warm or to absorb sound. Because cork floats,

it is used to make life preservers and buoys. Cork is also soft and springy, making it good for shoe soles. It is also used to make bulletin boards.

Corn

Corn, or maize, is one of the most widely grown food plants in the world. People eat the plant's seeds, which are called kernels or grains. Corn belongs to the grass family. Its scientific name is *Zea mays*.

Corn first grew in the Americas. Early European explorers took corn to Europe. Today farmers grow corn in many areas of the world. The United States, China, Brazil, Mexico, and Argentina are major producers of corn.

The corn plant is tall. It has a stout stem with a tassel at the top. Large, narrow leaves grow out from the stem. Spikes grow from under the bases of the leaves. These spikes are a form of flower. They develop into ears, which contain the seeds that people eat. Leaves called shucks or husks surround each ear.

Rows of golden corn line a Nebraska field.

Did You Know?

A substance called high-fructose corn syrup is used to sweeten soft drinks. It is made from corn.

There are many varieties of corn plants. Native Americans grew corn with yellow, red, blue, pink, or black kernels. Today most corn has yellow kernels. Corn kernels may be soft, hard, starchy, or sweet. The hardest kernels are called popcorn. They explode when heated.

People in Latin America grind up corn kernels to make masa. Masa is a kind of dough used in tortillas, tamales, and other foods. In the United States sweet corn is a popular food. People often eat boiled or roasted corn on the cob. They also use the kernels in corn bread and other dishes. Farmers feed other kinds of corn to their farm animals. The parts of the plant that are not eaten may be made into paper, fuel, and other products.

Coronado, Francisco

In search of gold, Francisco Coronado led the first major European expedition north from Mexico. His travels in the 1540s established Spain's later claims to what is now the southwestern United States.

Francisco Vázquez de Coronado was born in Salamanca, Spain, in about 1510. He arrived in the New World in 1535 with Antonio de Mendoza, the new ruler of New Spain (Mexico). In 1538, after putting down a slave revolt,

Coronado became governor of a Mexican province.

At about that time the Spanish heard tales of towns filled with riches. Mendoza put Coronado in charge of a large expedition to find the towns and to bring back their treasures.

Coronado set out in 1540. In what is now New Mexico he indeed found cities, but they were made of adobe (sun-baked clay), not gold. They were the pueblos (villages) of the Zuni Native Americans. However, some of his men became the first Europeans to see the Grand Canyon.

In spring 1541 Coronado went on to what is now Kansas because a Native American woman had told him of another fabulously wealthy land called Quivira. It again turned out to be only an Indian village, but the Spaniards became the first Europeans to see the Great Plains and the large bison (buffalo) herds that roamed there.

In 1544 Coronado was charged with corruption and cruelty to the Native Americans. He was later removed from his governorship. He died on September 22, 1554.

Cortés, Hernán

The Spanish soldier Hernán Cortés conquered the great Aztec Empire in 1521. The conquest began 300 years of Spanish rule over Mexico.

Hernán Cortés (also called Hernando Cortez) was born in 1485 in Medellín, Spain. At age 19 he sailed for the island of Hispaniola in the West Indies. There he farmed and did legal work. In 1511 he helped Diego Velásquez conquer Cuba. Cortés became mayor of Santiago, the capital.

In 1518 Velásquez asked Cortés to start a colony in Mexico. While exploring the coast Cortés learned about the Aztec Empire. He landed at what is now Veracruz in April 1519. He burned his ships so his men could not turn back.

After defeating the Tlaxcaltec people in battle, Cortés made them his allies. The Tlaxcaltec and other tribes resented Aztec demands for sacrifices and treasure. On November 8, 1519, Cortés marched into the Aztec capital of Tenochtitlán (now Mexico City). The Aztec emperor Montezuma II welcomed Cortés because he thought he was a god of Aztec legend. Cortés quickly seized power.

Meanwhile, the jealous Velásquez sent a Spanish force against Cortés. Cortés defeated them, but while he was away the Aztec regrouped. They drove his forces back. Cortés then rejoined the Tlaxcaltec. He captured Tenochtitlán on

A painting shows Hernán Cortés leading a group of Tlaxcaltecs to the Aztec capital of Tenochtitlán.

August 13, 1521, ending the Aztec Empire.

The king of Spain made Cortés a nobleman. Cortés spent the 1530s in Mexico and explored Baja California in 1534–35. In 1540 he went back to Spain. He died there on December 2, 1547.

Cosmetics

Cosmetics are products that people put on their bodies to make themselves feel more beautiful. There are many types of cosmetics, including face makeup, nail polish, lotions, perfumes, and shampoos. Cosmetics are very popular today, and they were also used in ancient times.

Many people all over the world use cosmetics to make themselves feel more beautiful.

Types of Cosmetics

Many women use cosmetics for the face. Makeup, or foundation, gives the face color and highlights the features. Powder helps make the face look less shiny. Blush makes cheeks look rosy. Lipstick gives the lips color and shine. Eye shadow and eyeliner can make the eyes look bigger or more dramatic. Mascara makes the eyelashes thicker and darker.

Many types of oils and lotions can soften the skin on the hands and body. Shampoos clean the hair, and conditioners help keep the hair soft and healthy. People use hair creams, gels, and sprays to style the hair. Hair tints and dyes come in many different colors. Some are natural vegetable dyes such as henna, which has a reddish tone. Other hair color treatments use chemical bleaches.

History

Ancient Egyptians were the first people known to use cosmetics. Egyptian men and women used perfumed oils to keep their skin from drying out. They also used natural coloring on their eyelids and eyelashes. The Romans later introduced more types of cosmetics.

For much of history rich and powerful people were the main users of cosmetics. In the 20th century cosmetics became cheaper and more widely used. Today millions of people throughout the world use cosmetics every day.

Costa Rica

The Republic of Costa Rica is known for having the most stable democratic government in Central America. Its name means “rich coast.” The capital and largest city is San José.

Geography

Costa Rica is surrounded by Nicaragua, the Pacific Ocean, Panama, and the Caribbean Sea. Mountains—some with active volcanoes—run through the land. Earthquakes are also a danger. The coastal plains are hot year-round, while the mountains have milder temperatures.

Plants and Animals

Forests of broad-leaved, evergreen trees cover much of Costa Rica. The country has both North and South American types of animals. South American animals include monkeys, anteaters, and sloths. North American ones include deer, wildcats, and coyotes. Tropical birds, snakes, and iguanas are also common.

People

Most Costa Ricans are white. Many others are mestizos (people with mixed European and Native American roots). There are also small groups of Africans, Asians, and Native Americans. Spanish is the official language. Most people are Roman Catholics.

Economy

Manufacturing, trade, tourism, and other services are the main economic activities. Manufacturers make mainly food products and beverages. Exports include electronic parts and bananas.

History

Before Christopher Columbus arrived in 1502, Native Americans lived in what is now Costa Rica. The area was a colony of Spain until 1821, when it joined the Mexican Empire. In 1823 Costa Rica and four other countries declared their independence from Mexico as the United Provinces of Central America. Costa Rica left that union in 1838.

In 1890 Costa Rica held the first free and honest election in Central America. Despite brief revolutions in 1917 and 1948, the country developed peacefully. In the late 20th century Costa Rica helped to settle political fighting in neighboring countries.

Cotonou

Population
(2004 estimate)
818,100

Cotonou is the largest and most important city in the West African country of Benin. Although Porto-Novo is Benin's capital, the president and many government officials work in Cotonou.

Cotonou lies at the southern end of Benin on the Gulf of Guinea. It is an important port and the business center of Benin. The main products made in Cotonou are cloth goods, beverages, and palm oil.

Cotonou is also a lively city filled with street sellers and markets. The Artisanal Center offers arts and crafts made by local artists. The Marché Dantokpa is a

large, open-air market with many goods for sale. Cotonou's beaches attract many visitors. The National University of Benin is located in Cotonou as well.

The land around Cotonou was once known as Dahomey. In the 1800s the French slowly took control of Cotonou from the king of Dahomey. The French conquered all of Dahomey by 1894. Dahomey gained independence in 1960. The country finished building a modern port at Cotonou in 1965.

Cotton

Cotton is a fiber, or hairlike material, that people use to make cloth and other goods. Cotton grows on shrublike plants. Cotton plants belong to the mallow family, which also includes hollyhock and okra.

Where Cotton Grows

Cotton plants grow in warm areas in many parts of the world. Some of the top cotton-growing countries are China, the United States, Pakistan, India, and Uzbekistan.

Physical Features

In the wild, cotton plants may reach a height of 20 feet (6 meters). As a crop, cotton plants grow only 3 to 6 feet (1 to 2 meters) high.

Cotton plants produce white flowers that turn red and then fall away. The

Did You Know?

The boll weevil is the most troublesome pest that attacks cotton. Boll weevils destroy cotton bolls.

Women and children carrying goods on their heads show a traditional side of life in Cotonou, Benin.

A harvesting machine gathers the puffy buds of the cotton plant.

flowers leave behind a green pod, or fruit, called a boll. Inside each boll are 20 to 40 seeds. White fibers, which grow from the seeds' skins, surround the seeds. Eventually, the bolls burst open to reveal the fibers inside.

Different kinds of cotton plant produce fibers of different lengths. The longest fibers may be 2.5 inches (6.5 centimeters) long. These fibers go into the finest cotton cloth. Most cotton fibers are closer to 1 inch (2.5 centimeters) long.

Processing

Before cotton fibers may be made into cloth, they need to be cleaned and ginned. In ginning, a machine separates the fibers from the seeds. Next, a machine cards the fibers, or combs them into the same direction. Machines then pull and twist the fibers into long strands, called yarn. The yarn may be treated with chemicals, dyed, or combined with other types of fiber. Finally, a machine weaves the yarn into cloth.

Uses

Cotton is one of the most popular fibers worldwide. People use it to make clothing, sheets, towels, carpets, sails, and many other textiles, or cloth goods. Cotton cloth may be light or heavy. It is easily washable and comfortable to wear.

People use cottonseeds to make oil for cooking, cosmetics, and soap. Livestock eat cottonseeds and the leftover parts of cotton plants.

History

People in ancient India, China, and Egypt grew and used cotton. Early peoples in the Americas also grew cotton. Arab traders brought cotton to Europe by about AD 1000.

Cotton was difficult to process until 1793, when U.S. inventor Eli Whitney created the cotton gin. This machine separated cotton fibers from the seeds. Farmers in the U.S. South soon produced more cotton than ever before.

Cough

A cough is a sudden burst of air out of a person's lungs. Coughs happen when something irritates, or bothers, the respiratory system. The respiratory system is the group of organs that allows people to breathe.

Materials that cause a cough come from various places. Smoke, dust, chemicals,

A cough may be a sign of a cold or other illness.

and pollution in the air all can trigger a cough. Illnesses such as colds, influenza, and pneumonia also can cause a cough. These illnesses cause parts of the respiratory system to make more of a thick, sticky fluid called mucus. The mucus builds up and makes it harder to breathe. Coughing brings the mucus up and out of the mouth. Mucus may also drip down the back of the throat from the nose. Coughing helps to clear this mucus from air passages.

Coughing is good for the body. It is the body's way to get rid of anything in the respiratory system that does not belong there. However, a cough that does not go away may be a sign that the person has a serious disease.

Cold, Common • Respiratory System

Country

A country is land that is controlled by a single government. Countries are also called nations. Countries can be large or

small. Australia, Brazil, Canada, China, Russia, and the United States are large countries spread over millions of square miles. The world's smallest country, Vatican City, covers less than 1 square mile (2.6 square kilometers).

A country's land does not have to be connected. For example, the U.S. states of Alaska and Hawaii are separated from the other 48 states but are still part of the country. Some countries are made up of groups of islands. Indonesia and the Philippines are examples of island countries.

In some countries nearly all the people belong to a single ethnic group. These people are united by a shared history and culture. Denmark, Norway, and Sweden are examples. But other countries are made up of many different ethnic groups. Except for the Native Americans, the United States is made up of immigrants, or people who came from other countries. China and India, each with more than a billion people, have many different ethnic groups.

The flags of many countries fly outside the United Nations building in New York City.

Most countries are divided into smaller parts called states or provinces. A state has its own government. The country's government shares power with the state governments. The laws made by the country's government affect all the people of the country. The laws made by a state government affect only the people of that state.

Almost all countries belong to an organization called the United Nations, or the UN. The UN tries to solve disagreements between countries peacefully. It meets in New York City.

Country Music

Country music, also called country and western, is a style of music that began in the southern United States. The center of country music is Nashville, Tennessee. However, country music is played all over the United States and as far away as Australia. Many country songs are about the lives of people in rural areas and their difficulties.

Early country musicians played mostly fiddles, banjos, guitars, and string basses. Later musicians added electric basses, pedal steel guitars, keyboards, and drums.

Country music has its roots in the folk music of England, Scotland, and Ireland. Settlers brought this music to North America in the 1700s and 1800s.

A country music group performs on a river in Louisiana.

People in the Appalachian Mountains and other parts of the South created their own form of this folk music. Radio stations began broadcasting it in the 1920s. People called it hillbilly music until the 1940s. It then became known as country and western music.

The earliest popular performers of country music included Jimmie Rodgers and the Carter Family. In the 1930s such singers as Gene Autry and Roy Rogers sang country songs in movies about cowboys in the West. In the 1940s new types of country music included honky-tonk and bluegrass. Honky-tonk featured steel guitars, while bluegrass featured traditional banjos and fiddles. Hank Williams helped make honky-tonk popular. Bill Monroe is considered the inventor of bluegrass.

Some leading country performers of the 1950s and 1960s were Patsy Cline, Johnny Cash, Tammy Wynette, and Merle Haggard. Later country stars included Willie Nelson, Waylon Jen-

Cowbird

The brown-headed cowbird lives in North America.

As their name suggests, cowbirds often live among cattle and other large mammals. They feed on insects stirred up as these animals graze. Cowbirds are songbirds that are related to grackles, orioles, meadowlarks, and most types of blackbird.

Cowbirds are common in North America. The best-known species, or type, is the brown-headed cowbird. Another species, the bay-winged cowbird, lives in South America.

Most male cowbirds have shiny black feathers, while the females are usually

grayish brown. Male brown-headed cowbirds have brown heads and black bodies.

Bay-winged cowbirds are the only cowbirds that build their own nests. Most cowbird species lay their eggs in the nests of other types of birds. These other birds then sit on the cowbird eggs along with their own. When a cowbird chick hatches, the host birds often feed and care for it as if it were their own. Cowbird chicks tend to hatch a day or two before the other birds. They also grow quickly. These facts give them an advantage over the other birds when it comes to being fed.

Coyote

The coyote is a wild member of the dog family. Its scientific name is *Canis latrans*. It is known for its cleverness and its nighttime howls.

The coyote lives over a wide area, from Alaska in the north to Central America in the south. It can be found throughout the continental United States. Sometimes coyotes live near people, such as at the edges of cities.

Coyotes are similar to wolves, but they are smaller and more lightly built. Most adult coyotes weigh 20–50 pounds (9–23 kilograms) and are 3–4 feet (1–1.2 meters) long, including the tail. Their fur is long and full. Most coyotes are grayish brown with white on the

Cranberry

Cranberries are fruits with a sour taste. People use cranberries to make sauces, jellies, baked goods, and juice. Cranberries contain minerals and vitamins A and C.

Cranberries grow in wet, spongy soil in places called bogs. Cranberries grow in natural bogs in North America, Asia, and Europe. People also grow cranberries in bogs that they create themselves. The United States is the leading cranberry producer.

Cranberries may be round, oval, or pear-shaped. They range in color from pink to very dark red. Some are white.

Cranberries grow on small plants that form vines. Short branches grow from the vines. Small leaves and flowers grow on the branches. The flowers develop into berries. Botanists (people who study plants) call cranberries true berries. Like blueberries and other true berries, cranberries are single fruits that grow from a single flower. In contrast, strawberries

Cranberries grow well along the coast of the U.S. state of Washington.

and some other berries are really clusters of fruits that grow from one flower.

Cranberry growers usually collect the fruit by a method called water harvesting. First they flood the bog. Then they use machines to knock the berries off the plants. The berries float to the surface, which makes them easier to collect.

Crazy Horse

Crazy Horse was a war leader of the Oglala, a tribe of the Sioux Indians. He was born in about 1842 near what is now Rapid City, South Dakota. As early as 1865 he was leading his people in the Plains Indian Wars. The Indians waged these wars to stop non-Indians from invading their lands.

In 1868 Sioux leaders agreed to keep their people on a reservation. Crazy Horse refused to honor that agreement. He and his followers left the reservation for bison (buffalo) country, where they continued to hunt, fish, and wage war against enemy tribes as well as whites.

In 1874 gold was discovered in an area of the Sioux reservation that the Indians considered to be sacred ground. White miners ignored Indian treaties and swarmed over the area. Army troops were sent to protect the miners, but Crazy Horse and his followers forced them to leave in June 1876.

A huge statue of Crazy Horse is being carved out of a mountain in South Dakota. The model in front shows what the statue will look like when it is completed.

Later that month the Sioux fought U.S. soldiers led by Lieutenant Colonel George Custer. During this famous battle Custer and all of his men were killed.

Crazy Horse was pursued by U.S. troops. He finally surrendered on May 6, 1877. While being held prisoner at Fort Robinson, Nebraska, Crazy Horse was killed on September 5, 1877, during a struggle with U.S. soldiers.

Cree

The Cree are one of the largest Native American groups in Canada. They originally lived in the forests of eastern Canada. They eventually expanded their territory far into the plains of western Canada.

A Cree boy dressed in traditional costume attends an event in Canada.

The Cree traditionally hunted, fished, and gathered berries and wild plants for food. They used the bark of birch trees to build cone-shaped houses similar to tepees. They also used birch bark to make canoes.

In the early 1600s traders from France and England began arriving in Cree lands. The Cree traded furs to the Europeans in exchange for guns, tools, cloth, and other goods.

Over time some Cree moved west to the plains of what are now Saskatchewan and Alberta. These Cree became known as the Plains Cree. The Cree who stayed in the east became known as the Woodland Cree. By the late 1700s the Plains Cree had given up their old way of life. They got horses and began hunting bison (buffalo) on horseback. These Cree also built tepees.

In the 1800s the Cree lost much of their land to white settlers. Most Cree settled on reservations that the Canadian government set aside for them. At the end of the 20th century more than 60,000 Cree lived in Canada. About 2,500 Cree lived in the United States.

Creek

The Native Americans known as the Creek originally lived in a huge territory in what are now Georgia and Alabama. The Creek were a confederacy, or group, of separate tribes. The English called all of the tribes the Creek because they lived mainly along rivers and creeks. The Creek call themselves the Muskogee (or Muscogee).

The Creek divided their towns into “white towns” and “red towns.” White towns were dedicated to peace, and red towns were set apart for war planning and ceremonies. The Creek lived in rectangular houses made of pole frames cov-

Me-Na-Wa was a chief of the Creek people.

ered with mud. The roofs were made of grass or bark. The Creek planted fields of corn, beans, and squash. They also hunted and fished.

Spanish explorers invaded Creek territory in the 1500s. Later the Creek sided with English colonists in wars against the Spanish. In the early 1800s the Creek fought over land with European settlers. In the 1830s the U.S. government forced the Creek to move to Indian Territory (now Oklahoma).

The Creek later adopted European customs. They also became known as one of the Five Civilized Tribes, along with the Cherokee, the Chickasaw, the Choctaw, and the Seminole. At the end of the 20th century there were about 40,000 Creek. Most lived in Oklahoma.

Cricket

The chirping of crickets is a common sound in the summer. Crickets are jumping insects. Although they have wings, most are not able to fly. Crickets are closely related to grasshoppers.

There are about 2,400 species, or types, of cricket. They live in warm areas of the world. Crickets can be found in fields, trees, and bushes.

Crickets are 0.1 inch to 2 inches (3 to 50 millimeters) long. They are usually brown, black, or green. They have long,

Crickets make a chirping sound by rubbing their front wings together.

powerful hind legs that they use for jumping. Most crickets have two pairs of wings. The wings in the front are tough and stiff. The wings in the back are long and thin. They help crickets jump. Crickets also have long, thin antennae that they use to smell and touch.

Crickets are usually active at night. After spending the day hiding, they come out when it is dark to find food. Crickets eat mostly plants.

Crickets use chirps to communicate with each other. They chirp by rubbing their front wings together. Usually only male crickets chirp. They have different “songs” for different purposes. The most common songs are used to attract females.

Many people think that house crickets bring good luck. In eastern Asia male crickets are kept in cages so people can hear their songs.

Did You Know?

Some crickets chirp faster in higher temperatures.

Cricket

Cricket is an outdoor team sport played with a bat and ball. It developed in England. It is also very popular in places that England once ruled as colonies, such as Australia, India, Pakistan, South Africa, and the West Indies. More than 90 countries are members of the sport's governing body, the International Cricket Council.

Playing Area and Equipment

Cricket is played on an oval field. In the center of the field is a long rectangular area called the pitch. The pitch is 22 yards (20 meters) long and 10 feet (3 meters) wide. A marker called a wicket is set in the ground at each end of the pitch. Each wicket is made up of three sticks, called stumps, placed closely together. Two small pieces of wood, called bails, are placed on top of each wicket.

A cricket bat is about 3 feet (1 meter) long. The hitting surface of the bat is flat. A cricket ball is red or white.

Playing the Game

Two teams of 11 players compete in a cricket game, or match. The team that scores more runs (or points) wins. Cricket matches with scores in the hundreds are common.

When a cricket match starts, there are two offensive players in the pitch. They carry bats and are called batsmen. The batsmen stand at opposite ends of the pitch from each other, one near each wicket. One batsman, the striker, uses his bat to hit the ball. The batsman at the opposite wicket is called the non-striker.

The key player on the defensive team is called the bowler. The bowler stands near the wicket across the pitch from the

A diagram shows the layout of a cricket field and the positions of the players.

striker. The bowler tries to deliver, or bowl, the ball past the striker. The bowler takes a running start and then hurls the ball with an overhand, straight-arm delivery. Most balls are delivered so that they bounce in front of the striker and the wicket. The bowler tries to hit the wicket with the ball. If the ball knocks a bail off the wicket, the striker is dismissed, or put out. This means that his turn at bat is over.

The striker tries to keep the bowler from hitting the wicket. He also tries to hit the ball onto the field to score runs for his team. If the striker hits the ball, the two batsmen can run across the pitch to the opposite wicket. They can keep running back and forth between the wickets until the fielders put them out. Each time both batsmen reach the opposite wicket, they score a run.

Sometimes the striker hits the ball but decides that he does not have time to run to the opposite wicket. In such cases the batsmen do not have to run. Play continues, and the bowler delivers the next ball. The striker can earn six runs automatically (without running between the wickets) by hitting the ball over the field's outer boundary.

Fielders can dismiss the batsmen in a number of ways. For example, a fielder can catch a batted ball before it hits the ground. Also, a fielder holding the ball can dismiss a batsman by knocking a bail off a wicket before the batsman gets there.

A striker swings his bat.

Each batting session is called an innings (always plural). A team completes an innings after 10 players have batted. Cricket matches vary in length. Some matches last an afternoon. Others take days to complete.

History

People in England may have played cricket as early as the 1200s. A set of rules for the sport was written in the 1700s. In the 1800s and 1900s the English brought the game into their colonies throughout the world. An international cricket competition called the World Cup was first held in 1975. It takes place every four years.

Crime

A crime occurs when a person breaks a law. Governments pass laws against actions that they consider to be harmful or dangerous. If someone breaks a law they are punished in some way by the government that passed the law. Crimi-

Punishment for serious crimes often includes a stay in prison.

nal laws vary from place to place and change over time. This makes it difficult to say exactly what crime is.

Types of Crime

Different societies divide crimes into different groups. In the United States and the United Kingdom, the most serious crimes are called felonies. Murder and robbery are felonies. Governments often punish felonies with long prison terms or sometimes with death. Less serious crimes are called misdemeanors. Driving past a stop sign without stopping and shoplifting are misdemeanors. The punishment for a misdemeanor may be a short prison term or simply a fine.

Crimes can also be divided into attacks on people and attacks on property. A person can commit a crime against another person by hurting, kidnapping, or killing that person. A person can commit a crime against property by stealing it, damaging it, or destroying it.

Crime may affect just one person or an entire society. Governments view crimes

that affect many people as especially serious. Treason is the crime of betraying one's country. For example, trying to overthrow the government or helping the country's enemies are both forms of treason. Terrorism is the use of violence to achieve political goals. Terrorist crimes include bombing, hijacking, and assassination. War crimes break rules that have been established by many countries together. These rules establish how people should act during times of war. War crimes include mistreating prisoners or killing groups of innocent people. Governments work together to punish leaders who commit war crimes.

Organized Crime

Many criminals commit crimes on their own. Other criminals work in groups. Some groups of criminals run illegal businesses to make money. This is called organized crime. These criminals often sell drugs, weapons, or other illegal things that are considered to be harmful to society.

Shoplifting, or taking something from a store without paying for it, is a crime.

Crimea

The Crimea is a peninsula, or piece of land surrounded by water on three sides. It lies on the north shore of the Black Sea in Ukraine, a country in eastern Europe. The Perekop Isthmus is a strip of land that joins the peninsula to the mainland.

Steppes, or grasslands, cover the northern part of the Crimea. South of the

steppes lie the Crimean Mountains. The peninsula's climate is mild and dry.

The steppes and mountain slopes of the Crimea are very good for growing crops. Farms there produce wheat, corn, cotton, flowers, grapes, and tobacco. Crimeans also quarry, or mine, marble and limestone in the mountains. Tourism is another important part of the economy.

In the 1300s the Tatars, a Muslim people, settled in the Crimea. Russia took over the peninsula in 1783. The Crimea became part of the Soviet Union in 1921. In 1954 the Soviet government transferred Crimea to the Soviet republic, or state, of Ukraine. After Ukraine gained independence in 1991, Crimea became a republic of Ukraine.

Croatia

Formerly a part of the nation of Yugoslavia, the country of Croatia declared its independence in 1991. After several years of war, peace returned to Croatia in the late 1990s. The capital is Zagreb.

Geography

The Republic of Croatia lies on the Balkan Peninsula in southern Europe. The Adriatic Sea, to the southwest, separates Croatia from Italy. Slovenia, Hungary, Serbia, Montenegro, and Bosnia and Herzegovina form the rest of Croatia's borders.

Along the Adriatic coast are the region of Dalmatia and the Istrian peninsula. More than 1,000 small islands lie off the coast. The peaks of the Dinaric Alps rise in the western parts of Croatia. In the north is the Pannonian plain, where most farms are located. The Sava and the Drava are two of Croatia's largest rivers.

The Dalmatia region of Croatia borders the Adriatic Sea. The coastline is known for its beaches and picturesque cities.

Forests of beech, fir, and other trees cover less than one third of Croatia. Wildlife includes bears, deer, wild pigs, and lynx.

People

More than half of Croatia's people live in cities and towns. Croats, a Slavic people, make up about 90 percent of the population. Most follow Roman Catholicism and speak Croatian. Serbs make up less than 5 percent of the population. Most Serbs follow Eastern Orthodox Christianity and speak Serbian. There are smaller groups of Bosniacs (Muslims), Italians, Hungarians, and others. The civil war of the 1990s forced many ethnic minorities out of Croatia.

Economy

Mining and manufacturing are the most important industries in Croatia's economy. Croatia's natural resources include petroleum (oil) and the mineral gypsum. Factories produce food products, transportation equipment, electrical machinery, clothing, chemicals, and metals. Shipbuilding provides jobs along the coasts.

Services—for example, education, health care, and banking—are also important to the economy. Tourism is a growing industry.

Farmers grow corn, sugar beets, potatoes, wheat, and grapes to make wine. They raise pigs, sheep, and cattle, especially in the mountainous regions. Along the coast, fishing provides food and employment.

History

The Croats probably began to settle in what is now Croatia in the 500s. In the 900s, Croatia became an independent kingdom, but in 1091 Hungary conquered Croatia. For most of the next eight centuries Croatia remained a part of Hungary, and later Austria-Hungary. After World War I destroyed the empire of Austria-Hungary in the early 1900s, Croatia became independent.

Creation of Yugoslavia

Croatia then joined the newly formed Kingdom of Serbs, Croats, and Slovenes. The new nation united the lands of Serbia, Croatia, Slovenia, Macedonia, Bosnia and Herzegovina, and Montenegro.

An outdoor café sits among the remains of an ancient building in Split, Croatia.

In 1929 the state was renamed the Kingdom of Yugoslavia. After World War II, Communists took control of the country. They named it the Federal People's Republic of Yugoslavia.

Civil War

With the end of Communism in the late 1980s, old tensions between the nations of Yugoslavia resurfaced. In 1991 Croatia declared its independence from Yugoslavia, which was dominated by Serbia. Yugoslav troops invaded to try to stop Croatia from leaving. Some of the other republics of Yugoslavia also declared their independence, and the fighting spread throughout the area. As Yugoslavia fell apart, Serbs, Croats, and Muslims continued to fight. In 1995 the leaders of Croatia, Serbia, and Bosnia and Herzegovina finally signed a peace agreement. Croatia began to rebuild itself as an independent, democratic state.

Crockett, Davy

Davy Crockett

Davy Crockett was famous in his own time as a fighter, lawmaker, and frontiersman in a coonskin cap. After his death he became a hero of “tall tales” and a symbol of the American spirit.

David Crockett was born on August 17, 1786, in eastern Tennessee. To help support his family, he went to work as a cattle driver at age 12. He also became an excellent rifleman and hunter. Between 1813 and 1815 he served in the U.S. Army. He fought the British and their Native American allies during the War of 1812.

After returning home, Crockett became colonel of the Tennessee state militia, a citizen fighting force. In 1821 he was elected to the Tennessee legislature. He later served three terms in the U.S. Congress. Although he had little schooling,

his Army service and his folksy manner made him popular.

In 1835 Crockett went west to fight in Texas’ war for independence from Mexico. He died on March 6, 1836, when the Mexican army captured the Alamo in San Antonio. Crockett’s heroic death added to his legend.

Crocodile

Crocodiles are lizardlike, flesh-eating animals. They are the largest living members of the group of animals called reptiles. They are related to alligators.

Where Crocodiles Live

Crocodiles are found in parts of Asia, Africa, Australia, and the Americas. Most live in swamps, lakes, and rivers in hot and warm regions. Some live in the ocean. Although they spend most of their time in water, they also travel on land.

Physical Features

There are more than 10 species, or types, of crocodile. They vary greatly in size. The dwarf crocodile measures only 6 feet (1.8 meters) in length. On the

The estuarine crocodile is the largest living reptile in the world.

side view

alligator

crocodile

Crocodiles and alligators both have long snouts. But crocodiles have large teeth that stick out when the mouth is closed.

other hand, the estuarine crocodile may grow to more than 20 feet (6 meters).

Like alligators, crocodiles have tough skin composed of many large plates and scales. The eyes, ears, and nostrils are on top of the head. They allow a crocodile to see, hear, and breathe even when most of it is floating underwater. This helps it surprise and catch large prey.

Although crocodiles look like alligators, it is easy to tell them apart. When an alligator closes its mouth, none of its bottom teeth show. Many large teeth stick out of both the top and bottom jaw of a crocodile's closed mouth. Crocodiles also tend to have narrower, pointier snouts than alligators.

Behavior

Crocodiles eat mainly fish, turtles, birds, and other small animals. They capture water animals in their jaws with a side-ways motion. They seize land animals by the feet and drag them toward the water.

After crocodiles mate, the female lays eggs. Some types can lay more than 100 eggs. The female builds a nest of mud

and dead leaves to protect the eggs. But crocodiles do not take care of their young once they hatch.

Crow

The Native Americans called the Crow were great hunters and warriors of the northern Great Plains. They called themselves the Absaroka (Children of the Large-Beaked Bird), which was translated by Europeans as “crow.”

The Crow were originally united with the Hidatsa, a farming people who lived in what are now North and South Dakota. In the early 1700s the Crow broke away from the Hidatsa and traveled west, settling in the Yellowstone River region. There the Crow gave up

An old photograph shows a Crow woman holding her child in a cradleboard, which is worn on the back.

farming to become bison (buffalo) hunters.

While on the hunt, the Crow lived in temporary camps of cone-shaped tepees. They used bison skins to cover their tepees and to make clothing. They ate bison meat and also gathered berries, roots, and other wild plants for food.

In the early 1800s white traders and settlers began arriving in Crow territory. At first the Crow were friendly to the newcomers. Many Crow men joined the U.S. Army as scouts. In the 1860s and 1870s they helped the Army in battles against other Plains Indians. But at the same time American settlers disrupted the Crow way of life. White hunters killed the great bison herds. In 1868 the Crow agreed to move to a reservation in Montana that covered only a small part of their traditional homeland. At the end of the 20th century there were more than 9,000 Crow, mostly in Montana.

Native Americans

Crow

Crows are large birds with shiny black feathers. They often live together in large families. They are known for their loud voices and their intelligence. These clever, curious birds have a reputation as thieves and pranksters. They have been known to fly off with all sorts of little shiny objects, including people's car keys. Pet crows have even learned to mimic, or imitate, human speech.

Like all types of crow, the carrion crow has shiny black feathers.

Crows belong to the group of birds called songbirds. However, their calls are typically harsh sounding, as in the “caw” of the American crow. There are more than 20 species, or types, of crow. They look much like ravens, their close relatives. They are also related to jays and magpies.

Various types of crow are found nearly all around the world. They live in many different habitats, including woodlands, farms, and cities. The American crow is common in the United States and Canada. The carrion crow is found in Europe and much of Asia. Other well-known types include the fish crow, the pied crow, and the house crow.

Crows tend to be smaller than ravens. Large crows may reach about 20 inches (50 centimeters) long. They are all or mostly black. Crows have powerful

Crusades

In wars called the Crusades, Christians from Europe fought Muslims for control of Jerusalem and other holy places. The word *crusade* comes from the Latin word *crux*, meaning “cross.” The Christian soldiers, called Crusaders, wore the cross as a symbol of their religion. The Crusades took place between 1095 and 1291.

Jerusalem is a holy city to several religions. Muslims controlled Jerusalem for

hundreds of years before the Crusades. However, they allowed Christians to make pilgrimages to the city.

In 1071 a new Muslim group called the Seljuk Turks took control of Jerusalem. They were hostile to Christian pilgrims. They also attacked the Byzantine Empire, which was Christian. The Byzantine emperor feared that they would attack Constantinople (now Istanbul, Turkey), his capital. He asked the pope for help. In 1095 the pope urged Christians to take back Jerusalem.

First Crusades

The main army of the First Crusade left Europe in August 1096. The Crusaders captured Jerusalem on July 15, 1099.

Most of the Crusaders then returned home. Others stayed in the Holy Land and established Christian states. In 1144 the Turks captured one of the Christian states. German and French rulers then called for the Second Crusade. It was a failure for the Christians.

The Muslim leader Saladin conquered Jerusalem in 1187. The kings of England, France, and Germany launched the Third Crusade against him. They were not able to recapture Jerusalem. However, the English king signed a peace treaty with Saladin in 1192. It allowed Christian pilgrims to visit holy places in Jerusalem.

Crusades of the 1200s

The Fourth Crusade started in 1202. The Crusaders planned to attack the Muslims in Egypt. However, the plan

Did You Know?

The Roman Catholic church made King Louis IX of France a saint to honor his efforts as a Crusader.

A drawing from the 1200s shows European soldiers sailing to fight in the Crusades.

changed when the Crusaders passed through Venice. The Venetians got the Crusaders to capture Zara (now Zadar, Croatia), a Christian city that competed with Venice for trade. Then the Venetians and the Crusaders seized Constantinople. In 1204 they looted the city.

In 1212 two separate groups of children set out for Jerusalem. Some children died during the difficult journey. Others were captured and sold into slavery. Neither of the Children's Crusades got near Jerusalem.

French and German Crusaders reached Egypt in 1218 as part of the Fifth Crusade. In 1219 the Muslims offered to give up Jerusalem if the Crusaders would leave Egypt. The leader of the Crusaders refused. Later he was defeated.

Frederick II, the Holy Roman emperor, set out on the Sixth Crusade in 1228. He signed a treaty with the leader of Egypt that gave the Christians control of

most of Jerusalem. In 1244, however, the Turks took Jerusalem back. This led to the Seventh Crusade in 1249. Louis IX, king of France, was the leader. He was captured and held before being released in 1250. In 1270 Louis led the Eighth Crusade. He died of plague, however, and the Crusade failed.

The Crusaders then lost their fighting spirit. In 1291 the Muslims recaptured the last of the Christian states in the Holy Land.

Crustacean

Crustaceans are animals that usually have a hard covering, or exoskeleton, and two pairs of antennas, or feelers. People around the world eat many types of crustacean—for example, crabs, lobsters, shrimps (or prawns), and crayfish. Barnacles, water fleas, and pill bugs are

The American lobster is one of the largest crustaceans. It can weigh up to 44 pounds (20 kilograms).

Hermit crabs are crustaceans. Some people keep them as pets.

also crustaceans. All crustaceans are arthropods. This is a group of animals that also includes insects and spiders.

Where Crustaceans Live

Crustaceans live throughout the world, mainly in water. Some species, or types, of crustacean live in freshwater. Others live in salt water. Barnacles are sea crustaceans that usually attach themselves to surfaces—for example, rocks, boats, clams, or even whales. Some types of crab live both in water and on land.

Land crustaceans live in rocky, sandy, or muddy areas. Some types are so small that they live in the spaces between sand grains. Other types are found among damp leaves on forest floors.

Physical Features

The basic crustacean body consists of a number of segments, or sections. A section of the exoskeleton covers each segment. To allow the body to grow, the crustacean sheds, or molts, its exoskel-

eton from time to time. It then develops a new one.

At the front end of the body is a region called the acron. This is the head on most crustaceans. At this end, adult crustaceans often have antennae and mandibles, or jaws. Several pairs of limbs grow from the middle section of the body. Many species have different types of limbs for walking, swimming, or mating. Some species have limbs with pincers, or claws. The tail end differs in form, depending on the species.

One of the largest crustaceans is the American lobster, which may weigh up to 44 pounds (20 kilograms). Another large crustacean is the giant Japanese spider crab. Its legs may span up to 12 feet (3.7 meters). Water fleas, fairy shrimp, and brine shrimp are some of the smallest crustaceans. Most are shorter than 0.25 inch (6 millimeters).

Behavior

Crustaceans may eat plants, animals, or the remains of living things. Some types of crustacean live off the material on the bodies of fish or other sea animals.

To reproduce, crustaceans lay eggs. Some species carry the eggs on their body. The young of many species hatch from the eggs as larvae, or young that look nothing like their parents. In other species, the young look like tiny adults.

Did You Know?

Whale lice are crustaceans that live on the body surfaces of whales.

Crystal

In science, a crystal is a certain type of solid object. Scientists describe matter, or everything that can be seen, according to the way it is made. All matter is made up of tiny parts called atoms and molecules. If those parts are arranged in a regular pattern then the object is a crystal. On the outside crystals have a regular pattern of flat surfaces that meet in sharp corners.

Most matter that is not alive is made up of crystals. Common substances such as sugar and salt are made of crystals. So are metals such as gold, silver, copper, and iron. Diamonds, emeralds, and other gems (precious stones) are also crystals. Some objects that seem solid are not made of crystals, however. Glass is one such example. Its molecules are not arranged in any particular pattern.

Kinds of Shapes

The way a substance's atoms or molecules are joined together creates a crys-

Different substances form different crystal shapes. But all crystals of the same substance have the same shape.

tal's shape. Crystals form in many different shapes. However, all crystals of the same substance have the same shape. For example, salt molecules join together in a cube shape. Therefore, salt crystals are cubes. Sugar crystals are column-shaped and slanted at the ends. Quartz crystals are six-sided columns.

Objects that are not made of crystals do not always have the same shape. When glass breaks, it shatters into many pieces. These pieces have different sizes and shapes.

How Crystals Form

Most crystals form when a liquid changes to a solid. Water freezing is a familiar example of this process. As water freezes, its molecules line up and join to form ice crystals. Snowflakes are collections of ice crystals. Crystals also form when a liquid with matter dissolved (melted) in it dries up. For example, when salt water dries up, salt crystals form.

Cuba

The island of Cuba has seen many changes since it was spotted by Christopher Columbus in 1492. It became known worldwide for its sugar industry but often had an unstable economy. In the 1900s Cuba was involved in several national and international conflicts. Many of those concerned the country's ties to the political and economic system known as Communism. The capital is Havana.

Geography

Cuba lies in the Caribbean Sea, about 90 miles (145 kilometers) south of Florida. The country includes a long, narrow main island and about 2,000 smaller islands. Most of Cuba is made up of plains. Mountains and hills cover about a quarter of the main island. Cuba is warm year-round. Hurricanes sometimes hit the country in the summer and fall, during the rainy season.

Plants and Animals

Thousands of types of flowering plants grow in Cuba. Forests of tropical trees cover about one fifth of the land. Royal palms are common in rural areas. Animals include small mammals, iguanas, frogs, and scorpions. Sharks, mollusks, and manatees live in Cuba's waters.

People

About one third of Cuba's people are white, many with a Spanish background. A smaller number of people are

the descendants of African slaves. More than half of all Cubans have mixed white and black roots. Spanish is the main language. Although the government looks down on religion, many Cubans practice Roman Catholicism or Santería (a religion of African origin). About three fourths of the people live in cities.

Economy

Trade, services, and manufacturing are the most important economic activities. Much of the industry in Cuba is related to the country's agricultural and natural resources. Tobacco and food products are the major manufactured items. Sugar, made from sugarcane grown on large plantations, is Cuba's main export. Mines provide nickel, and the waters provide fish. Factories also make chemicals, transportation equipment, and nonelectrical machinery.

A band performs in Havana, Cuba.

History

Columbus claimed Cuba for Spain in 1492. After the Spanish began settling there in 1511, warfare and disease soon killed the native Taino and Ciboney peoples. The Spanish brought in African slaves to work on sugarcane plantations.

Following the Spanish-American War of 1898, Spain granted Cuba independence. The Republic of Cuba was established in 1902. It suffered from government instability, corruption, and widespread poverty.

In 1959 Fidel Castro overthrew the government and took power. He made Cuba a Communist country. Other Communist countries, particularly the Soviet Union, gave Cuba their support, and some Cubans hoped that Castro would put an end to the country's problems. Many Cubans who did not like Communism, however, left the country. In 1961 a force of 1,500 people who opposed Castro invaded the Bay of Pigs, southeast of Havana. They tried to capture Cuba but failed.

Cuba's relationship with the United States suffered because the United States opposed Communism. The United States refused to trade with Cuba. It also threatened Cuba in 1962, when it discovered that the Soviet Union had placed nuclear missiles in Cuba. The event became known as the Cuban Missile Crisis. It ended when the Soviets withdrew the missiles.

In 1991 the Soviet Union collapsed and Cuba lost an important source of support. But Castro remained in power until 2008, when his brother Raúl became president. Raúl made some changes, but the United States still limited trade with Cuba.

Cuckoo

An adult reed warbler feeds a large cuckoo chick.

The birds called cuckoos are named for the sounds they make. Because of their shy personality, these birds are more often heard than seen.

More than 125 different types of cuckoos are found throughout the world. Examples include the common cuckoo, the yellow-billed cuckoo, and the birds called roadrunners, coucals, and anis. Most cuckoos live in forests, where they hide in thick vegetation. Other types live in open areas. Most cuckoos eat insects, especially caterpillars.

Cuckoos range in length from about 6½ to 36 inches (17 to 91 centimeters). Most of them are drab gray or brown. A few types have some brightly colored or glossy feathers. The cuckoo has a long tail and medium to long legs. Its outer toes point backward. Its bill is usually short and curves down a bit.

Some kinds of cuckoos, including the common cuckoo, do not raise their own young. Instead, they lay eggs in the nests of other kinds of birds that have similar-looking eggs. In this way the cuckoos trick the other birds into keeping the cuckoo eggs warm and caring for the young cuckoos. However, many cuckoos, including the roadrunners, care for their own eggs and young.

Cucumber

The cucumber is a vegetable plant that people often make into pickles. It is related to melons, squashes, and pumpkins. The scientific name of the cucumber is *Cucumis sativus*.

People grow cucumbers all over the world. In colder places cucumbers grow in greenhouses. In milder places they grow in fields or in home gardens.

Cucumbers grow on vines. In the United States they are grown in home gardens as well as on large farms.

Cucumbers grow on long, creeping vines with fuzzy leaves. The parts that people eat are long, firm, and green. They develop from yellow flowers. The flesh inside a cucumber is pale green to almost white. In the center are small, white seeds.

Cucumbers are crisp and have a mild flavor. People eat cucumbers in salads and on sandwiches. People also pickle them, or preserve them with salt and vinegar. Cucumbers do not provide a lot of nutrition, but the green peel contains vitamins A and C.

Culture

Culture is a pattern of behavior shared by a society, or group of people. Many different things make up a society's culture. These things include food, language, clothing, tools, music, arts, customs, beliefs, and religion.

Weddings in the United States, Nigeria, and India show that different cultures celebrate marriage in different ways.

Differences and Similarities

Every human society has its own culture. Each culture is unique. A group's environment often decides the type of culture that develops. For example, a group that lives in a cold, mountainous region would develop a culture different from a group that makes its home in a hot, desert region.

Scientists who study human culture are called anthropologists. Anthropologists have found that certain parts of culture are universal. This means that all people all over the world share these behaviors. All societies have ways of dealing with relatives, telling good from bad, making art, playing games, choosing leaders, and raising children. However, each culture does these things in different ways.

How Culture Changes

Older people pass culture down to younger people. In this way a group can keep the same traditions for many years. However, culture also changes over time. This may happen when the environment changes. It also happens when

different groups come into contact with one another. Each group brings new ideas that can cause changes in the other group's culture. Sometimes conflict happens when different cultures come into contact. Other times the contact is peaceful, and the groups share their cultures in positive ways.

Earliest Culture

Culture began to develop after early humans began to make tools. Humans eventually developed customs around the creation and the use of tools. These customs were early forms of culture.

Cumberland Gap

A natural mountain pass, the Cumberland Gap is located near the point where Kentucky, Virginia, and Tennessee meet. It was cut through the Cumberland Plateau in the eastern United States by streams many years ago.

Thomas Walker discovered the pass in 1750. American frontiersman and hero Daniel Boone helped build the Wilderness Road, the first trail through the pass, in the 1770s. The gap was named for the duke of Cumberland, who was the son of King George II. It became the main route used by pioneers moving west to settle the land beyond the Appalachian Mountains.

In 1940, 32 square miles (83 square kilometers) of the plateau, with the gap as the central feature, were reserved as the Cumberland Gap National Historical Park.

Curie Family

Four different members of the Curie family played an important role in the history of nuclear physics. The science of nuclear physics deals with the nucleus, or center, of atoms. All four Curies earned Nobel prizes for their work.

Fog swirls around the Cumberland Gap.

Marie Curie

Marie and Pierre

Marie Curie was born Maria Skłodowska in Warsaw, Poland, on November 7, 1867. Her family valued education, but women were not allowed to study at the University of Warsaw. Instead, Maria saved enough money to study in Paris, France. In 1891 she entered the Sorbonne, a university in Paris. In France she began calling herself Marie.

Marie completed degrees in physics and in math within three years. She then began doing research in the laboratory of chemist Pierre Curie. Pierre was born in Paris on May 15, 1859. He and Marie married on July 25, 1895. They had two daughters, Irène and Ève. Irène became a scientist like her parents. She was born in Paris on September 12, 1897.

Their Work

Marie began studying the rays (beams of energy) given off by the element ura-

nium. She named the unusual activity of these rays radioactivity. Pierre soon joined Marie in her research. In 1898 the Curies announced their discovery of polonium and radium, two other elements that were radioactive. In 1903 they won the Nobel prize in physics for their work. The Nobel prize is the most important award that a scientist can receive. The Curies shared the prize with Henri Becquerel, who first discovered uranium rays.

Pierre died on April 19, 1906, after being run over by a horse-drawn carriage. Marie continued their research. In 1911 she received the Nobel prize in chemistry for her many further discoveries.

Irène and Frédéric Joliot

Irène Curie began to work at her mother's side. She earned an advanced degree in physics in 1925. In 1926 Irène married Frédéric Joliot, another scientist working in her mother's laboratory. Frédéric was born in Paris on March 19, 1900. In 1934 the couple discovered that radioactivity could be made artificially. The following year they won the Nobel prize in chemistry for their work.

Marie did not live to see her daughter accept the award. Her many years of exposure to harmful radioactivity had made her very sick. She died on July 4, 1934. Irène died on March 17, 1956. Frédéric died on August 14, 1958.

Custer, George Armstrong

In 1876 Lieutenant Colonel George Armstrong Custer led his U.S. Army unit into battle against a group of Native Americans. This group consisted of Sioux, Cheyenne, and Arapaho. Custer and all his men died in the battle, called the battle of the Little Bighorn. Yet Custer remains one of the best-known and most popular figures in U.S. history.

Early Life

George Armstrong Custer was born in New Rumley, Ohio, on December 5, 1839. He spent most of his childhood in Monroe, Michigan. After high school he

George Armstrong Custer

enrolled at the United States Military Academy at West Point, New York.

Army Career

During the American Civil War, Custer fought for the North. He was famous for being very brave and aggressive. When the Civil War ended, Custer became lieutenant colonel of an Army unit called the 7th Cavalry.

In 1874, looking for gold, Custer led soldiers into the Black Hills of what is now South Dakota. The U.S. government had recognized the northern Great Plains as the sacred hunting grounds of certain Native American tribes. Many white miners, however, ignored that fact and began to settle on the hunting grounds. When the Native Americans complained, the government ordered the U.S. Army to drive them off the land.

Custer's unit was supposed to prevent the Native Americans from escaping attack by the main force of soldiers. Instead, Custer ordered an attack on a group that had been assembled by the Sioux chief Sitting Bull in a nearby camp. Custer's attack was one of the greatest disasters in the history of the U.S. Army. The Native Americans surrounded Custer's force near the Little Bighorn River and killed all the men.

Death and Legend

Custer died with the rest of the 7th Cavalry on June 25, 1876. After Custer's death, people remembered him as a hero. The battle of the Little Bighorn became the subject of songs, books, and paintings.

Did You Know?

Custer once left his post to go visit his wife. The Army suspended him for one year without pay.

Custer's reputation slowly changed in the late 20th century, when people began to recognize the Native American side of the story. In 1991 the U.S. Congress changed the name of the battlefield monument from the Custer Battlefield to the Little Bighorn Battlefield.

Cycling

The use of a bicycle for pleasure, transportation, or sport is known as cycling. Both children and adults ride bicycles for fun and for exercise. Some people use bicycles for transportation because it is less expensive than traveling by car. Others use bicycles for transportation because bicycles, unlike cars, do not pollute the air.

The sport of cycling consists of races that are held mostly on roads or tracks. Sport cycling began in 1868 with a race near Paris, France. The first recorded

Russian cyclists compete at the 2004 Olympics.

Some of the world's top cyclists compete in a championship road race. The International Cycling Union holds world championships every year.

race in the United States was held in 1878 in Boston, Massachusetts. The most famous bicycle race, the Tour de France, began in 1903. Cycling is also a part of the Summer Olympic Games.

Road Racing

Sport cycling includes road races for men, women, and children. Some races cover short distances of 2.5 to 3 miles (4 to 5 kilometers). Others cover hundreds of miles. A stage race consists of a series of races held over several days or even weeks. The Tour de France is a stage race that covers more than 2,200 miles (3,500 kilometers), mainly in France. It takes three weeks to complete. The world's best riders compete in it.

Time trials are a type of competition in which cyclists do not race directly against each other. Instead, individual cyclists or teams are timed as they ride separately over a certain distance. The cyclist or team with the fastest time wins. Most stage races include time trials.

Track Racing

Several types of bicycle races are held on an oval track. The track may be either indoors or outdoors. In the high-speed races called sprints, cyclists compete against each other over a short distance. The pursuit is an event in which cyclists start on opposite sides of the track and try to catch each other. In a motor-paced race, each cyclist rides behind a motorcycle or motorbike. The motorcycle cuts through the wind, which normally slows a bicycle down. As a result, cyclists can go much faster than they can in other races.

Another form of track racing is bicycle motocross (BMX). BMX races are held on short dirt tracks with many jumps and turns.

Cypress

Cypresses are evergreen trees and shrubs. There are about 20 different species, or types, of cypress. They grow in warm parts of Europe, Asia, and North America.

Cypresses reach heights of 80 feet (25 meters) or more. Some cypresses have a pyramid shape. Others grow into tall columns. The bark is sometimes smooth, but it usually forms plates or strips. The leaves are small and overlapping. They look like scales covering the branches.

Cypress trees stand along a winding road in Italy.

Cypresses belong to the large group of plants called conifers. This means that they produce cones that hold their seeds. Cypress cones have a woody or leathery covering and are usually round.

Cypress wood resists rotting and pests. For this reason people use cypress wood to make fences, docks, and other outdoor structures. People also plant cypresses in parks.

Only the plants belonging to the scientific group called *Cupressus* are true cypresses. But other trees are also called cypresses. The trees called false cypresses differ from true cypresses because they have smaller cones with fewer seeds. Bald cypresses grow in swampy parts of southern North America. They are known for their knobby “knees,” which are actually part of their root system.

Did You Know?

Some cypresses are rare trees. The Monterey cypress can be found growing wild only in two groves near the central California coast.

Cyprus

The island of Cyprus has been divided for many years between its Greek and Turkish populations. The Republic of Cyprus is the official government of the island. Only Turkey considers the Turkish Republic of Northern Cyprus, which controls the northern third of the island, to be a separate country. The capital of both states is Nicosia—called Levkosía in Greek and Lefkosa in Turkish.

Geography

Cyprus lies in the eastern part of the Mediterranean Sea. It is about 40 miles (64 kilometers) south of Turkey and 480 miles (772 kilometers) southeast of mainland Greece.

Cyprus has mountains in the north and the south with a flat plain in between. Its long coastline is jagged and rocky, with sandy beaches. Cyprus has hot, dry summers and rainy winters. Its rivers

The sandy beaches of Cyprus are a popular vacation spot.

flow only in the winter; they dry up in the summer.

Plants and Animals

Olive, carob, and citrus trees grow in the north. Pine, dwarf oak, cypress, and cedar forests cover the southern Troodos Mountains. Wildflowers and flowering bushes grow in the central plain.

Many years ago the island was home to elephants, hippopotamuses, deer, and boars. The only large wild animal in Cyprus today is the agrino, a type of wild sheep. Millions of birds fly over Cyprus during their migrations each year, and many types spend winters there. Green and loggerhead turtles are found on the island's beaches. They are protected by law.

People

The two main ethnic groups of Cyprus are Greeks and Turks. Greek Cypriots make up the majority. They are mostly Eastern Orthodox Christians. The Turkish Cypriots are Muslims. Greek and Turkish are the official languages, but English is considered a second language in both populations. Most of the people live in cities.

Economy

Services, including tourism, are the main economic activities of Cyprus. Manufacturing and construction are also important. Greek Cyprus produces food products, cement, cigarettes, wine, and vehicles. Turkish Cyprus produces mainly clothing. Farms in both areas grow citrus fruits and potatoes.

History

People have lived on Cyprus for more than 7,000 years. The first Greek settlers arrived between 2000 and 1000 BC. They founded new cities, which became the capitals of six ancient Greek kingdoms on Cyprus. Later, the Persians, the Egyptians, the Roman Empire, and the Byzantine Empire took control at various times.

The Ottoman Turks captured Cyprus in 1571 and continued ruling for more than three centuries. The British leased Cyprus from the Ottomans in 1878 and took it as their own in 1914.

After World War II (1939–45) the long-standing conflict between the Greek and Turkish communities intensified. Many

Part of an ancient Roman temple still stands in Cyprus. The ancient Romans began ruling Cyprus more than 2,000 years ago.

Greek Cypriots wanted to be part of Greece, while many Turkish Cypriots wanted the island split into two political areas. Cyprus gained independence in 1960, but the two groups soon began fighting.

In 1974 the military forced out the president of Cyprus, and forces from Turkey invaded the north. In 1975 the northern part of the island became the Turkish Federated State of Cyprus. The north declared itself the independent Turkish Republic of Northern Cyprus in 1983. This declaration was condemned by the United Nations. By the early 21st century the two sides were working toward reunification, but only Greek Cyprus joined the European Union in 2004.

Czechoslovakia

The country called Czechoslovakia existed in central Europe from 1918 through 1992. It was formed after World War I from parts of the defeated empire called Austria-Hungary. On January 1, 1993, Czechoslovakia split into two countries: the Czech Republic and Slovakia. The capital of Czechoslovakia was Prague.

Geography and People

Czechoslovakia shared borders with Germany, Poland, Ukraine, Hungary, and Austria. Its three main regions were Bohemia, Moravia, and Slovakia. The Bohemians and the Moravians together were known as Czechs. They had most of the power, which angered the Slovaks.

Most of the people of Czechoslovakia spoke Slavic languages. However, there

were many German speakers in an area called the Sudetenland.

History

During World War II, Czechoslovakia was taken over by Germany. In 1945, as the war was ending, the army of the Soviet Union freed Czechoslovakia. Then Communists backed by the Soviets took control. Czechoslovakia struggled under Communist rule. Its farms produced fewer crops. The people lost many freedoms.

The Communist government was unpopular. In 1968 a leader named Alexander Dubcek tried to make the government more democratic. The Soviet Union did not like the changes. It forced out Dubcek. The new government went back to strict control.

In the 1980s protests against the government began to work. In 1989 the Communist government resigned. Václav Havel became the country's first non-Communist president in more than 40 years. The last Soviet troops left in 1991.

After Communism ended, relations between Czechs and Slovaks worsened. The people of Slovakia voted to form a separate country. At midnight on December 31, 1992, Czechoslovakia broke up. The Czech Republic and Slovakia took its place.

Austria-Hungary • Czech Republic
• Prague • Slovakia • Union of Soviet Socialist Republics

Czech Republic

The Czech Republic is a country in central Europe. It was formerly part of the Communist country of Czechoslovakia. The independent Czech Republic came into being in 1993. The country is known for its picture-book towns, its polka dance, and the architecture of its capital, Prague.

Geography

The Czech Republic is bordered by Slovakia, Austria, Germany, and Poland. Low mountain ranges surround the country. In the southwest is the large Bohemian Forest. The country's main river is the Elbe, which flows into Germany. Most parts of the Czech Republic have a moderate climate. Winter temperatures are mild, and summers are warm. Snow and rain are heaviest in the mountains.

Plants and Animals

Spruce and fir trees are common in the high forests. Oak, ash, and maple trees grow at lower levels. Pollution from the use of coal has severely damaged the forests, however. The country's animals include wild boars, brown bears, marmots, otters, mink, and deer.

People

Czechs make up about 90 percent of the country's population. Moravians form the largest minority group. Other ethnic groups include Slovaks, Poles, Germans, and Roma (Gypsies). The official language is Czech, a Slavic language closely

related to Slovak and Polish. About 40 percent of the people are Roman Catholic. Many people follow no religion. About 75 percent of the population lives in urban areas.

Economy

Manufacturing is the most important part of the Czech Republic's economy. Factories produce machinery, food products, metals, cars, computers, chemicals, and other goods. The country has limited resources of coal, petroleum (oil), natural gas, and minerals. It must import many of the raw materials needed for its factories.

Trade, tourism, banking and other services are also important to the economy. Agriculture is a smaller part of the economy. The main crops are wheat, barley, corn, sugar beets, and potatoes.

© 2006 Encyclopædia Britannica, Inc.

A field of yellow flowers brightens the countryside in the Czech Republic.

History

Germans, Celts, and Avars were some of the first peoples in Moravia and Bohemia, the two main provinces of the Czech Republic. The Slavs, ancestors of the Czechs, arrived between the 500s and the 700s. By the mid-800s the Moravians had formed a kingdom. It eventually grew into Great Moravia and included part of Poland, all of Bohemia, and part of Hungary.

The decline of Moravia in the early 900s led to the rise of Bohemia. In 1029 Moravia became part of the kingdom of Bohemia. In 1526 Bohemia and Moravia came under the control of the Hapsburg monarchy of Austria. Austria, and later the empire of Austria-Hungary, ruled Bohemia and Moravia until after World War I (1914–18).

When Austria-Hungary collapsed in 1918, Bohemia, Moravia, and neighboring Slovakia were united to form the independent republic of Czechoslovakia. Czechoslovakia soon became a Communist country. Václav Havel, a playwright and poet, was elected president of

Czechoslovakia after Communism ended in 1989.

On January 1, 1993, Czechoslovakia peacefully split into the Czech Republic and Slovakia. Havel became the first president of the Czech Republic. In 2004 the country joined the European Union.

Did You Know?

Daedalus was also known as an architect and a sculptor. In ancient times many temples and statues in Greece and Italy were believed to be his work.

Daedalus

In ancient Greek mythology Daedalus was a great inventor. His son was named Icarus. Daedalus was said to have built a complex maze for King Minos of Crete. The maze was built to enclose a monster called the Minotaur. Later the king learned that Daedalus had given away the secret to the maze. He became angry and imprisoned Daedalus and Icarus in the maze.

Daedalus made wings of wax and feathers so that he and Icarus could fly to freedom. Before they escaped, Daedalus warned Icarus not to fly near the sun. The sun's heat would melt the wax. The two easily flew out of the maze. Excited by his ability to fly, Icarus soared through the sky. But he got too close to the sun, and his wings melted. Icarus fell into the ocean and drowned.

Mythology

Dahl, Roald

The funny and imaginative children's stories of British author Roald Dahl are favorites with readers both young and old. His action-packed tales feature memorable and often magical characters.

Roald Dahl was born in Llandaff, Wales, on September 13, 1916. His early life was difficult. When he was only 3, his sister and father died. Soon after, the family moved to Kent, England.

Daedalus made wings of wax for himself and his son Icarus. They used the wings to fly out of the maze in which they were trapped.

When World War II began in 1939, Dahl joined the British Royal Air Force. He was seriously injured during a crash

Roald Dahl

landing. Dahl's first writings were about his experiences in the military. His first children's book, *The Gremlins*, was published in 1943. It is about mythical creatures who make fighter planes crash.

During the 1950s Dahl wrote short stories for adults. After he became a father, he started making up bedtime stories for his children. In 1961 he published *James and the Giant Peach*. It was followed in 1964 by *Charlie and the Chocolate Factory*, which is about a poor child whose luck changes when he visits an extraordinary candy factory.

Dahl's later children's books included *Danny: The Champion of the World* (1975), *The BFG* (1982), and *Matilda* (1988). He died in Oxford, England, on November 23, 1990.

Literature for Children

Dahomey

In the 1700s and 1800s an African kingdom known as Dahomey grew rich and powerful through the slave trade. The kingdom was located on the west coast of Africa. The region is now the southern part of Benin.

Dahomey had a system of social classes. The king was at the top. Under him was the royal class, followed by commoners, and then slaves. Each government office was filled by one male and one female official. The women checked on the men and reported back to the king. Women also served in Dahomey's powerful army.

The kingdom of Dahomey arose in the 1600s from another kingdom called Alladah. European slave traders were already visiting the Atlantic coast during this time. Dahomeans began capturing people from other tribes. They sold the captives to slave traders in return for weapons and other goods. They also

© 2006 Encyclopædia Britannica, Inc.

kept slaves of their own. These slaves worked on large farms that supplied food for the army and the royal court.

The empire grew larger and stronger throughout the 1700s. After Great Britain and other countries outlawed the slave trade in the 1800s Dahomey started selling palm oil instead of slaves.

At the end of the 1800s France conquered Dahomey. The French combined it with other regions to form a colony that was also called Dahomey. This colony gained its independence in 1960. It kept the name of Dahomey until 1975, when it became Benin.

Dalai Lama

The Dalai Lama is the leader of the main sect, or group, of Buddhists in Tibet. Tibetan Buddhists believe that the Dalai Lama is the god of compassion who comes to Earth to help people. Until 1959 the Dalai Lama also ruled Tibet.

Tibetan Buddhism is a form of Buddhism that began in Tibet some 1,400 years ago. Its followers believe in reincarnation, which is the idea that after death a person's soul is born again in a new body. They believe that each Dalai Lama is a rebirth of the first Dalai Lama, who died in 1475.

The 14th Dalai Lama leads a prayer meeting in Varanasi, India.

When a Dalai Lama dies, Tibetan Buddhist leaders use different ways to discover where he will be reborn. They may consult an oracle, who is a holy person believed to have a message from a god. The leaders look for a child born soon after the previous Dalai Lama dies. The child must pass many tests to prove that he is the Dalai Lama. For example, the child is usually asked to identify objects that belonged to the previous Dalai Lama.

Did You Know?

The Dalai Lama is the head of the group known in English as the Yellow Hat order of Buddhists. They are called that because they wear a yellow headdress.

Once the child has passed the tests, he officially takes the throne. The Dalai Lama spends much of his time studying Buddhism and meditating.

The current Dalai Lama, Tenzin Gyatso, is the 14th Dalai Lama. He was born in 1935 to a peasant family. Before his 5th birthday he was named as the Dalai Lama. In 1950 he became the head of Tibet's government. In the same year the Chinese entered Tibet and took control of the area.

In 1959 the Chinese killed more than 80,000 Tibetans who were protesting Chinese rule. The Dalai Lama and some followers fled to India and settled in the mountains.

The 14th Dalai Lama travels around the world to promote peace and to speak about the Tibetans' desire for political independence. In 1989 he won the Nobel peace prize for his nonviolent work to end Chinese control of Tibet.

Dallas

Population
(2000 census),
city, 1,188,580;
(2007 estimate)
1,240,499

Dallas is one of the largest cities in the United States. It is located in the north-eastern part of the state of Texas. Dallas lies on the Trinity River, near where the river's three branches come together.

Dallas is a center of banking, insurance, and publishing. Trade, health care, and business services are also important to the city's economy. Factories in Dallas make such products as computers, software, processed foods, and clothing.

A lawyer named John Neely Bryan founded Dallas in 1841. The town grew as a center of trade. In the early 1900s one of the world's largest cotton markets was in Dallas.

In 1930 a huge oil field was discovered in eastern Texas. Dallas grew large and wealthy as a center of the oil industry. During the middle of the 1900s many factories in the city made aircraft for the military.

Dallas' oil industry declined in the 1980s. However, the city continued to grow. Many high-technology companies

established themselves in Dallas in the late 20th and early 21st centuries.

Dam

A dam is a barrier that blocks flowing water or sends it in a new direction. People and animals build dams to control rivers and to create ponds or lakes. A beaver's dam works in much the same way as the giant dams that people build. Both must be high enough and strong enough to keep the water from flowing forward.

People throughout the world have built dams since ancient times. Early Egyptians built a dam almost 5,000 years ago. The Chinese built stone structures to block rivers as early as 240 BC. Two dams in Spain that were built by ancient Romans are still in use today.

Uses

People build dams to keep rivers from flooding and to save water. During heavy rains a river's waters may rise too high. Without a dam to contain it, the extra water is wasted as it flows away unused.

With a dam in place, a deep reservoir, or pool, of water builds up behind the dam. This extra water can be put to many good uses. It might be used as a lake for boating or swimming, for drinking water, for farm irrigation, or in manufacturing.

The Hoover Dam is 726 feet (221 meters) high. It is on the Colorado River between Nevada and Arizona.

The force created by water rushing through pipes in a dam is also useful. The flowing water makes wheels called turbines spin. The turbines run machines called generators, which produce electricity. This type of power is known as hydroelectric power.

How Dams Work

Most dams operate in the same basic way. The weight of the water pushing against a dam creates tremendous pressure. A dam's shape and thickness must work together to hold the water back, even when rainfall increases the pressure.

The dam wall must be made of something strong enough to keep water from breaking through. Some dams are made of earth and rock packed together to form a thick barrier. However, most dams are made of concrete. Some concrete dams are thicker at the bottom than they are at the top. They are built

that way because water creates more pressure as it gets deeper. The bottom of the dam must be thicker and stronger to hold back the deeper water. Other concrete dams have a curved shape that helps to lessen the pressure of the water. The curve sends some of the pressure to the rock walls on the sides of the dam.

A spillway is a passage over or around the dam wall. If the water behind the dam builds up to a dangerous level, some of the water is released through the spillway.

Passages called sluices are other important parts of a dam. Some water constantly moves through these passages to keep the river flowing on the other side of the dam. Gates in the passages allow workers to control the amount of water that flows through the dam.

Damascus

Population
(2004 estimate)
1,614,500

Damascus is the capital of Syria, a country in the Middle East. It is one of the world's oldest cities. For thousands of years Damascus has been an important

People walk through the entrance of a mosque in Damascus.

trading center. Today it is also Syria's center of education and culture.

Damascus is surrounded by desert. However, the city gets plenty of water from the Barada River. The only easy route through the Anti-Lebanon Mountains ends in Damascus.

Many people in Damascus work for the government. Others work in education, health care, tourism, and other businesses. Factories in the city make processed foods, cloth, chemicals, plastics, and machinery.

Damascus is at least 5,000 years old. In ancient times many groups fought to control the city and its trade.

Muslim Arabs took over Damascus in AD 635. It was the capital of the Muslim world from 661 to 750. Damascus was later an important city in a series of Muslim empires.

The Turks ruled Damascus from the 1500s to the early 1900s. It remained a major trade center. People traveling to the Muslim holy cities also bought supplies in Damascus.

France took control of Syria in 1920. Damascus underwent many changes to become more modern. In 1946 Syria became an independent country with Damascus as its capital. The city grew greatly during the 20th century.

Dance

Dance involves the rhythmic movement of the human body, usually to music. It is one of the oldest forms of human expression. Dance movements are often closely related to the gestures of everyday life.

Dance serves a variety of purposes in cultures around the world. Some dances mark special social events such as births, marriages, and deaths. Other dances are religious or magical. They may be performed to worship gods or to try to end famine, bring rain, or cure the sick. And dances are also performed as art, to express emotions, to tell stories, and simply for fun.

Types of Dance

There are many kinds of dance. Certain dances are associated with particular ethnic groups or cultures. They are often deeply woven into everyday life. For instance, in many societies in Africa dances are an important part of community life.

Folk dances come from a particular country or location. But these dances are no longer associated with their original purposes or meanings. Instead, people

Members of a U.S. dance company perform a dance called *Split Sides*.

often perform folk dances for entertainment and to preserve the dance traditions of their ancestors.

People perform social dances for their own entertainment. Social dances include ballroom dances such as the waltz and tango as well as newer forms such as hip-hop. On the other hand, trained dancers perform theatrical dances. They dance to entertain an audience or to provide an audience with an artistic experience. Some styles of theatrical dance are ballet, modern, jazz, tap, and classical Indian dances.

Elements of Dance

The movements of dancers' bodies create different shapes and patterns in space. Dance movements tend to be organized into a sequence of steps. The steps of traditional dances have been passed down over many years. In other dances the dancer makes up the movements during the dance. Or sometimes a dance designer called a choreographer makes up the steps ahead of time.

Rhythm is a major element in dance. Rhythm helps pace the movement. It helps give dance its emotional power too. Rhythm can also match or contrast the dancer's movements to the music.

Most dancing is done to music. The music may suggest the style or dramatic quality of a dance. One example is the Middle Eastern form of dance called *raqs sharqi* (or belly dance). In this style of dance the music sets up the mood or story. The dancer then interprets this through movement. In ballet whole sections of music may have the style of the character dancing to them.

Many types of dance are associated with special clothing. For instance, dancers may use weapons, masks, and makeup to increase the effect of war dances and hunting dances. Wearing certain clothes for ritual dances can also show that it is a sacred occasion. Theatrical dances may use costumes, scenery, and lighting. These elements may help tell a story, set a mood, or create interesting visual patterns.

History

Ancient Dance and Traditions

Paintings made in caves more than 10,000 years ago suggest that even the earliest peoples danced. The first written records of dance date back some 4,000 years to the ancient Egyptians. Dance was a crucial element in festivals for their gods. The ancient Egyptians also brought skilled dancers from central Africa to Egypt to provide entertainment.

Couples dance the tango in a ballroom.

Two dancers in Thailand perform a traditional Thai dance.

Many cultures in Asia have a long history of formal, theatrical dance. In India the earliest book discussing dance is more than 1,500 years old. *Bharatanatyam* is a classical dance form based on this book. The dances of the Japanese royal court are called *bugaku*. They were adapted from traditional dances of China, Korea, India, and Southeast Asia. Dance is also an important feature of traditional forms of Japanese drama.

For the ancient Greeks dance was an important part of religious ceremonies as well as everyday life. Dances at festivals to honor a god developed into Greek drama in the 400s BC. Later in ancient Rome religious festivals also featured dances.

Middle Ages

In the Middle Ages (AD 500–1500) in Europe traveling acrobats danced to

entertain crowds. Some festivals on Christian feast days also featured dancing. But some Christian leaders of the time thought dancing was sinful.

Social dancing became important to the nobles of the Middle Ages. The upper classes learned to move gracefully in formal dances for couples. The peasants had their own dances. They usually sang and danced in large lively groups.

Renaissance

During a period in Europe called the Renaissance (mid-1300s to 1500s) dancing became an art, not just an entertainment. The royal courts began to stage festive pageants that combined dance, music, and drama. Professional dancers began performing ballet in theaters in the 1660s. From then on ballet was a form of theatrical dancing separate from social dancing.

Theatrical Dancing

Professional dancers and teachers developed a formal ballet technique. It was based on basic poses and steps. Ballet became extremely popular in France in the 1700s. In the 1800s the French dancer Marius Petipa went to Russia. He helped make that country the center of the ballet world. In the early 1900s the Russian arts promoter Sergey Diaghilev helped spread ballet through Europe and the Americas.

At the end of the 1800s the American dancer Isadora Duncan started what is now called modern dance. She felt that the set steps and poses of ballet limited her ability to express herself. She created

Did You Know?

Ballet dancers wear special shoes, but performers of modern dance often go barefoot.

Did You Know?

Most people enjoy social dancing for fun. Some people enter competitions in which they are judged for their ballroom dancing skills.

a new form of dance that was free-spirited and highly personal. Many other dancers developed their own styles of modern dance in the 1900s. One of the most influential was Martha Graham. Her company and school trained generations of important modern dancers. Her famous students included Twyla Tharp and Paul Taylor.

The American choreographer Agnes de Mille made dancing an important part of musical theater. Her production of the musical *Oklahoma!* in 1943 mixed ballet, folk, and modern dance. The dances Jerome Robbins created for *West Side Story* (1957) brought a new edge to musical theater. Robbins influenced later Broadway choreographers such as Bob Fosse and Michael Bennett.

Social Dancing

Once ballet became a professional form, the dancing done in the European royal courts was social dancing. Starting in the 1700s dances were held in ballrooms and houses. That way more people could participate.

Over the years, various dance forms went in and out of style. Some of the most popular were the minuet (1600s and 1700s) and waltz (1700s and 1800s). As music became less formal in the 1900s, so did social dances. Popular music—from big band to rock and roll and house music—has continued to inspire new forms of social dancing.

Dandelion

Dandelions are plants with bright yellow blossoms that turn into round, fluffy seed heads. Many people consider these wild plants to be weeds. The several species, or types, of dandelion belong to the same plant family as daisies and sunflowers.

Dandelions grew first in Europe and Asia. They are now widespread in North America. Dandelions survive the winter and regrow each spring.

Dandelions are small plants that often grow low to the ground. Green, jagged-edged leaves surround the base of a hollow stem. The central root, or tap root, can grow as deep as 5 feet (1.5 meters). In spring and summer, each plant produces a single flower head that is made up of many tiny yellow flowers.

After flowering, dandelions produce a head of thin, brownish seeds. Each seed is attached to a feathery structure. These seeds can scatter widely in the breeze.

Many people consider dandelion flowers to be pesky weeds.

Some people eat dandelion leaves in salads. People may also make the roots into a coffeelike drink.

Daoism

Daoism is a system of philosophy and religion that began in ancient China. It is sometimes spelled Taoism. Along with the philosophy called Confucianism, Daoism has helped to shape Chinese culture. Confucianism focuses on human society and the duties of its members. In contrast, Daoism emphasizes nature. It is more joyful and carefree.

Daoism began more than 2,000 years ago. It was based on a book called the *Daodejing* (or *Tao-te ching*). Laozi has traditionally been named as the author of the *Daodejing*. But scholars are not sure that Laozi ever existed. They now think that more than one person wrote the *Daodejing* between the 500s and the 200s BC.

For Daoists, the most important thing in life is to find the Dao. The Dao is not easy to define. It is the unchanging reality that is the source and end of everything. This means that all beings and things are one. Because all is one, life and death merge into each other. A Daoist does not fear death because it is only part of an eternal cycle.

“Dao” also is translated as “the Way,” meaning the way to think and act. Followers are taught to act in harmony with

Daoist worshippers make offerings in Hong Kong.

the natural course of things. They try to avoid disturbing the natural order. This often means that they take no action at all. Daoists believe that striving for power and wealth is a waste of energy. Such things distract people from searching for the Dao.

Dardanelles

The Dardanelles is a strait, or narrow body of water, that connects the Aegean

© 2008 Encyclopædia Britannica, Inc.

Sea and the Sea of Marmara in Turkey. It also separates the continent of Europe from the westernmost tip of Asia Minor. The strait is named for the ancient city of Dardanus. In ancient times it was called the Hellespont, meaning “Helle’s sea,” in memory of Helle, a mythical princess.

Another strait, called the Bosphorus, connects the Sea of Marmara with the Black Sea. Together the Bosphorus and the Dardanelles provide the only sea connection between the lands lying on the Black Sea and the rest of the world. The Gallipoli Peninsula lies along the western side of the strait. Major ports along its shores include Gallipoli, Eceabat, and Çanakkale, all in Turkey.

The Dardanelles came under Turkish control in 1453 and remained in Turkey’s hands until World War I. After the defeat of Turkey in 1917, the Dardanelles became part of a neutral zone under the control of the League of Nations. In 1923 the Treaty of Lausanne returned the region to Turkey.

Dar es Salaam

Population
(2002 census),
metropolitan
area,
2,336,055

Dar es Salaam serves as the capital of Tanzania, a country in East Africa.

Fishermen sell their catch at a fish market in Dar es Salaam, Tanzania.

Dodoma was named the new capital in 1974. But many of Tanzania’s government offices were still in Dar es Salaam in the early 21st century.

Dar es Salaam is much larger than any other city in Tanzania. The city lies on the Indian Ocean. It is Tanzania’s main port and center of manufacturing. It is also a popular tourist destination.

The sultan (king) of nearby Zanzibar founded Dar es Salaam in 1862. A German company took control of Dar es Salaam in 1887. It soon became the capital of the German colonies in East Africa. The city began to grow.

In World War I (1914–18) Germany lost its African colonies. Dar es Salaam became the capital of the new British territory of Tanganyika. The new country of Tanzania was formed in 1964. Dar es Salaam was its official capital until 1974.

Darwin, Charles

Charles Darwin

Charles Darwin was an English scientist who studied nature. He is known for his theory of evolution by natural selection. According to this theory, all living things are struggling to survive. The living things that have the most helpful traits for their environment tend to survive. These living things then pass along their helpful traits to their young. In this way, animals change, or evolve, over hundreds of years. He described his ideas in his important book, *On the Origin of Species by Means of Natural Selection* (1859).

Charles Robert Darwin was born on February 12, 1809, in Shropshire, England. He did poorly throughout school. Nevertheless he attended the University of Edinburgh and the University of Cambridge. A professor at Cambridge encouraged Charles's interest in natural history.

In 1831 Darwin joined an expedition to explore the coasts of South America. On December 27, 1831, Darwin and the others set sail on the HMS *Beagle*. Darwin's goal was to study the natural history of the areas they were to explore. The observations he made during the five-year trip led him to wonder how new species, or types, of plants and animals developed. To explain this process Darwin formed his theory of natural selection.

Darwin first presented his theory in 1858. The idea of evolution was not new then, but Darwin's theory explained how evolution occurred. When Darwin published *On the Origin of Species* in 1859, the book was an immediate success. However, it was not popular with people who believed that God created everything in the world all at one time. He continued writing about his theory in several other books. Charles Darwin died on April 19, 1882.

Date

Dates are small, sweet fruits that grow in large bunches on date palm trees. A single bunch may contain as many as 1,000 dates. Dried dates have a very high amount of sugar—at least half of their total weight.

Date palms can be found in hot, dry climates. They grow in North Africa, the Middle East, South Asia, and the southwestern United States. Egypt, Iraq, Iran,

Did You Know?

Although he is famous for writing about plants and animals, during his trip on the *Beagle* Darwin also studied the forces that build up mountains.

Dates ripen on a date palm tree.

and Saudi Arabia are the largest producers of dates.

Date palms grow to a towering height of about 75 feet (23 meters). Rough, overlapping stubs, or leaf bases, cover the surface of the tree trunk. These stubs, which point upward, are the remains of old leaves. A crown of shining leaves sprouts from the top of date palms. These leaves, or fronds, can be as long as 16 feet (5 meters).

The fruits are about 1 to 3 inches (2.5 to 7.5 centimeters) long. They are usually oval. When dates are ripe, their color ranges from golden brown to black. Dates contain one long, slender seed, called a stone.

Dates have been an important food for thousands of years, especially for people in the deserts of the Middle East. Dates

are an excellent source of energy and fiber. They also contain potassium and iron. The trunks and leaves of date palms may be used for fuel or to make furniture, baskets, or rope.

Davis, Jefferson

While Abraham Lincoln was president of the United States, Jefferson Davis was president of the Confederate States of America. The Confederate states were Southern states that decided they did not want to be part of the United States anymore. They disagreed with the other states about many things, especially slavery. Their disagreements led to the American Civil War.

Davis was born on June 3, 1808, in Kentucky. His parents were farmers who owned slaves. Jefferson grew up in Mississippi and graduated from the U.S. Military Academy at West Point in 1828.

Career in the United States

Davis served in the Army until 1835. He then returned to Mississippi and ran a plantation.

In 1845 Davis was elected to the U.S. House of Representatives. He left Congress in 1846 to command Mississippi troops in the Mexican War. He won a great victory at the battle of Buena Vista.

Jefferson Davis

Davis returned from the war as a hero and became a U.S. senator from Mississippi in 1847. From 1853 to 1857 he served as secretary of war under President Franklin Pierce. Davis again became a senator in 1857. At the time, Northerners and Southerners were arguing about many issues. Davis tried to get the two sides to work together, but they became more and more divided.

The Confederacy

In January 1861 Mississippi seceded, or left the Union. Several other states did the same. Representatives of those states chose Davis to be their president. He took office on February 18, 1861. Davis ordered an attack on Fort Sumter in South Carolina on April 12. The attack began the American Civil War.

As president, Davis had a hard job. The United States had more people and

more resources than the Confederacy. After four years of fighting, the Confederate troops were forced to surrender. This brought an end to the Confederate States of America.

Davis then left Richmond, Virginia, which was the Confederate capital. On May 10 he was captured in Georgia. He was put into prison for disloyalty to the United States. But he was not placed on trial. After two years he was released.

Davis spent time in Canada and Europe and then ran an insurance company in Memphis, Tennessee. He died in New Orleans, Louisiana, on December 6, 1889.

Dead Sea

The Dead Sea is actually a salt lake. It is located in southwestern Asia between Jordan on the east and Israel and the West Bank on the west. The Dead Sea

The salt from the Dead Sea collects on its shores.

has so much salt in it that only microbes (microscopic life-forms) are able to live in it. Its salt content is about seven times that of the ocean.

The Dead Sea is about 50 miles (80 kilometers) long and 10 miles (16 kilometers) wide. Its surface is 1,312 feet (400 meters) below sea level, making it the lowest body of water on Earth. Its greatest depth is in the north, where it is about 1,309 feet (399 meters) deep. The Jordan River flows into the Dead Sea from the north.

The land surrounding the Dead Sea is a desert. The hot summer temperatures cause the lake's water to evaporate at a high rate. When the water evaporates it leaves behind salt. The area gets very little rain so the water that evaporates is not replaced very quickly. Because of that, a high concentration of salt has built up in the Dead Sea over the years.

In addition to the huge amount of salt in the Dead Sea, there are also large reserves of potash, gypsum, and other chemical substances. The salt has been

used since ancient times. In the 1900s nearby factories began collecting potash, magnesium, calcium chloride, bromine, and other chemicals from the sea.

Dead Sea Scrolls

In 1947 a young shepherd found some ancient scrolls (rolled-up writings) in a cave in Jordan. More scrolls were found nearby soon afterward. Now they are all known as the Dead Sea Scrolls because they were found near the Dead Sea. They are important because some of the scrolls contain parts of one of the earliest versions of the Hebrew Bible. Others are writings of the Jewish people who lived in the area more than 2,000 years ago.

The Dead Sea Scrolls are written on such materials as leather, papyrus (made from the stems of a plant), and copper. After being rolled up for so long they were dried out and would not unroll without breaking into pieces. Scholars spent years working out ways to unroll them without destroying them. Most of

A piece of the Dead Sea Scrolls shows an early form of Hebrew writing.

the scrolls and fragments are now overseen by the government of Israel.

The Bible scrolls were copies of original manuscripts. They have been useful in understanding the history of the Hebrew Bible. Other scrolls outline the rules of a community of Jews who lived on the shores of the Dead Sea from about 150 BC to AD 68. Many scholars believe that this was a group called the Essenes. Some believe that the scrolls themselves were the property of the Essenes.

Deafness

A teacher uses sign language to communicate with deaf students.

A person who is deaf either has trouble hearing or cannot hear at all. Deafness can occur in one ear or in both ears. It is called partial deafness if the person can still hear a little. It is called total deafness if a person cannot hear anything.

Causes

There are a number of reasons why people are deaf. Parents can pass down

genes that cause deafness. Diseases and head injuries can result in deafness. Ear infections can cause temporary deafness. Too much earwax can also cause temporary deafness. In some cases people lose hearing because of listening to loud noise. People often lose some hearing as they get older, too.

Prevention and Treatment

Sometimes deafness cannot be prevented or treated. This is the case when deafness is caused by genes or by old age. However, vaccines can prevent certain diseases that might damage the ears. People who work in noisy places can wear earplugs. Hearing aids help people who are partially deaf. They make sounds louder.

In some cases a doctor can perform surgery. An example would be when an ear passage is blocked. If nerves are damaged, a doctor might put a cochlear implant under the skin near the ear. This device changes sounds into electrical signals. The person then learns to recognize those signals as sounds.

Deaf people can still communicate. They can read lips. Some use their hands to make signs for letters, words, and ideas. This is known as sign language. They can also learn to speak. Many are helped by speech therapy.

Deaf people can use the telephone by typing on a special keyboard. They can also understand television shows through the closed-captioning system. This system translates the spoken words

Death

Death marks the end of life. When a living thing dies, its body stops working. All living things, including plants and animals, go through the process of death.

How Death Happens

In humans death can happen in many different ways. Most people die from diseases related to aging. Cancer, heart disease, and other illnesses may cause death. Some people die in accidents or as a result of violence or natural disasters. In some parts of the world people die from warfare, starvation, or poor nutrition.

Cemeteries are final resting places for the dead. Many members of the military and other notable Americans are buried in Arlington National Cemetery, near Washington, D.C.

A person dies when the body's most important organs—the heart, the lungs, and the brain—stop working. Once these organs fail, other organs also stop working. Individual cells can survive longer, but eventually they also die.

People used to be considered dead when they stopped breathing and their heart stopped. Today, however, special medical techniques and equipment can restart the heart and lungs. Many people now consider brain death to be the end of human life. Brain death happens when the brain shows no signs of any activity, even if machines are keeping the heart and lungs working.

Dealing with Death

Every culture has its own customs for dealing with death. Most of these customs include either burial or cremation (burning) of the body. In addition, people often gather at funerals or other services to honor the person who died.

Many people believe that, once the body dies, a person's mind or soul continues in some kind of afterlife. Others think that the body's death is the end of that person. People have always been interested in what happens after death, but no one knows for certain.

Death Valley

Death Valley is the lowest, hottest, and driest point in North America. It got its

name because of the hardships faced by settlers attempting to cross the valley.

Death Valley is located in southeastern California, in the United States. The valley is about 140 miles (225 kilometers) long and 4 to 16 miles (6 to 26 kilometers) wide. The lowest point in the valley lies 282 feet (86 meters) below sea level. Not far away towers Mount Whitney, the highest point in the continental United States. It is 14,494 feet (4,418 meters) above sea level.

Summer daytime temperatures in the valley often reach 120° F (50° C) in the shade. Winter temperatures rarely fall to freezing. The average annual rainfall is only about 2 inches (50 millimeters).

Despite the extreme conditions, Death Valley is home to a variety of plants and animals. The plants include saltgrass, cacti, and desert wildflowers. Animals include lizards, rabbits, kangaroo rats, coyotes, and bobcats. The largest animal is the desert bighorn sheep.

For many years Death Valley was little known except to the Panamint Indians who lived in the area before the Europeans came. Few people visited the area until the 1870s. At that time, gold was discovered in the surrounding mountains. Death Valley's extreme environment now attracts tourists and scientists. It was made a national park in 1994.

Declaration of Independence

The Declaration of Independence is the founding document of the United States. On July 4, 1776, the Continental Congress of the British colonies in North America adopted the declaration at Independence Hall in Philadelphia. The document proclaimed that the 13 original colonies of America were “free and independent states.” It was the last of a series of steps that led

Dead trees are scattered among sand dunes in Death Valley.

Many important people in the early history of the United States signed the Declaration of Independence. Famous signers include Benjamin Franklin, Thomas Jefferson, and Samuel Adams.

the colonies to final separation from Great Britain.

At the time the American Revolution began with Great Britain in April 1775 most colonists were not seeking independence. They simply wanted the British government to listen to their complaints. But as the war continued, many colonists began to favor freedom from British rule.

New reasons for independence from Great Britain appeared regularly. In August 1775 King George III declared that the colonists were rebels and hired foreign troops to fight them. The British attacked the coast of Maine and did great damage in Virginia. In January 1776 Thomas Paine published the pam-

phlet *Common Sense*. It pointed out how the colonists were being mistreated by the king. Many copies of the pamphlet were sold, and support for independence grew.

On June 7 Richard Henry Lee, a Virginian, asked the Continental Congress to consider declaring independence from Great Britain. The congress appointed a committee of five to write the formal declaration. Thomas Jefferson wrote the first draft. A few changes were suggested by other members of the committee: John Adams, Benjamin Franklin, Roger Sherman, and Robert R. Livingston.

On July 2, 1776, the congress accepted the idea of independence. It then debated the content of the declaration over the next two days. On July 4 the Declaration of Independence was accepted by the representatives of 12 states. The New York delegation accepted it 11 days later. It was first published in newspapers and read aloud to crowds in towns throughout the colonies. Members of the congress signed the official parchment document on August 2. The document first lists the complaints against the English king and then makes the actual declaration.

Decorative Arts

Decorative art is the art of making useful things beautiful. The decorative

Glassmaking is a type of decorative art. The U.S. designer Louis Comfort Tiffany made many beautiful glass vases.

arts include pottery making, jewelry making, weaving, woodworking, and other crafts. Different cultures around the world have their own forms of decorative art.

For most of history people made decorative art by hand. In North America, Native Americans made painted pottery and delicate baskets. In the American colonies Paul Revere was well known for creating beautiful silver objects. He made silver utensils, bowls, plates, and candleholders.

In Europe and early America a young woman's education usually included decorative arts. Girls learned these skills both at school and at home. They learned embroidery and quilt design. They painted flowers and landscapes on tabletops and other household objects.

In the 1800s people began using machines to make decorative art. Factories made pottery, furniture, lamps, and rugs from designs created by artists. The factories turned out thousands of decorative objects from each design.

Arts and Crafts Movement

However, some decorative artists still wanted to create one-of-a-kind objects. Many of these artists joined a movement called the Arts and Crafts Movement. Arts and Crafts artists made stained glass windows and lamps by hand. They also made furniture and other kinds of beautiful, useful objects.

Later Developments

In the early 1900s a famous school for design opened in Germany. This school was called the Bauhaus. Artists there designed furniture and other objects for the home. They wanted everyday objects to be both useful and artistic. Bauhaus artists believed that the good design of useful things, such as forks and teapots, could improve people's lives.

People in Mexico weave blankets in colorful, traditional patterns. This type of blanket is both useful and decorative.

One of the leading designers of the Arts and Crafts Movement was William Morris. His designs for wallpaper often featured flowers or leaves in complex patterns.

Decorative art is still very popular today. Many weavers, jewelers, woodworkers, potters, and other decorative artists sell their work at art shows, in art galleries, or in shops. Many people who are not artists also enjoy making decorative objects. They learn how to create decorative art from books, magazines, and home decorating shows on television. Some people also take classes or attend special workshops.

Deer

Deer are the only animals that can grow large antlers. They are hoofed mammals that belong to the scientific family Cervidae. There are about 30 different species, or kinds, of deer. Among them are the white-tailed deer, the mule deer, the moose, the wapiti, and the reindeer, or caribou.

Where Deer Live

Deer are native to Europe, Asia, North America, South America, and northern Africa. People have brought them to Australia, New Zealand, and other areas. Deer live in a wide variety of places, including forests, swamps, deserts, and tundras.

Physical Features

Deer have large ears, short tails, and long, slender legs. On each foot they have two small and two large hooves. Deer usually have smooth, brown fur. White areas often cover the chest and throat. Some types have a shaggy coat, especially in the cold seasons.

The smallest deer, the South American pudu, is about 12 inches (30 centimeters) tall at the shoulder. The largest deer, the moose, may be more than 7 feet (2.1 meters) tall at the shoulder. Females are usually smaller than males.

White-tailed deer live in open wooded areas. As with most deer, only the males grow antlers.

The males of most species grow antlers, which are bony growths on the head. Female reindeer also grow antlers. Male deer use their antlers to fight other males for a chance to mate with females. Deer shed their antlers and grow a new set each year.

Behavior

Deer eat only plant material—for example, grass, twigs, and bark. They chew their food, swallow it, and then bring it back up from the stomach in a form called cud. After chewing the cud, they swallow it again.

Most deer live in small family groups, though the males generally spend some time alone. In warm climates deer mate at any time of the year. In colder climates they breed in autumn or winter. Female deer usually give birth to one or two young. Most deer reach adulthood in one to three years.

Deer and Humans

Since ancient times, people have hunted deer for their meat (called venison), hides, and antlers. Hunting deer is still a popular pastime in the United States and many other places. People also use hunting to control the number of certain types of deer.

In many parts of the world, some types of deer are endangered, or at risk of disappearing. Possible causes include too much hunting and the clearing of the land where the deer lived.

Deere, John

John Deere invented the first successful steel plow. His invention helped make the midwestern United States one of the world's great farming regions. The company he started, Deere & Company, became a leading maker of farm equipment.

Deere was born in Rutland, Vermont, on February 7, 1804. As a teenager he worked in a blacksmith's shop. At age 21 he set up his own shop. Many of his customers were farmers.

In 1836 Deere moved to Illinois. The farmers of Illinois had a troublesome problem. The soil was very good for growing crops, but it was also very hard to plow. It was so thick that it stuck to their plows, which had blades made of cast iron. Deere designed new plows with blades of polished steel. The steel plows worked well because the soil did not stick to the blades.

Soon Deere began making plows in large quantities. In 1847 he moved his factory to Moline, Illinois, and expanded it. By 1857 he was producing 10,000 plows a

A farmer stood behind John Deere's steel plow and used the two handles to guide its path.

year. In 1868 Deere's business became known as Deere & Company. Today Deere & Company makes all kinds of farm machinery.

Late in life Deere registered some of his ideas with the U.S. government as patents. He also served for several years as mayor of Moline. He died there on May 17, 1886.

De Gaulle, Charles

A military leader and statesman, Charles de Gaulle led France through several difficult periods. In 1959 he became president under a new constitution that he helped write. Throughout his career De Gaulle was guided by his belief in the greatness of France.

Charles de Gaulle

Early Life

Charles de Gaulle was born on November 22, 1890, in Lille, in northern France. He became interested in the military as a boy and graduated from the Military Academy of Saint-Cyr in 1911.

Career

De Gaulle fought in World War I (1914–18). After the war he taught military history at Saint-Cyr. He served on a military mission to Poland and also wrote several books on military subjects. When Germany occupied France at the beginning of World War II (1939–45), De Gaulle took control of the Free French resistance movement. He led the movement from England.

De Gaulle returned to Paris as a national hero in 1944 after the Germans had retreated. He became active in politics as the country tried to deal with many problems. One problem was a civil war that broke out in Algeria, which was a French colony at the time. De Gaulle finally became president of France in 1959.

After he became president, De Gaulle promoted peace negotiations in Algeria. He declared Algeria's independence on July 3, 1962. De Gaulle also increased his efforts to make France a leading world power. At his urging the French developed nuclear weapons and a space program.

Last Years

In 1968 the French government faced a students' and workers' revolt. On April

27, 1969, the people of France voted down De Gaulle's proposals for constitutional changes. The following day De Gaulle resigned. He retired to his home at Colombey-les-Deux-Églises, where he died on November 9, 1970.

Delaware

The Native Americans known as the Delaware call themselves the Lenape (meaning “real people”). They are also often called the Lenni Lenape. English settlers named them the Delaware because they lived in villages along the Delaware River.

The Delaware originally lived in a huge territory that included what are now New Jersey, Pennsylvania, New York,

and Delaware. Delaware men fished and hunted deer, elk, bear, and beaver.

Women planted fields of corn, beans, squash, and other crops. The women also made clothing, baskets, and pottery.

The Delaware built dome-shaped houses called wigwams that they covered with tree bark. They also built large structures made of wood and bark called longhouses. Each autumn, people gathered at the longhouses for a 12-day ceremony. During the Big House ritual, the Delaware thanked their creator for their latest harvest. The Big House ceremony was performed until the 1900s.

In the early 1600s settlers from England, Sweden, and the Netherlands began arriving in Delaware territory. They brought with them diseases, such as smallpox and measles, that killed many tribe members.

Europeans also forced the Delaware to give up much of their land. After the colonists' victory in the American Revolution (1775–83), many Delaware moved to Ontario, Canada. The Delaware who stayed in the United States moved west. In the mid-1800s the government forced them to move to Indian Territory (now Oklahoma).

By the end of the 20th century, there were about 10,000 Delaware. Most live in Oklahoma, Wisconsin, and Ontario, Canada.

Tishcohan was a chief of the Delaware.

Delaware

In 1610 Englishman Samuel Argall sailed into a large bay along the Atlantic Coast of North America. He called it Delaware Bay in honor of Virginia's colonial governor Sir Thomas West, baron De la Warr (or Delaware). The name was later given to the nearby river and to the colony that became the state of Delaware. Delaware is nicknamed the First State because it was the first colony to ratify, or vote in favor of, the United States Constitution. Dover is the capital.

Geography

Delaware is a Middle Atlantic state located on the East Coast of the United States. Delaware is bordered on the southeast by the Atlantic Ocean. The Delaware River and Delaware Bay sepa-

rate it in the northeast from New Jersey. To the north is Pennsylvania. To the south and west is Maryland.

Most of Delaware is a flat coastal plain. It is seldom more than 60 feet (18 meters) above sea level, and it becomes increasingly sandy to the south. There are many woodlands, streams, and fresh-water ponds in the region. The far northern part of the state is more elevated and runs into the foothills of Pennsylvania.

People

More than 70 percent of Delaware's population are whites of European descent. African Americans make up about 19 percent of the state's population. Hispanics represent 5 percent of the population and Asian Americans 2 percent. Although Delaware's total population is less than 1 million people, it is one of the nation's most densely populated states. This means that there are many people living in a small area. Delaware's largest city, Wilmington, has a population of more than 72,000 people.

Economy

Delaware has been called the Chemical Capital of the World. This is mostly because of the DuPont Company's long connection with the state. One of DuPont's many inventions in the field of chemistry was the artificial fiber known as nylon. DuPont and Hercules, another large chemical firm in Delaware,

Visitors to Delaware's Rehoboth Beach enjoy the sun, sand, and ocean.

create products used in such things as fabrics, paper, pigments, and plastics. Credit card businesses also have operations in the state. Broiler chickens (raised for meat) are the major agricultural product.

History

The Delaware area was the home of the Delaware (or Lenni Lenape) and several other Native American tribes before Europeans began to settle the area in the early 1600s. Dutch settlers arrived in the area in 1631. They called their new home Zwaanendael, meaning “valley of the swans.”

The next European settlement was made by Swedish colonists in 1638 under the leadership of Peter Minuit. They built their homes on the site of what is now Wilmington, on the Christina River. The first permanent settlement was called Fort Christina. In 1682 the Delaware colony became part of Pennsylvania. Disagreements led the colony to

form its own legislature in 1704, but the area remained under the control of Pennsylvania's governor until 1776.

In 1776 Delaware played an important role in the passage of the Declaration of Independence. Caesar Rodney was one of Delaware's three delegates to the Continental Congress. When the two other delegates split their vote over whether to support the declaration, Rodney rode on horseback from Dover to Philadelphia in order to break the tie. His last-minute ride allowed him to cast Delaware's deciding vote for independence.

Although many Delaware residents owned slaves, the state remained with the Union when the American Civil War began in 1861. After the war, with much help from the Du Pont family, the state prospered.

Delhi was the capital of mighty empires in South Asia for hundreds of years.

Today it is divided into two cities—Delhi (or Old Delhi) and New Delhi. New Delhi is the capital of the country of India. Both cities are part of an area known as the national capital territory of Delhi.

Old Delhi grew over hundreds of years. It has narrow, winding streets and busy markets. Its living areas are crowded. Old Delhi also has many historic build-

ings. The beautiful Red Fort was built there in the 1600s.

New Delhi was built in the early 1900s. A British architect designed the city. It has wide, straight streets and many parks.

Many people in Delhi work in government, education, health care, and tourism. Delhi has long been northern India's leading center of business and trade. Factories in Delhi make cloth, electronics, tools, and other products.

Many different cities were built in the Delhi area over the years. It was the capital of a series of Muslim rulers beginning in the 1100s.

In the 1700s Great Britain began taking over parts of India. The British captured Delhi in 1803. They began building New Delhi in 1912. It became the capital of British India. In 1947 India became an independent country with New Delhi as its capital.

Delphi

Delphi was a town in ancient Greece. It was the home of the most important Greek oracle. The ancient Greeks asked their gods for answers to their questions and problems. An oracle was both the god's answer and the temple where people came to receive such answers.

The Greeks considered Delphi to be the center of the world. Over many years,

Visitors to Delphi today can see the ruins of one of the temples of Apollo.

several temples were built there to honor Apollo. He was the god of light, poetry and music, and prophecy, or the telling of the future.

People came from every part of Greece to learn their future through Apollo. The oracle was even consulted before any new colony was formed. People would often bring expensive gifts. Priestesses and priests would deliver the oracles to the people. The oracles were worded so that they could have two or more different meanings.

The oracle was closed in the AD 300s. Today Delphi is a popular tourist destination and a major archaeological site. Excavations have uncovered temple ruins and pieces of sculptures.

Delta

In ancient times Greek merchants who sailed to Egypt noticed that the Nile River branched into two streams before flowing into the sea. The sea and the river's branches enclosed a piece of land shaped like a triangle. The Greeks called that land a delta because it resembled the fourth letter of the Greek alphabet (Δ). Now the term delta is used for any plain made up of material deposited by a river at its mouth.

Rivers often carry a lot of soil, sand, and other material. When the flow of a river slows at its mouth, some of that material settles. Over the years the material builds up to form a delta. The surface of a delta is almost level, and the river usually flows across it in a number of small branches.

Deltas have been important to people since prehistoric times. The soil of a delta is usually ideal for farming. Major civilizations developed in the deltas of

Demeter

In ancient Greek mythology Demeter was the goddess of grain and farming. She was associated with the Roman goddess Ceres because they shared many characteristics. Demeter's symbols included corn and a basket filled with grain, flowers, and fruit.

Demeter was the daughter of Cronos and Rhea, who were Titans. The Titans were giants who once ruled the world. Demeter was said to watch over all aspects of farming, including plowing, planting, and harvesting. In ancient Greece the women typically did these jobs. So Greek women often worshipped Demeter.

Did You Know?

Certain grass seeds that are good to eat are called cereals in honor of Ceres.

The ancient Greeks used a story about Demeter to explain the changing of the seasons. Demeter's daughter was the beautiful Persephone. Hades, the god of the underworld, seized Persephone. He took her to the land of the dead to be his queen. Demeter was overcome with grief. In her great sadness she did not care about helping the harvest. As a result, no crops on Earth could grow.

Zeus, the chief god, ordered Hades to give up Persephone. But in the underworld Persephone had eaten the seed of

a fruit called a pomegranate. Because of this, she would always be connected to the land of the dead. For part of each year she would have to return to Hades. When Persephone was gone, Demeter refused to let anything grow. Winter then fell over Earth. But when Per-

sephone returned, Demeter made all the plants bloom in celebration. It was then spring.

Hades • Mythology

Democracy

The word democracy describes a form of government. The word comes from two Greek words that mean “rule by the people.” In a democracy the people have a say in how the government is run.

They do this by voting, though there are usually rules about who can vote.

Democracies are different from dictatorships. In a dictatorship one person called a dictator makes all the rules.

Types of Democracy

There are two main forms of democracy. In a direct democracy all the voters come together in one place to make laws and decisions. Often there are too many people for a direct democracy to work. In those cases the people elect representatives, or other people to speak for them. This is called a representative democracy. The elected representatives make the laws and decisions.

History

The first democracies were in ancient Greece more than 2,000 years ago. Those did not last long, however. After that, kings and other rulers had all the power in their countries. In about the 1200s, however, some rulers began to allow certain citizens to be part of the government.

People line up to vote in Sierra Leone, a country in Africa.

By the 1600s and 1700s some people began to think that all people had certain rights. These included the right to participate in their government. In the British colonies of North America the colonists felt that the king did not allow them to participate enough. They fought a war to gain their freedom. When they won the war they established the United States as a republic.

A republic is a form of democracy in which the citizens vote for the people who make the laws. They also vote for the leader of the country, who is often a president. Many other countries became republics as well. Other countries kept their kings or queens but still became democracies. Monarchies with democracy are called constitutional monarchies. In such countries the people vote for representatives. The king or queen is the head of the country, but they have little real power.

Government • Voting

Denmark

The Kingdom of Denmark is the southernmost of the countries that form the region known as Scandinavia. Scandinavia also includes Sweden and Norway. Although small in territory and population, Denmark has played a notable role in European history. The capital is Copenhagen.

Geography

A long peninsula known as Jutland makes up most of the country's area. Denmark also includes more than 400 islands to the east of Jutland. Germany lies to the south of the peninsula. The North and Baltic seas surround the rest of Denmark. Narrow passages of water, called straits, separate Denmark from Norway and Sweden. Greenland and the Faroe (or Faeroe) Islands, both located in the North Atlantic Ocean, are self-governing parts of Denmark.

The Faroe Islands of Denmark are home to Atlantic puffins and other sea birds.

The Jutland Peninsula is a lowland region with farmland in the east. The longest river in Denmark, the Gudenå, flows for 98 miles (158 kilometers) through Jutland. The islands have low hills, small lakes, and sandy beaches. Fewer than one quarter of the islands are populated. The climate is generally moist and mild.

Plants and Animals

Much of Denmark was once covered by forests of oak, elm, lime (linden), and beech trees. These original forests were cleared to create farmland, but some areas have been replanted. Wildlife includes deer, hares, and hedgehogs. More than 300 species, or types, of bird live in Denmark. However, though the once-common stork is now rare. Fish are plentiful in Danish waters.

People

Most of the people of Denmark are ethnic Danes. Minority groups include people from Turkey, Iran, and Pakistan. Danish, the official language, is closely related to Norwegian. English is also widely spoken. Most of the people belong to the Lutheran church. About 85 percent of the population lives in cities and towns. Copenhagen is home to about one quarter of the country's people.

Economy

Denmark's economy is based largely on services (for example, banking, education, and health care) and manufacturing. The leading manufactured products are machinery, processed foods, metals, printed material, plastic and rubber goods, and furniture. Tourism is important as well.

Denmark has few natural resources. The soil is the country's most important raw material, as about 60 percent of the land is suitable for farming. Wheat and barley are the main crops, and pigs are the main livestock. Denmark's harbors support a large fishing industry.

History

People have lived in Denmark since prehistoric times. The Danish kingdom dates back to the Viking Age, which lasted from the 800s to the 1000s. The Vikings were Danish, Norwegian, and Swedish warriors who invaded much of Europe. By the 1000s the Danish kingdom had grown to include parts of what

Boats anchor in the harbor at Copenhagen, Denmark.

are now Germany, Sweden, Norway, and England.

In 1397 Denmark united all of Scandinavia, plus Iceland, under its rule. After a series of wars, Sweden left the union in 1523. The union between Denmark and Norway lasted until 1814, when Denmark was forced to turn over Norway to Sweden.

Nazi Germany occupied Denmark during World War II. In 1945 Denmark recognized the independence of Iceland. It granted the Faroe Islands self-government in 1948. Greenland became part of Denmark in 1953. It gained self-government in 1979.

Denmark joined the European Economic Community (now the European Union) in 1973. In 2000, however, the nation voted against adopting the euro—the monetary unit of the European Union—as its currency.

Dentistry

The work of dentists is called dentistry. Dentists are doctors who prevent and treat diseases of the teeth and gums.

Preventing Tooth Decay

Tooth decay is the most common problem with teeth. A sticky film called plaque causes tooth decay. Bacteria in the mouth form plaque as they feed on sugars from food. As acids in the plaque eat away the outer layer of the teeth, decayed areas called cavities form.

Brushing and flossing the teeth can prevent tooth decay. But regular cleanings at a dentist's office are also important. During a cleaning the dentist, or an assistant called a dental hygienist, removes tartar and other material from the teeth. Tartar is a hard, yellowish substance that forms from plaque, minerals, and saliva. The hygienist also polishes the teeth, which helps to prevent plaque from building up again. The hygienist may also treat the teeth with sodium fluoride, a mineral that helps to keep cavities from forming.

A dentist drills a patient's tooth.

Dental Treatments

After a cleaning or on a separate visit, the dentist inspects the teeth and gums for problems. An assistant will often take X-rays, which show cavities or problems inside the teeth or below the gums.

The dentist uses a drill to remove any cavities. Drugs help the patient not to feel pain during the drilling. Then the dentist fills the tooth with a substance made of metals, plastics, or other materials. The substance is commonly called a filling.

Dentists try to avoid pulling teeth. Sometimes, though, dentists must remove teeth that cause pain or other problems. If a patient loses teeth, the dentist may fit the patient with false teeth. Some false teeth are attached to the jawbone. Others, called dentures, may be taken out at night for cleaning.

Dentists may also treat other problems with the teeth, gum disease, and problems with the jaw. Some dentists, called orthodontists, straighten teeth. Cosmetic dentists work to make teeth even and white.

History

In ancient times people used herbs, mouthwashes, magic spells, and prayers to treat tooth problems. They also pulled out decayed teeth. Dentistry became more scientific in the 1700s. Dentists began using drugs and X-rays in the 1800s. In the 1900s people began adding sodium fluoride to toothpastes

and drinking water to help prevent tooth decay.

Denver

Denver is the capital of the U.S. state of Colorado. It is a center of transportation, industry, and culture.

Denver is known as the Mile High City. This is because it sits about 1 mile (1.6 kilometers) above sea level. The city lies just east of the Rocky Mountains. Many people visit Denver to ski and hike in the mountains.

Many people in Denver work in tourism, health care, banking, and high-technology industries. Some factories in the city make electronics and equipment for space travel. A U.S. government factory in Denver makes coins.

Denver developed as a mining town. Gold was discovered in Colorado in 1858. People looking for gold settled the site of Denver. It became the capital of the Colorado Territory in 1867. Colorado became a U.S. state in 1876. Denver was then made the state capital.

The Civic Center is a government building in downtown Denver, Colorado. The Rocky Mountains lie to the west of the city.

The people of Denver built their own railroad line in 1870. It connected Denver to a major rail line that crossed the United States. The city grew as a result. In the late 1800s more people moved to Denver. They came to work in the area's silver mines. The city continued to grow greatly during the 1900s.

Colorado • Gold Rush

Desert

When people think of a desert, they usually think of a sandy, hot, and dry place. But there are other types of deserts as well. A desert is any large region that gets very little rain each year. Very few plants or animals live in desert areas.

Features

Deserts cover about 20 percent of Earth's land surface. All the continents

Most deserts get less than 10 inches (25 centimeters) of rain in a year.

have them. Deserts differ greatly in their land features. They may include dunes of shifting sand, mountains, bare rock, and plains of gravel and boulders. Sand dunes are not as common in deserts as many people think. For example, they make up only about 10 percent of the Sahara of northern Africa. Some deserts are not sandy at all.

Types of Deserts

Deserts may be hot or cold. In hot deserts daytime temperatures are often above 100° F (38° C) in summer. The temperature drops sharply at night. The Sahara is the world's largest hot desert. Other hot deserts include the Kalahari in southern Africa and those in the southwestern United States. Most hot deserts are in the region known as the tropics. This is a band of Earth on either side of the equator.

Cold deserts are farther from the equator than hot deserts. Though they are very dry, the main reason they have few plants is that it is so cold there. A cold

desert covers much of Antarctica. The Gobi in Mongolia is another cold desert.

Life in a Desert

Desert plants and animals have features that help them survive in the dry climate. Some plants have special roots that help them absorb the small amount of water that is available. Cacti and yuccas are common desert plants. Desert animals include camels, gazelles, snakes, lizards, and small rodents.

Few people live in deserts. Groups who do include the Tuareg of the Sahara, the San of the Kalahari, the Bedouins of the Middle East and North Africa, and the Aborigines of Australia. Many desert dwellers live in oases. An oasis is a place in the desert with a supply of freshwater.

tant industries. Many people in Des Moines work for the state government.

Before Des Moines was founded, Sauk and Fox Indians lived in the area. In 1843 the U.S. government built Fort Des Moines at the site. A town soon grew around the fort.

In 1857 the Iowa state capital was moved from Iowa City to Des Moines. The city grew rapidly in the early 1900s. In 1993 the Des Moines and Raccoon rivers overflowed their banks. Much of the city was flooded.

De Soto, Hernando

Hernando de Soto was a Spanish soldier and explorer. He grew rich as a trader and conqueror in Central America and Peru. He died, however, while looking for more treasure in North America.

Hernando de Soto was born in Spain in about 1496. In 1514 he traveled to the West Indies and Central America. He

grew wealthy as a trader of Indian slaves. In 1532 he went to South America. There he helped conquer the wealthy Inca Empire of Peru. De Soto returned to Spain in 1536, rich with Inca treasure.

In 1537 the king of Spain sent De Soto to North America. The king wanted De Soto to conquer the land that is now Florida. He arrived in May 1539 and traveled through what is now the southeastern United States. He treated the Native Americans cruelly, trying to force them to lead him to gold. In response, the Native Americans frequently attacked the Spaniards.

Hernando de Soto

In 1541 De Soto and his men crossed the Mississippi River. They were the first Europeans to see it. De Soto died of disease on May 21, 1542, in what is now Louisiana. His men returned to Spain without gold.

Inca • Mississippi River

Dew

At dawn, tiny drops of water often cling to grass and other plants. This moisture is called dew. Dew forms in the night air through a process called condensation.

Air contains water in the form of a gas called water vapor. In the evenings, when warm, moist air passes over cool surfaces, the air cools down. The water vapor in the air begins to condense, or form into small drops. The drops cling to cool surfaces such as leaves, flower petals, and grass. The temperature at which this condensation begins to happen is known as the dew point.

Dew usually forms on clear nights when the air is calm. Dew can form on any surface that is cool and exposed to the sky. It often forms on the ground and on plants because these things usually cool faster than the air. For the same reason, dew often collects on the tops of cars. The time of night when dew begins to form is called dewfall.

Dew often forms on grass during cool nights.

Dew can help plants if they are dry. But damaging fungi may form on plants if dew makes them too wet. Dew that contains pollution is another danger. Pollution can get into dew when the water vapor in polluted air condenses. Like acid rain, this polluted dew, called acid dew, can harm living things.

Diabetes

Two different diseases are called diabetes. Diabetes mellitus happens when there is too much glucose in the body. Glucose is a sugar that the body gets from food and uses for energy. Diabetes insipidus is a rare disease that affects the kidneys.

Types of Diabetes

There are two major types of diabetes mellitus. In type I the body stops making insulin or does not make enough. Insulin is a hormone, or chemical, that normally controls the level of glucose in the blood. This type of diabetes often happens in children and teenagers. In type II the body makes insulin but cannot use it properly. Type II usually occurs in adults. It is the most common type of diabetes.

Diabetes insipidus is linked to a hormone called vasopressin. When the body

A woman with diabetes gives herself a shot of insulin.

does not make vasopressin or cannot use it, the kidneys produce too much urine.

Symptoms

Diabetes mellitus and diabetes insipidus have similar symptoms. People with either disease are often very thirsty. They also urinate a lot. The loss of water through urination can cause dry skin and tiredness. Untreated diabetes mellitus can lead to heart disease, kidney problems, blindness, the loss of feet or legs, and death. Untreated diabetes insipidus can lead to low blood pressure and shock.

Did You Know?

Before doctors began to give insulin to people with diabetes mellitus in the 1920s, many people died soon after developing the disease.

Causes

Doctors do not know the exact cause of diabetes mellitus. People who are overweight and do not exercise seem to have an increased risk of developing the disease. Diabetes insipidus may be caused by brain damage, kidney damage, or certain drugs.

Treatment

People with type I diabetes mellitus must have daily shots of insulin. People with type II can usually control the disease with a healthy diet and weight loss. In some cases, however, medication is needed. Doctors treat diabetes insipidus with medications.

Dias, Bartolomeu

Bartolomeu Dias

Bartolomeu Dias of Portugal was one of the most important European explorers before Christopher Columbus. He led the first European expedition around the southern tip of Africa. This opened the way for sea trade between Europe and Asia.

Bartolomeu Dias (also spelled Bartholomew Diaz) was born in about 1450 near Lisbon, Portugal. In August 1487 Dias took three ships in search of the southern tip of Africa. In January 1488 he passed the tip, but he did not see it. It was very stormy at the time. After he turned around and reached the southern coast of Africa he realized what had happened.

Dias wanted to go on to India, but his crew would go no farther. Upon rounding the tip of Africa again, Dias named it the Cape of Storms because of the weather he had battled on the voyage

out. It was later renamed the Cape of Good Hope. Dias returned to Portugal in December 1488. In 1497 another Portuguese explorer, Vasco da Gama, continued along the same route and reached India.

In 1500 Dias commanded a ship in an expedition led by Pedro Álvares Cabral. Cabral's fleet veered far from Africa and sighted land that turned out to be Brazil. Dias died at the Cape of Good Hope in May 1500, when his ship sank in a storm.

Dickens, Charles

Charles Dickens was one of the most famous English writers of the 1800s. Although his books are often very funny,

Charles Dickens

they show many of the difficulties of living in his time. His books are still very popular today.

Charles Dickens was born on February 7, 1812, in Portsmouth, England. His family moved to London in 1822. The Dickens family often had money problems. For a while Charles had to leave school to work in a factory. He later wrote about the difficult working conditions he experienced.

Dickens finished school for good at age 15 and went to work. He wrote stories and articles for magazines and newspapers. His first novel, *The Pickwick Papers*, was published in 1837.

He wrote many famous books. *Oliver Twist* (1838) tells the story of an orphan boy in London. *A Christmas Carol* (1843) became one of the most popular Christmas stories of all time. Another novel, called *David Copperfield* (1850), was based partly on Dickens' childhood. In many of his later books, Dickens wrote about social problems that worried him. For example, his book *Hard Times* (1854) is about problems faced by factory workers.

In his later years, Dickens wrote less. He had grown tired. He published *A Tale of Two Cities* in 1859. It is a novel about the French Revolution. *Great Expectations* was published from 1860 to 1861. Dickens died on June 9, 1870.

Book and Bookmaking • Literature

Did You Know?

Most of Dickens' novels were first published as serials. They appeared a few chapters at a time in a magazine.

Dictatorship

A dictatorship is a form of government in which a person or a small group rules with almost unlimited power. The ruler of a dictatorship is called a dictator.

Absolute monarchs (kings) are another type of ruler with unlimited power. But monarchs usually inherit their position. By contrast, dictators take power by force or by misleading the people.

How Dictators Rule

Dictators may come to power in free elections and gradually take over the entire government. Or they may use force to throw out the current ruler. This is called a coup. When an army commander or a group of army officers takes power, it is called a military dictatorship.

General Augusto Pinochet overthrew Chile's president and became dictator in 1973. He ruled with military force.

Once in power, dictators use the police or the army to keep control. They often take away people's freedoms. In addition, many dictators cancel or control elections so that the people cannot vote them out of office.

A special form of dictatorship is totalitarianism. Totalitarian dictators control all parts of society. Schools, businesses, newspapers, and even the arts must follow the government's wishes. Anyone who displeases the dictator may be killed. The worst totalitarian governments of the 1900s were those of Adolf Hitler in Germany and Joseph Stalin in the Soviet Union.

History

The word dictator was first used in the ancient Roman Republic. At that time a dictator was a temporary leader. His great power lasted only during times of trouble. But one Roman leader, Julius Caesar, became dictator for life.

Dictatorships became common during the 1800s and 1900s. In those years many colonies of foreign nations gained their independence. As they did so they either became democracies or dictatorships. Many dictatorships arose in Latin America in the 1800s and in Africa in the late 1900s.

Digestive System

Animals need food for energy and growth. To use the food they eat, they

must change it into a form that the body can use. This process is called digestion. The different organs, or body parts, that are involved in this process make up the digestive system.

In humans the main organs of the digestive system are the mouth, the esophagus, the stomach, the small intestine, and the large intestine. The liver and the pancreas also help in the process of digestion.

Mouth

Digestion begins in the mouth, where the teeth chew the food. Glands in the mouth produce a digestive juice called saliva. The tongue mixes the food particles with the saliva. The saliva moistens and softens the food so that it can be swallowed easily. When a person swallows food it passes through the pharynx, or throat, into the esophagus.

Esophagus

The esophagus is a tube that connects the mouth to the stomach. In a process called peristalsis, the walls of the esophagus move in waves to push the food down the tube to the stomach.

Stomach

In the walls of the stomach, millions of glands produce digestive juices. The juices contain substances called enzymes and hydrochloric acid. These substances help to break down the food particles.

The stomach churns the food into a thick liquid called chyme. This process does not take place all at once. Starch

Many organs are involved in the human digestive system.

Did You Know?

The human digestive system is surprisingly long. If it were stretched out, it would measure five times the length of the human body.

mouth
pharynx
esophagus
stomach

small intestine

large intestine

and sugar are easily digested, so they remain in the stomach for only a couple of hours. Proteins remain for three to five hours. Fats may remain in the stomach even longer.

Small Intestine

From the stomach, peristalsis pushes the chyme into the small intestine. The small intestine is the longest part of the digestive system. Food remains in the small intestine for several hours.

Two large glands, the liver and the pancreas, are connected to the small intestine by ducts, or tubes. The glands send digestive juices to the small intestine through these ducts. Juice from the pancreas helps to digest carbohydrates, proteins, and fats. The liver makes bile, which helps to digest fat. Glands in the small intestine also produce digestive fluids.

All these fluids break down most of the remains of the food into simple chemicals. These chemicals enter the bloodstream through the walls of the small intestine. The blood carries the chemicals to the body's cells. The body then uses those chemicals as fuel for energy and growth.

A grasshopper's digestive system is basically a long tube divided into sections.

Large Intestine

Some substances, like plant fibers, cannot be broken down. These substances pass from the small intestine into the large intestine, or colon. The large intestine is much shorter and wider than the small intestine. The waste material slowly moves through the colon over a period of 10 to 20 hours.

The first section of the colon absorbs fluids and salts. The second section removes more water. This process turns the waste material from a liquid to a solid. The last section of the colon is a

A frog's digestive system has many similarities to the human digestive system.

holding area for waste. From there the waste passes out of the body through the anus.

Dili

Population
(2004 estimate)
51,700

Dili is the capital of East Timor, a country in Southeast Asia. East Timor takes up the eastern part of Timor Island. Dili has been its capital for hundreds of years. However, East Timor was not an independent country until 2002.

Dili is East Timor's largest city. It is also the country's main port and center of trade.

People have lived on Timor Island for thousands of years. Portuguese settlers founded Dili in about 1520. It became the capital of Portugal's colony on the island. East Timor declared its independence from Portugal in 1975. However, Indonesia soon captured East Timor.

In 1999 Indonesia began preparing to allow East Timor to become independent. Indonesian groups that opposed this killed hundreds of East Timor's

people. Dili was badly damaged, but it later began to rebuild. In 2002 East Timor became an independent country with Dili as its capital.

East Timor

Dinosaur

Dinosaurs were the main animals on Earth for more than 150 million years. They were lizardlike reptiles. Some of them were the largest and scariest creatures that ever walked on land. The word dinosaur comes from Greek words meaning "terrible lizard."

The last dinosaurs became extinct, or died out, about 65 million years ago. Fossils of dinosaurs were first discovered in the early 1800s. Fossils are remains or impressions of a plant or animal that have been preserved in rock. By studying these fossils, scientists know that dinosaurs were the ancient cousins of today's crocodiles, snakes, and lizards. Scientists also believe that today's birds descended from dinosaurs.

When and Where Dinosaurs Lived

The study of the history and physical features of Earth is called geology. Earth began forming about 4.6 billion years ago. Earth underwent many changes from then until the present. Geologists call this vast time period geologic time. They break geologic time into smaller time periods. Dinosaurs lived from about 215 to 65 million years ago. They

Did You Know?

At least 1,000 types of dinosaur are known. Paleontologists (scientists who study fossils) discover new types almost every year.

were common during the Triassic, Jurassic, and Cretaceous geologic time periods. Not all the species, or types, of dinosaur lived at the same time. They also did not all become extinct at the same time. They died out gradually.

Dinosaurs lived throughout the world, and their fossils have been found on every continent. They lived in all different kinds of environments as well, ranging from tropical forests to dry, sandy deserts.

Physical Features and Behavior

Dinosaurs were all different sizes. Some dinosaurs were smaller than a chicken. Others weighed as much as 100 tons—more than 10 times as much as the largest elephants.

Dinosaurs did not have any hair. Their skin had a bumpy or pebbly surface. Some scientists believe that dinosaurs were gray or green in color. These colors would have helped the dinosaurs blend in with their surroundings. Other scientists think that dinosaurs were very colorful. Bright colors would have helped males get the attention of females.

Scientists have divided dinosaurs into two large groups. The groups are based on the way a dinosaur's hip bones were shaped. One group is the Ornithischia, or bird-hipped dinosaurs. Members of this group are called ornithischians. The other is the Saurischia, or lizard-hipped dinosaurs. Members of this group are called saurischians.

Some dinosaurs had hip bones that resembled those of modern reptiles. Others had hip bones that resembled those of modern birds.

Ornithischian Dinosaurs

The ornithischians had hips shaped like the hips of today's birds. Despite this similarity, however, today's birds are not related to the ornithischians.

The ornithischians were plant eaters. They walked on either two or four thick, sturdy legs. Ornithischians generally had flat teeth to grind tough plants. They also had an extra bone at the tip of the lower jaw. This bone joined the two halves of the lower jaw together. It also helped to form a horny beak that made it easier for the dinosaurs to bite plants.

Many of the ornithischian dinosaurs had special features. Some, such as *Triceratops*, had horns like a modern rhinoceros. *Euoplocephalus* had a huge club at the end of its tail. *Stegosaurus* had large, triangular bony plates sticking out of its back.

Saurischian Dinosaurs

The saurischians had hips that look like the hips of today's reptiles. But they also had some features in common with today's birds. In fact, scientists believe that the saurischians are more closely related to birds than to some other dinosaurs. The earliest bird, *Archaeopteryx*, was a saurischian. The saurischians are divided into the meat-eating theropods and the plant-eating sauropods.

Theropods

The theropods include all the meat-eating dinosaurs. Among them is the fierce *Tyrannosaurus rex*, which weighed as much as 8 tons. *Giganotosaurus* and *Spinosaurus* were even larger. Theropods

Meat eater

Ceratosaurus had large bladelike teeth for slicing meat.

Plant eater

Psittacosaurus had a large parrotlike beak for tearing off and eating hard plant material.

Plant-eating and meat-eating dinosaurs had different mouth features.

walked on their two back legs. Most of them were built to hunt. They used their short front arms to catch and tear prey. Their fingers and toes had long, sharp claws. They had powerful jaws and sharp teeth for tearing flesh.

Theropods normally hunted alone. They caught and ate smaller, plant-eating dinosaurs. Sometimes they hunted in groups and attacked larger dinosaurs.

Sauropods

Sauropods were not only the largest of all dinosaurs. They were also the largest

land animals that ever lived. Sauropods were plant eaters that walked on four legs. *Brachiosaurus*, *Diplodocus*, and *Apatosaurus* are examples of sauropods.

Sauropods had a very small head and brain when compared to their huge body. But they had a long neck, which let them reach leaves on even the tallest trees. They had thick, strong legs, like those of an elephant. Many sauropods probably could stand up on their back legs to reach even higher into the trees. They used their long, muscular tail to balance themselves when standing. Some sauropods also might have used the tail as a whiplike weapon.

Life Cycle

Most, if not all, dinosaurs laid eggs. Some dinosaurs built large nests to keep their babies together. Young dinosaurs

A dinosaur sits on its eggs.

grew very fast. Many reached full size in seven or eight years. Large dinosaurs might have lived almost 100 years.

Extinction

The last dinosaurs died out about 65 million years ago. Scientists still do not agree about why this happened. Some scientists think that dinosaurs died out because the temperature on Earth got too hot or too cold for them. Others

The biggest dinosaurs may have been more than 130 feet (40 meters) long.

believe that a huge asteroid collided with Earth. The collision could have produced dust that blocked the sun's heat and light for months or even years. Plants would have stopped growing, and plant-eating dinosaurs would have died from lack of food. So would have the meat eaters that hunted them.

Some animals lived through the time when the dinosaurs disappeared. The ancestors of today's frogs, turtles, lizards, and snakes found a way to survive. Birds also survived. Scientists do not know why some animals lived but the dinosaurs did not.

Disability

A disability is a physical or mental problem that makes it difficult or impossible for a person to walk, see, hear, speak, learn, or do other important things. Some disabilities are permanent, or last forever. Others are temporary, or last for only a short time. A disability can be something a person was born with. Or it can be the result of an illness or an accident.

A physical disability is a problem with the body. Physical disabilities may affect the eyes, the ears, the muscles, or the interior organs. Some people with physical disabilities may use wheelchairs to move around.

A mental disability is a problem with the brain, or mind. Mental disabilities

Some children with a physical disability may use a wheelchair to get around.

include developmental disabilities (mental retardation), mental illness, and learning disabilities, such as dyslexia. A person with a mental disability may have trouble learning or getting along with other people.

With medical treatment or other help, people with disabilities can do many of the things that nondisabled people can do. A person with a missing leg can learn to walk with an artificial leg. Many kinds of mental illness can be treated with medication or other therapies. Organizations in a community can help people with developmental disabilities go to school, work, or live on their own.

Discrimination

Discrimination is unfair treatment of one particular person or group of people. Usually the different treatment is because

of the person's sex, religion, race, age, nationality, or other personal traits.

Discrimination prevents people from doing things that other people can do freely. It can happen in many ways and in many areas of life. It can happen at work, in public, and at school. For example, if a student is not allowed to go to a school because of his or her race, the school is discriminating against that student.

Sometimes even governments have discriminated against whole groups of citizens. A government may pass laws that make it harder for certain groups of people to vote, to go to school, to travel freely, or to do other things. For example, South Africa had a system of discrimination against the non-white people of the country for many years. The system was called apartheid.

Discrimination happens throughout the world. It is worse in some countries than in others. In the United States many

In South Africa, during the period called apartheid, blacks were not allowed to use the same beaches as whites. Such a rule is a form of discrimination.

people have worked to end discrimination. One of the most important laws passed to end discrimination was the Civil Rights Act of 1964. This law protects people from discrimination based on race and skin color, the country a person comes from, sex, and religion. The U.S. government has also tried to stop other forms of discrimination. These include treating people differently because of their age or because they have a disability.

Disease, Animal

Animals other than humans can suffer from diseases, or illnesses, just as humans do. People worry mainly about the diseases that affect animals used for food, the diseases that affect pets, and the diseases that can be spread from animals to people.

Like human diseases, animal diseases may be divided into two groups: infectious diseases and noninfectious diseases. Animal doctors, called veterinarians, can treat many of these diseases.

Infectious Diseases

Infectious diseases can spread from one animal to another. These diseases are caused by germs called viruses and tiny living things—bacteria, protozoans, fungi, and worms.

One of the most feared animal diseases is rabies. Rabies attacks the brain. A virus found in the saliva of animals with

rabies causes the disease. Rabies most often spreads through bites. People can catch rabies, too. However, a vaccine can protect people as well as animals from rabies.

Another virus causes Newcastle disease, which affects chickens, turkeys, and pet birds. The symptoms are like those of influenza, or flu. People can catch this disease from sick birds.

Tuberculosis, a disease caused by bacteria, affects cattle. The disease harms the lungs. Tuberculosis can be spread to people through cow's milk. Because of this, milk is often heated in a process called pasteurization. This kills the bacteria before they can infect a person.

Mad cow disease is caused by a particle, or tiny piece, of protein called a prion. Mad cow disease affects the brains of cattle. Farmers kill cattle that are sick with mad cow disease to keep the disease from spreading. People can catch mad cow disease by eating meat from sick cattle.

A veterinarian looks at a bulldog. Veterinarians can treat many animal diseases.

Heartworm is a serious disease of cats and dogs. A worm that infects the heart causes the disease. Medicines can prevent and treat heartworm.

Noninfectious Diseases

Noninfectious diseases cannot be spread from one animal to another. Many of these diseases are similar to noninfectious diseases in humans. Cancer affects many older dogs, cats, and other animals. Pets and many wild animals can suffer from arteriosclerosis. This is a disease in which the blood vessels become blocked. Many animals can also develop cloudy growths, called cataracts, over their eyes.

Animal • Disease, Human • Vaccine

Disease, Human

Diseases, also called illnesses or sicknesses, are conditions that make people unhealthy. Human diseases fall into two major groups: infectious diseases and noninfectious diseases.

Infectious Diseases

Infectious diseases are contagious, or catching. People may catch these diseases in a number of ways. Direct contact between humans spreads some infectious diseases. Animals, such as mosquitoes, spread others. Still others spread through air, water, or food.

Tiny living things called pathogens, or germs, cause infectious diseases. Once a pathogen has entered the body, the person is said to be infected. Pathogens include viruses, bacteria, fungi, and protozoans.

Some diseases caused by viruses are the common cold, influenza (the flu), chicken pox, measles, and AIDS. Diseases caused by bacteria include strep throat, tuberculosis, and Lyme disease. Fungi cause some skin diseases—for example, athlete’s foot and ringworm. Different protozoans cause malaria and sleeping sickness.

Doctors can often cure diseases caused by bacteria with drugs called antibiotics. Various medicines can treat diseases

To learn more about human diseases and disorders, turn to these articles:		
AIDS	Food Poisoning	Pneumonia
Alzheimer’s Disease	Hepatitis	Polio
Arthritis	Influenza	Reye’s Syndrome
Asthma	Lyme Disease	Rubella
Cancer	Malaria	Scarlet Fever
Cerebral Palsy	Measles	Smallpox
Chicken Pox	Meningitis	Strep Throat
Cholera	Mental Illness	Tonsillitis
Cold, Common	Mononucleosis	Tuberculosis
Diabetes	Mumps	West Nile Virus
Down Syndrome	Parkinson’s Disease	Yellow Fever
Epilepsy	Plague	

caused by viruses, fungi, and protozoans. Doctors also use vaccines to prevent people from catching many infectious diseases, especially those caused by bacteria and viruses.

Noninfectious Diseases

Many human diseases do not result from pathogens. These diseases are called noninfectious. They are not contagious.

Some noninfectious diseases are inherited, or passed down through families. They happen when there is a problem with one or more genes. (Genes are tiny units of information inside a person's cells.) Sickle cell anemia is a common inherited disease. It affects the shape of blood cells.

A person's lifestyle can lead to certain noninfectious diseases. People who eat poorly and do not exercise are in danger of getting heart disease or diabetes. People who smoke cigarettes are more likely to get lung cancer than non-smokers.

Environmental dangers or pollution can also cause noninfectious diseases. People who live close to polluting factories or toxic waste dumps may get cancer or other diseases.

Doctors do not know the exact causes of many noninfectious diseases. Alzheimer's disease and multiple sclerosis are two diseases whose causes are unknown.

Drugs, surgery, and other treatments can help to control some noninfectious diseases. But many of these diseases cannot

be cured. Scientists today are researching ways to cure inherited and other noninfectious diseases.

Disney, Walt

Walt Disney was a pioneer in the field of animated, or cartoon, films. He is best known for creating such characters as Mickey Mouse and Donald Duck.

Walter Elias Disney was born on December 5, 1901, in Chicago, Illinois. At an early age Walt had a gift for drawing and painting. While attending high school he took art classes to develop these skills. Disney left school to serve as an ambulance driver during World War I.

Walt Disney stands by a picture of Mickey Mouse. Mickey Mouse starred in more than 100 short cartoons.

Did You Know?

For many years Walt Disney himself was the voice of Mickey Mouse.

In 1923 Disney moved to Hollywood, California. There he began creating the characters that would make him famous. In 1928 he released the short cartoon film *Steamboat Willie*. It starred a cheerful mouse named Mickey. The next year Disney formed Walt Disney Productions to create more animated films.

Other popular cartoon characters followed. In the 1930s audiences were introduced to Minnie Mouse, Donald Duck, and Goofy. Disney's first full-length animated film, *Snow White and the Seven Dwarfs*, was released in 1937.

In the 1940s Disney's company began making movies with live actors. *Mary Poppins*, from 1964, was the most successful of these. Disney also continued making animated features, including such classics as *Pinocchio* (1940), *Cinderella* (1950), and *Peter Pan* (1953).

In 1955 Disney's company opened Disneyland, a large theme park in Anaheim, California. Walt Disney World, a second and larger amusement park, opened in Orlando, Florida, in 1971. Disney died on December 15, 1966.

Diwali

The Hindu religious holiday called Diwali (or Divali) celebrates the new year. Diwali is a major holiday in India, but it is celebrated by people living outside of India as well. The name Diwali

An Indian boy lights a lamp during Diwali. Sometimes people float the lamps on rivers.

comes from a Sanskrit word that means “row of lights.” The holiday is often called the Festival of Lights. During Diwali small lamps filled with oil light up houses and temples. The lights are meant to welcome the goddess of wealth. The festivities last for five days. The fourth day marks the start of the new year on the Hindu calendar. On the calendar used by most of the world, Diwali falls in late October or early November.

Diwali is one of the major religious holidays of Hinduism. People often visit friends and family during Diwali. They give each other gifts and eat their favorite foods, especially sweets. Merchants perform religious ceremonies and open new account books in the hope of gaining wealth.

Djibouti

The small Republic of Djibouti shares the Horn of Africa—a triangle of land on Africa's east coast—with Eritrea, Ethiopia, and Somalia. Its capital is the port city of Djibouti.

Geography

Djibouti sits between the Red Sea and the Gulf of Aden. The gulf is a part of the Indian Ocean. The climate is hot year-round, and it rarely rains. Much of the land is bare desert. Dry riverbeds and salty lakes dot the interior. Mountains rise in the north.

Plants and Animals

Djibouti's few plants include thorny shrubs and grasses. A small forest of olive, juniper, and acacia trees grows around Mount Mousa, the country's highest point. Millions of flamingos spend the winter around the salty Lake Assal. Other animals include hyenas, jackals, ostriches, antelope, and gazelles.

© 2006 Encyclopædia Britannica, Inc.

People

The country's two largest ethnic groups are the Issas and the Afars. The Issas are related to the Somalis of Somalia. The Afars are of Arabian origin. Nearly all the people are Muslims. The official languages are French and Arabic, but many people speak Somali or Afar. Most people live in or near Djibouti city.

Economy

Djibouti's economy depends on transportation services. Its port is a supply station for ships traveling through the Red Sea. A railway connects Djibouti to Ethiopia. In rural areas people raise goats and sheep.

History

Hundreds of years ago the region of Djibouti was part of a Christian Ethiopian empire. Arab traders brought Islam to the area in about the AD 800s. Muslims ruled the region until the 1800s, when France took control. The colony of French Somaliland became the French Territory of the Afars and Issas in 1967. The territory gained independence as Djibouti in 1977.

In the 1990s Afar rebels fought the Issa-dominated government. In the early 21st century warfare and drought in neighboring countries forced thousands of people to move to Djibouti.

Djibouti

Djibouti is a city in northeastern Africa on the Gulf of Aden, a part of the Indian Ocean. Djibouti is the capital of a small country that is also named Djibouti. Most of the country's people live in Djibouti city.

Djibouti city has a mixture of old and modern buildings in African and French styles. The economy of the city depends on trade through its port. Transporting goods on a railway to Addis Ababa, Ethiopia, also brings money to the city.

Djibouti city began as a port in about 1888. In that year the French built a station for fueling ships in the harbor. A city soon rose up. The colony called French Somaliland grew around the city. In 1892 Djibouti city became the capital of the colony.

Djibouti became an independent country in 1977. Djibouti city was its capital. The city grew rapidly in the late 20th century. Many people went there to escape droughts and wars in nearby countries.

DNA

DNA is the material that carries all the information about how a living thing will look and function. For instance, DNA in humans determines such things as what color the eyes are and how the lungs work. Each piece of information is carried on a different section of the DNA. These sections are called genes.

DNA is short for deoxyribonucleic acid. It is in every cell of every living thing. DNA is found in structures of the cell called chromosomes. Chromosomes are tiny. Scientists need to use very powerful microscopes to see them.

Functions

When DNA works correctly, it helps keep the body working properly. DNA helps cells to make the substances called proteins, which the cells need to live. DNA also allows living things to reproduce. The genes in DNA pass along traits from parents to children.

Part of a long DNA chain shows the twisted, ladderlike structure.

Sometimes there are mistakes in DNA. These mistakes are called mutations. They can cause unusual features, diseases, and other problems.

Structure

DNA has a complex structure. It is made of chemical substances that are linked together like a chain. Each piece of DNA has two long strands, or chains. The two strands are joined together. They form a shape like a ladder that has been twisted into a spiral.

Chemicals called phosphates and sugars make up the sides of the ladder. DNA also has chemicals called bases. Each base on one strand is joined to a base on the other strand. The linked bases form the rungs of the ladder.

Genetic Code

There are four different bases in DNA: adenine, thymine, guanine, and cytosine. These four chemicals are repeated in different orders over and over again in each strand of DNA. Human DNA contains about 3 billion pairs of these bases.

The order in which the bases are arranged is very important. It forms a code that tells cells to make certain kinds of proteins. The differences in these proteins is what makes different living things—such as a cactus, a gerbil, and two different people—different.

Dog

The dog is one of the most popular animals in the world. It was one of the first animals to be domesticated, or trained for use by humans. The dog's scientific name is *Canis familiaris*. It is related to the coyote, wolves, foxes, and jackals.

Where Dogs Live

People around the world keep dogs as pets, guards, or work animals. Some dogs, called feral dogs, do not live with people. These homeless dogs often roam around in groups, called packs. One type of dog, called the dingo, lives in the wild in Australia.

Physical Features and Breeds

The dog is a mammal with sharp teeth, an excellent sense of smell, and a fine sense of hearing. Each of its four legs ends in a foot, or paw, with five toes. Each toe has a soft pad and a claw. A coat of hair keeps the dog warm. It cools off by panting and hanging its tongue out of its mouth.

Some dogs are purebred. This means that both parents were of the same breed. A dog with parents of different breeds is called a mutt or mongrel.

Some Breeds of Dog			
	Breed	Origin	Height of Males (inches)
<i>Sporting dogs</i>			
	English cocker spaniel	England	16–17

Dog breeds are placed in seven different groups, according to the original function of the breed. For example, sporting dogs and hounds hunt animals. Working dogs do such jobs as pulling sleds or guarding homes. The table shows some dog breeds in each group.

Apart from these common features, dogs come in many different sizes, shapes, and colors. Dogs that have similar sizes, looks, and behaviors make up groups called breeds.

Behavior

Dogs are carnivores, which means that they eat meat. Pet dogs eat dog food made with meat products. Wild dogs hunt animals.

Dogs claim territory and mark it as their own. They do this by urinating and rubbing their scent on things. But dogs also like to be around people and other dogs. People can even train dogs to obey simple commands.

Dogs make many sounds, including barks, howls, and growls. They also use movements to communicate. For example, when a dog wags its tail, it is happy. If it shows its teeth and growls, it is making a threat.

Life Cycle

A female dog gives birth to a litter of puppies about two months after mating. A litter contains two to 12 puppies. Newborn puppies depend on their mother for her milk and protection. Puppies become more independent when they are three or four months old. Dogs live for 10 to 15 years.

Dogs and Humans

Dogs have been with humans since prehistoric times. The ancient Egyptians thought dogs were holy. The ancient Romans kept watchdogs. In the palaces

of ancient China, people kept small dogs in the sleeves of their robes.

Over the years, people developed different breeds of dog for different purposes. Toy dogs, including the poodle and the pug, were meant to be pets. Other dogs were meant to do certain jobs. For example, the golden retriever and other sporting dogs helped people to hunt birds. Some of these dogs are now mainly pets. Others still do their traditional jobs.

Working dogs do many other jobs today. Some sniff bags in search of explosives or drugs. Others track missing people. Guide dogs help blind people get around.

Dolphin

Dolphins look like big fishes, but they are actually mammals. They belong to a large group of animals called whales. Dolphins are closely related to porpoises. Because dolphins and porpoises look so much alike, people often confuse the two. However, dolphins are usually larger and have longer, beaklike snouts.

There are more than 35 species, or types, of dolphin. They are divided into

two groups: true dolphins and river dolphins. True dolphins live throughout the world in either salt water or freshwater. The most widespread species are the common dolphin and the bottlenose dolphin. River dolphins live in freshwater in South America and Asia.

Most dolphins are 7 to 10 feet (2 to 3 meters) long, but some species can reach a length of 13 feet (4 meters). Dolphins have smooth, rubbery skin. They have a flipper on each side and a fin on the back. A dolphin must come up to the water's surface to get air. It breathes through a single nostril, called a blowhole, on the top of its head.

Dolphins are known for being intelligent and playful. They live together in groups, called schools. They use sounds to communicate.

Female dolphins give birth to one baby, or calf, at a time. Some types of dolphin may live for 30 years.

Although dolphins look like fish and live in the water, they are actually mammals.

Dominica

The Commonwealth of Dominica is a small island republic in the Caribbean Sea. Christopher Columbus named the island after the Latin phrase *dies dominica*, which means “the Lord’s day.” Columbus had first spotted the island on a Sunday. Dominica’s capital and largest city is Roseau.

Geography

Dominica lies between the French islands of Guadeloupe and Martinique. It is about 29 miles (47 kilometers) long and less than 16 miles (26 kilometers) wide. A forest-covered mountain range runs from north to south. Dominica has a hot climate with dry and rainy seasons.

Plants and Animals

The Dominican jungle may be the last original rain forest in the Caribbean. It is filled with iguanas, boa constrictors, rabbit-sized rodents called agoutis, and large frogs called crapauds. Imperial

parrots and red-necked parrots live only in Dominica.

People

Most Dominicans are descended from Africans. There are also small groups of whites, Asians, and Caribs (American Indians). English is the official language, but a form of French is commonly spoken. Most Dominicans are Roman Catholics. Almost three fourths of the population lives in cities.

Economy

Dominica is one of the poorest Caribbean countries. Its economy depends on farming, and hurricanes sometimes destroy the crops. Bananas are the main crop. Other crops include root vegetables, citrus fruit, and coconuts. Manufacturers produce mainly soap, toothpaste, and coconut oil. Dominica’s main mineral resource is pumice, a type of volcanic rock.

History

In 1493 Columbus arrived at Dominica, which was inhabited by Caribs. The French set up a colony there in the 1630s. Settlers later brought Africans to work on plantations as slaves. Great Britain won control in 1783. In 1978 the island became independent. Since then Dominica’s leaders have worked to improve the economy.

Dominican Republic

The Dominican Republic is located on the island of Hispaniola in the Caribbean Sea. The people are known for their merengue dance and their passion for baseball. The capital is Santo Domingo.

Geography

Hispaniola lies between the islands of Cuba and Puerto Rico. The Dominican Republic occupies the eastern two thirds of Hispaniola. Haiti occupies the western third. The island has fertile valleys, desertlike areas, and four mountain ranges. Duarte Peak, at 10,417 feet (3,175 meters), is the highest mountain in the West Indies. The country has a tropical climate with warm temperatures year-round.

Royal palm trees grow throughout the Dominican Republic. Rain forests occur in the wetter areas. The country's wildlife includes alligators and many birds.

People

Most Dominicans have mixed European and African roots. Spanish is the main language. The majority of the population is Roman Catholic. Most people live in cities and towns.

Economy

Services—including tourism and telecommunications—are the main economic activities. Manufacturers make cement, sugar, beer, clothing, and cigars. Farmers grow sugarcane, rice, bananas, cocoa, and coffee. The country also has deposits of nickel and gold.

History

Christopher Columbus discovered Hispaniola in 1492. In 1496 the Spanish founded Santo Domingo. Within decades most of the native Carib and Taino peoples had died. The Spanish brought in slaves from Africa.

France gained control of Hispaniola in 1795. Haiti won independence from France in 1804. Spain took back control of eastern Hispaniola, but the Dominicans declared independence in 1821. Soon afterward the Haitians invaded.

The Dominican Republic achieved independence from Haiti in 1844. It then alternated between weak democracies and governments led by dictators.

Donkey

A farmer leads a donkey and cart across a plowed field.

The donkey is a member of the horse family. The words donkey and ass are used to identify the same animal. However, the term donkey is used for domesticated, or tamed, animals. The term ass is more often used when the animal is wild. Donkeys are descendants of the African wild ass. They were first domesticated by humans in Africa. They are now used around the world as working animals.

The average donkey stands 40 inches (102 centimeters) at the shoulder, but different breeds vary greatly in size and shape. Donkeys range from white to gray or black in color. They usually have a dark stripe from the mane to the tail and a crosswise stripe on the shoulders. The mane is short and upright, and the tail has long hair only at the end. The ears are very long and are dark at the base and tip. A donkey can carry heavy loads over rough land. The donkey can handle the uneven ground of the mountains better than a horse can.

On average female donkeys give birth 12 months after mating. Donkeys sometimes breed with horses to produce animals called mules. Donkeys can live up to 50 years.

Douglass, Frederick

His brilliant speaking and writing made Frederick Douglass a leader of the movement to abolish slavery. A former slave himself, Douglass was also the first African American citizen to hold an important position in the U.S. government.

Early Life

Frederick Augustus Washington Bailey was born sometime in 1817 or 1818 in Talbot County, Maryland. His mother was a slave. He never knew his father, who was a white man.

Frederick Douglass

At the age of 8, Frederick was sent to live in Baltimore as a house servant with the family of Hugh Auld. Auld's wife, Sophia, taught Frederick to read.

In 1838 Frederick escaped to New York City, where he lived as a free man. He married Anna Murray of Baltimore, a free woman. They settled in New Bedford, Massachusetts, and Frederick changed his last name to Douglass.

Did You Know?

During the American Civil War Douglass organized two black Army units. He also tried to get equal pay for black soldiers.

Antislavery Work

At an antislavery convention in 1841 in Nantucket, Massachusetts, Douglass was invited to describe his experiences as a slave. His moving speech marked the beginning of his career as an abolitionist.

Douglass was so impressive as a speaker that some of his critics doubted that he could ever have been a slave. Douglass addressed these critics in 1845 by publishing his autobiography, *The Narrative of the Life of Frederick Douglass, an American Slave*.

In 1847 Douglass founded an antislavery newspaper in Rochester, New York, called *The North Star*. While in Rochester, Douglass helped to smuggle escaped slaves to Canada via the Underground Railroad.

Later Life

During the American Civil War Douglass was a consultant to President Abraham Lincoln. Douglass suggested that former slaves should be given weapons to fight for the North.

After the Civil War, Douglass held several government offices. He also continued to fight for human rights until he died in Washington, D.C., on February 20, 1895.

Down Syndrome

Down syndrome is a disorder, or unusual condition, that can cause delays in a child's development. About 1 in 800 babies is born with Down syndrome. Down syndrome happens when an infant's cells have 47 instead of 46 chromosomes. (Chromosomes are tiny structures in a cell that carry information about people, such as what color eyes and hair they will have.)

Having an extra chromosome can cause developmental disabilities. This means that people with Down syndrome may have trouble learning or taking care of themselves. They may have certain medical problems, too. Some of the most common problems are heart defects and problems with hearing, vision, digestion, and the thyroid gland. Most people with Down syndrome get special medical care from the time they are babies.

A girl with Down syndrome plays the guitar.

In the past many children with Down syndrome lived in special homes apart from their families. Today most people with Down syndrome grow up in their parents' homes. They make friends, go to school, and play sports. As adults many people with Down syndrome have jobs. They often live in group homes or apartments.

Dragonfly

Dragonflies are flying insects with two pairs of see-through wings, huge eyes, and long bodies. Dragonflies live near lakes, streams, and ponds throughout most of the world. There are about 2,500 species, or types, of dragonfly.

A brightly colored dragonfly pauses for a rest.

The insects vary greatly in color. They also range widely in size. The smallest dragonflies have wingspans about 0.8 inch (20 millimeters) across. The largest ones have wingspans about 6 inches (15 centimeters) across. Dragonflies' wings stand out sideways from their bodies even when they are resting.

Adult dragonflies feed mostly on other insects, and their bodies make them deadly hunters. Dragonflies fly faster than most other insects. They can also instantly change the direction of their flight and hover like tiny helicopters. Their large eyes allow them to spot prey above, below, in front, behind, and on both sides of them.

Dragonflies hatch from eggs in or near bodies of freshwater. They hatch as larvae, or undeveloped forms that do not look anything like the adults. Dragonfly larvae live in water. They are fierce hunters and use a pair of fanglike pincers to catch worms, tadpoles, and small fish.

The larvae grow quickly and shed their skin several times. During this time they develop adult features. Eventually, the larvae crawl out of the water. They shed their skin one last time and fly away as adult dragonflies.

Drake, Francis

The navigator Sir Francis Drake helped to build up England's power during the reign of Queen Elizabeth I. He opened the Pacific Ocean to English ships. He also helped defeat the Armada, the fleet (group of ships) that Spain sent to conquer England.

Francis Drake was born in about 1540. At about age 13 he first worked as a sailor. In his early 20s he joined a slave-trading fleet. Off the coast of Mexico, the Spanish attacked the fleet. Drake disliked the Spanish from that time on.

Francis Drake

A map shows the route that Sir Francis Drake took on his trip around the world in 1577.

In 1572 Drake attacked a Spanish settlement in Panama. Then he marched across Panama and saw the Pacific Ocean. Spain controlled travel in the Pacific. Drake wanted English ships to be able to use the ocean.

In 1577 Queen Elizabeth sent Drake on an around-the-world voyage. Drake left England with five ships, but only his ship completed the trip. He passed through the Strait of Magellan, at the southern tip of South America, and into the Pacific. He then sailed up the coasts of South and North America. In 1579 he crossed the Pacific and Indian oceans. In 1580 he returned to England. His ship was loaded with treasure. Queen Elizabeth rewarded Drake by making him a knight.

In 1586 King Philip II of Spain gathered a fleet of warships—called the Armada—to invade England. In 1587 Drake destroyed many of the ships in a raid on the Spanish port of Cádiz. When the Armada invaded in 1588, Drake was a leader in driving it back. He became England's hero.

Drake's last voyages were less successful. In January 1596, while fighting the Spanish in the West Indies, he became ill and died.

Drama

A drama is a type of story acted out before an audience, often in a theater.

The characters of Captain Hook and Peter Pan fight with their swords.

Dramas are commonly called plays. Other forms of literature, such as novels and short stories, are meant to be read by individuals. But through staged productions dramas are shared with many people at once.

Elements of Drama

A person called a playwright, or a dramatist, writes the play's text. The major elements of a play, or drama, include the characters and the plot. The characters, or the people in the story, often come into conflict with each other over something. For example, they may desire the

Fun costumes bring the characters to life in a performance of *Where the Wild Things Are* by Maurice Sendak.

same throne, princess, or treasure. The plot is what happens during the play and how the conflicts are settled.

In a play the characters use their words and movements to tell the story. Often the characters talk to each other. The words of their conversations are known as dialogue. Sometimes, however, a character will make a speech while alone onstage or with the other characters silent. This creates the illusion that the audience can hear the character's thoughts. That kind of speech is called a soliloquy. Occasionally a character will speak directly to the audience. That is called an aside.

A playwright might write dialogue that sounds natural, or how people of a particular time and place actually talk. Or the dialogue may be very formal. For instance, sometimes the characters' words are written in poetry. In some dramas the characters may sing or chant their words.

The playwright also writes short instructions, called stage directions, in the text. Some stage directions tell the actors what to do, such as when and where to enter the stage. Other directions may describe what a character looks like. They may also indicate the time and place of the action. The play's designers use these descriptions to create the scenery, costumes, and lighting.

Dramatic Traditions

Different dramatic traditions developed in Asia and the West (Europe and North America). In the dramas of many cul-

tures in Asia, dance, gestures, and music are often as important as the words. Asian dramas often use familiar stories as a base. They also tend to have a formal style. The actors may follow a set of rules about the facial expressions and body movements they use to tell the story.

On the other hand, Western dramas tend to focus on telling a new story through dialogue. Traditionally, Western dramas have been divided into two broad types: tragedies and comedies. Tragedies are serious stories about heroic individuals. They have a sad ending. Comedies are less serious and have a happy ending. Modern comedies are often funny. Today many Western dramas mix elements of tragedy and comedy.

History

Early Forms

Scholars believe that drama dates back to the time of the earliest peoples. Drama probably began as part of religious festivals and ceremonies. These took place in many cultures, including those of ancient Egypt, India, and China.

Western drama has its roots in ancient Greece. The great age of Greek drama was the 400s BC. Greek drama was written in poetry. A few actors portrayed all the play's characters. Greek playwrights also wrote parts for a group called the chorus. The chorus stood off to the side and described and explained the action. Greek tragedies told about important

Actors perform in William Shakespeare's *A Midsummer Night's Dream*.

people and events from legends or history. The comedies from this period often made fun of the day's political figures.

During the Middle Ages (AD 500–1500) in Europe most drama was based in Christianity. Some plays of the period told stories from the Bible. Others dramatized the lives of Christian saints or presented a moral lesson.

In the 1300s in Japan a new form of drama, called Noh, developed. A Noh drama presents classical Japanese legends using movement, music, and words. About 230 of the classical Noh stories are still performed today. A man named Zeami wrote 90 of them. He is considered the greatest Noh playwright.

The 1500s and 1600s were a great period for drama in England and Spain. Playwrights wrote in a wide range of styles. The greatest playwright of this period was William Shakespeare of England. He wrote complex, action-filled plays with realistic characters.

In the 1600s Jean Racine and other French dramatists wrote plays set in ancient Greece. Their plays featured grand themes and poetic language. The French playwright Molière wrote a different type of play. His comedies poked fun at the fashions and faults of French society of the time.

In the 1700s in Japan a type of puppet theater called Bunraku reached its artistic height. A man named Chikamatsu Monzaemon wrote Bunraku plays that were admired as both literature and entertainment. He wrote historical romances as well as tragedies about ordinary people of his time.

Modern Drama

In the 1800s and early 1900s many Western plays focused on ordinary people rather than kings, warriors, or legendary heroes. These plays explored the characters' inner struggles. Many plays also dealt with social problems, such as corruption and greed in society. Henrik Ibsen of Norway and Anton Chekhov of Russia wrote plays in this

August Wilson's play *The Piano Lesson* is about the African American experience in the United States.

realistic style. In England George Bernard Shaw used humor to attack society's problems. Eugene O'Neill of the United States used some of the themes of ancient tragedies. But he placed them in more modern times among everyday characters.

After World War II ended in 1945 many people felt discouraged about the state of the world. Some European playwrights wrote plots and dialogue that made little sense. This was meant to show that life is ridiculous. Their plays came to be known as Theater of the Absurd.

Other playwrights continued to explore familiar topics. In the United States Arthur Miller wrote dramas that focused on the inner lives and family conflicts of strong characters. Similar themes appeared in the plays of Tennessee Williams. Williams often set his plays in the southern United States.

In the late 20th and early 21st centuries playwrights of many different backgrounds began to produce notable dramas. Starting in the 1960s several African American dramatists, such as August Wilson, became successful. Social problems and the conflicts of ordinary people continued to provide material for playwrights. But many playwrights also experimented with bold, fresh ways of telling their stories.

Drawing

Drawing is a form of art. To make a drawing, an artist puts lines on paper or another surface. Most artists start out by learning to draw. This is because drawing is the starting point for painting, sculpture, and other art forms.

Drawing Tools

Artists can choose from many tools for drawing. Pencils, pens, and pastels are common drawing tools. Artists' pencils come in a wide range of hardness. Softer pencils make darker marks. Artists' pens may have different tips for making wide or thin lines. Some artists use special pens that they dip in ink before drawing. Pastels are chalklike sticks made of colored powder. Other drawing tools include charcoal, crayons, and chalk.

Paper is by far the most common surface for drawing. Paper comes in many colors

Many artists draw with charcoal. Charcoal is made from partially burned, or charred, wood.

and textures. Artists often use smooth paper for fine drawing.

Many artists today use computers to create drawings. Special software allows artists to draw with a mouse or a drawing pad.

How Artists Draw

Drawings are usually made up of lines. An artist can put lines together to form figures, or pictures of things. Artists also can use lines to stand for borders between a figure and the space that surrounds it.

To create shadows, an artist can combine or cross lines. In a technique called hatching, an artist draws short, parallel lines to make light and dark areas. In a technique called crosshatching, an artist uses two sets of parallel lines that cross each other.

Not all drawings are made with just lines. Artists often fill in parts of their drawings by rubbing their drawing tools across the drawing surface. This technique creates shadows or areas of solid color. Some artists use spots and dots to fill in areas or to create forms.

History

People have been drawing since prehistoric times. Prehistoric people drew on cave walls, on rocks, and probably on sand. Early drawings eventually developed into writing. Ancient Egyptian writing, called hieroglyphics, was a system of picture symbols. Many of the characters in Chinese writing also were drawings at first.

Did You Know?

The drawing ink called India ink is made from the soot of burning wood or burning oil.

Many children draw on sidewalks with chalk. When it rains, the drawings are washed away.

Chinese artists made ink drawings as early as 3,000 years ago. By about 1,000 years ago the Chinese drew on scrolls, or long, rolled pieces of paper or silk. Asian artists generally used brushes instead of pens to make ink drawings.

Drawing in Europe became a form of fine art during the Renaissance. The Renaissance was a time of great culture that lasted from the 1300s through the 1500s. Artists in Italy—including Leonardo da Vinci, Raphael, and Michelangelo—made many fine drawings. Da Vinci created drawings of the human body as well as scientific drawings. In Germany the artist Albrecht Dürer made detailed pen-and-ink drawings of religious subjects.

Later European artists made drawings that showed their opinions. In the 1700s the English artist William Hogarth made drawings that made fun of human mistakes. In the 1800s the Spanish artist

Francisco Goya made drawings that showed the horrors of war.

In the 1900s many artists made drawings that looked less realistic than earlier drawings. They used geometric shapes or free-flowing lines to represent people and objects. Some artists made abstract drawings, or drawings that did not represent anything. These drawings were meant to express emotions or ideas. The Spanish artist Pablo Picasso made some of the greatest drawings of this period.

Today drawing is still a popular form of art. But people also use drawing for many business and entertainment purposes. Advertisers use drawings to sell products. Fashion artists and designers of products use drawings to plan their work. Illustrators and cartoonists draw pictures for books, newspapers, and magazines. In addition, many children and adults draw just for fun or relaxation.

Dred Scott Decision

In 1857 the U.S. Supreme Court ruled that Congress had no power to ban slavery in the territories, or areas that were not yet states. The ruling, called the Dred Scott decision, increased tensions between the proslavery South and the antislavery North.

Dred Scott was a slave who sued for his freedom. He did not win his court case.

Dred Scott was a black slave in Missouri. In 1834 he was taken to Illinois. Illinois was a free state, meaning that slavery was illegal there. Scott later lived in the territory of Wisconsin, where slavery was also illegal. When Scott was taken back to Missouri, he sued for his freedom. He argued that the time he had spent in a free state and a free territory had made him free.

Scott's court case began in Missouri and made its way up to the U.S. Supreme Court. The court ruled against him. In fact, the court said that he did not even have the right to file a lawsuit. The court also changed an earlier law that had banned slavery in territories north of Missouri. This angered people who were against slavery. The issue of slavery grew to be so much of a problem that it led to war between the

states in 1861. The defeat of the South in the American Civil War finally ended slavery.

Drought

Wherever there is a shortage of rain over a long period of time, there is drought. Drought affects plants, animals, and people. It is a serious problem for farmers and for the people who depend on the crops they produce.

Drought may occur almost anywhere in the world. Deserts receive very little rain all year. They are sometimes said to be in a permanent drought. Places that have a rainy season and a dry season have seasonal drought during the dry season. Other places can experience drought at any time.

Drought results from changes in Earth's atmosphere. Some droughts are caused by shifts in the winds that normally bring rain to an area. Others are caused by changing ocean currents, which affect the temperature and moisture of the air.

Severe droughts can last for months or years. When this happens no crops will grow. As a result many people and animals may die of famine, or lack of food. Severe droughts often force people and animals to move to find water. Some farmers go to places where they think conditions will be better for their crops

Did You Know?

Drought can lead to dust storms. When soil dries out and cracks it can be blown away by wind.

Cracked, dry dirt covers marshland in a drought region of California.

and animals. Some people give up farming altogether. They move to cities to find other types of work.

Drug

A drug is a substance that changes the way a person's body works. Medical drugs can ease the symptoms of illnesses and fight diseases. Some people also use certain kinds of drugs for nonmedical purposes.

How Drugs Work

Some drugs work by changing the way cells in the body behave. For example, a chemical in the body called histamine causes the symptoms of allergies. Drugs called antihistamines ease these symp-

toms. The drugs do this by joining with cells to block the histamine.

Other drugs attack living things that invade the body—for example, bacteria and parasites. Drugs can kill these organisms, stop them from reproducing, or block their effects.

Medical Drugs

Patients get drugs from doctors or from pharmacies. Pharmacies can give certain drugs to patients only after a doctor orders them. Doctors' orders for drugs are called prescriptions. Patients can also buy some drugs without prescriptions—for example, aspirin and cough syrup.

Drug manufacturers must prove that their drugs are safe and that they work before they can be sold. In the United

Pain relievers, such as aspirin, are a very popular type of drug. Store shelves are crowded with the many different brands.

States the Food and Drug Administration studies all drugs before they can be sold there.

Illegal Drugs and Drug Abuse

Many governments around the world have banned the use of certain drugs—for example, marijuana, cocaine, LSD, heroin, and Ecstasy. These illegal drugs are generally not used as medicine. People often take illegal drugs for fun but ignore the harmful side effects. They may become addicted, or unable to stop taking the drugs. They may get sick or even die.

Such dangerous use of illegal drugs is called drug abuse. People can abuse legal drugs, too. They may take medication when they are not really sick, or they may take too much.

History

Throughout history almost every society has used drugs for medicine and for rituals. Early people made drugs from plants, animals, and minerals that they found in nature. Eventually scientists learned how to take different chemicals out of those natural materials. They studied what those chemicals did to the body and decided which illnesses they could treat. From those chemicals they created drugs.

Dublin

Population
(2006 census),
city, 506,211;
urban area,
1,186,159

Dublin is the capital of Ireland, a country in western Europe. The city lies on the Irish Sea. The River Liffey flows through the middle of Dublin.

Dublin is the largest city in Ireland by far. It is also the center of Ireland's economy and culture. Trinity College was founded in Dublin in 1592. It is Ireland's oldest university.

Dublin's economy grew greatly in the early 21st century. Most people in Dublin work in service industries such as

Dublin Castle lies on Cork Hill near the river. The English used the castle as their headquarters until 1922.

tourism and banking. The city is one of Europe's leading producers of computer software. Factories in Dublin make electronics, food products, beer, and medicines. The city is also the main port of Ireland.

Vikings from what is now Denmark founded Dublin in the 800s. In 1014 an Irish group took over the city. The English started taking control of Ireland in 1170. They made Dublin the center of the English government in Ireland.

In 1801 Ireland was joined to England, Scotland, and Wales to form the United Kingdom. As a result Ireland's lawmakers began to meet in London, England, instead of Dublin. Dublin lost some of its importance.

Irish groups began to rebel against English rule in the mid-1800s. Dublin was often the site of violence. In 1921 Ireland became an independent country with Dublin as its capital.

Du Bois, W.E.B.

W.E.B. Du Bois was an early leader of the civil rights movement in the United States. His goal was to win equal rights for African Americans.

William Edward Burghardt Du Bois was born on February 23, 1868, in Great Barrington, Massachusetts. He went to Fisk University and to Harvard University. He earned a doctoral degree at Harvard in 1895.

Du Bois became a professor who studied and wrote about black life in the United States. His most famous book, *The Souls of Black Folk*, encouraged blacks to fight inequality.

Du Bois disagreed with Booker T. Washington, another important African American leader. Washington opposed protest as a way to change society. Du

W.E.B. Du Bois

Bois believed that blacks could achieve racial equality only through protest.

In 1905 Du Bois began organizing groups to demand equal rights for blacks. In 1909 he helped form the National Association for the Advancement of Colored People (NAACP).

Late in life Du Bois lost hope that the United States could solve its racial problems. He became a citizen of Ghana, in West Africa, in 1963. He died there on August 27, 1963.

Duck

The waterbirds called ducks are related to geese and swans. There are about 100 species, or types, of duck. They are found almost all over the world. Many types migrate, or fly long distances to spend different seasons in different regions. People keep ducks for their meat, eggs, and feathers. Some hunters shoot ducks for sport.

Physical Features

Ducks, geese, and swans are called waterfowl in North America and wildfowl in Europe. These birds have stout bodies and webbed feet. Soft inner feathers called down protect them from cold. A gland near the tail produces oil. This oil helps protect the outer feathers from water.

The male mandarin duck is known for its colorful markings.

Ducks are the smallest of the waterfowl. For instance, the mallard is a fairly large duck at about 24 inches (61 centimeters) long. Ducks' legs are set far back on their bodies. This helps them swim well but makes them waddle when walking.

Female ducks have mainly brown or gray feathers year-round. The males look like the females for part of the year. But most males have more colorful feathers during the breeding season. For example, breeding male mallards have shiny green heads.

Behavior

Many types of duck feed at the water surface. They dip their heads below the surface while tipping up their tails. These ducks are called dabbling ducks. They eat mainly plants and insects. They include mallards, black ducks, teals, pintails, and shovelers.

Many ducks nest on the ground near water. Perching ducks are dabbling ducks that nest in trees. They include the wood duck and the mandarin duck.

Ducks that dive deep into the water are called diving ducks. Some types eat mostly fish and live on the open seas.

These sea ducks include mergansers, scoters, and eiders. Other diving ducks stay close to shore.

Duncan, Isadora

Isadora Duncan based her dancing on natural rhythms and movements.

In the early 1900s the dancer Isadora Duncan created a new form of dance. Duncan rejected the strict rules of ballet, which was the main form of dance at the time. Duncan's free style of dancing came to be known as modern dance.

Duncan was born in San Francisco, California, on either May 26, 1877, or May 27, 1878. She was one of four children raised by their mother, a poor music teacher. At first her name was Angela Duncan. While in her teens she changed her first name to Isadora.

Duncan learned ballet as a child. However, ballet's rigid movements did not please her. She soon began to invent a more natural way to express herself through dance. Duncan performed in New York City and Chicago, Illinois, but she did not have much success. At age 21 she left for Europe.

Duncan's dancing fascinated European audiences. She danced to classical music, just as ballet dancers did. But Duncan made up many of her moves during each performance. She was the first Western dancer to perform barefoot and without tights. She wore a loose dress based on ancient Greek costumes.

Duncan eventually opened dance schools in France, Germany, the United States, and the Soviet Union. She taught her students how to follow the natural movements and rhythms of their bodies. Duncan's ideas inspired many future generations of modern dancers.

In 1922 Duncan married a poet from the Soviet Union. Many people in the United States feared the Soviets. Some accused Duncan of being disloyal to the United States. She then left her home country for good. Duncan died in Nice, France, on September 14, 1927.

Du Sable, Jean-Baptist-Point

Jean-Baptist-Point du Sable

Jean-Baptist-Point du Sable was an African American trader. He was the first non-Native American to settle in what is now Chicago.

Du Sable was born around 1745 or 1750 in Saint-Domingue (now Haiti). His father was French-Canadian and his mother was a slave from Africa. In 1764 he moved to the French territory of Louisiana. He later settled in what is now Peoria, Illinois, where he married a Native American woman of the Potawatomi tribe.

In the 1770s the Du Sables settled near the southern shore of Lake Michigan. The Native Americans called the area by a name that is now spelled Chicago. There Du Sable established a successful trading post where he sold supplies and food.

In 1800 Du Sable sold out and moved to Missouri, where he continued as a farmer and trader until his death. But his 20-year residence on the shores of Lake Michigan had established his title as Father of Chicago. Du Sable died in Saint Charles, Missouri, on August 28, 1818.

Dust Bowl

The worst drought (lack of rain) in U.S. history hit the southern Great Plains in the 1930s. High winds stirred up the dry soil. This caused huge dust storms that ruined farmland. The affected

A lack of rain and strong winds ruined farmland and created the region known as the Dust Bowl in the 1930s.

region came to be known as the Dust Bowl. It included southeastern Colorado, western Kansas, the panhandles of Texas and Oklahoma, and northeastern New Mexico.

Human mistakes made the drought worse. During World War I (1914–18) farmers planted new fields of wheat. Their plows removed grasses that had held the soil in place. Cattle grazing on ranches removed more grass. The loss of the grass cover loosened the soil.

Winds blew soil away in dust storms called “black blizzards.” The storms blocked out the sun and piled dirt in drifts. Some dust storms swept across the country to the East Coast.

During the drought, fields produced only one fourth as much wheat and corn as before. Farmers struggled even more because the drought came during the Great Depression. The depression was a time of great economic hardship. People whose farms were ruined could not find other jobs. Many moved to California, where farms were still operating.

The U.S. government helped the Dust Bowl area recover. Workers in government programs planted grass and trees to keep soil in place. A government agency taught farmers better farming methods. Near the end of the 1930s rainfall finally increased. By the early 1940s the fields in the Dust Bowl area were productive again.

Eagle

Eagles are large birds of prey, meaning that they hunt and eat animals for food. They are related to hawks, falcons, and vultures. Eagles have long held a special place in the human imagination because of their strength and soaring flight. The golden eagle has been a symbol of power since ancient times. The bald eagle is the national symbol of the United States.

Eagles are found nearly all over the world in many different habitats. There are more than 50 species, or types, of eagle. All are excellent hunters because of their keen eyesight, strong claws, and hooked beak. Different types of eagle eat a great variety of animals. Their prey ranges from fish, birds, or snakes to rabbits, foxes, monkeys, and even deer.

Female eagles are generally larger than males. A female bald eagle may be as long as 43 inches (1.1 meters). A male bald eagle is about 36 inches (0.9 meter) long. Golden eagles are similar in size.

The bald eagle was once endangered, or at risk of dying out. Laws protecting the bird helped to raise the number of bald eagles in the wild.

The main groups of eagles are sea eagles, booted eagles, forest eagles, and serpent eagles. Sea eagles snatch fish out of rivers, lakes, or seas. The bald eagle is a type of sea eagle that lives in North America. It is not actually bald. It has brown body feathers with white feathers on its head and neck.

The golden eagle is found in North America, Europe, Asia, and northern Africa. It is a type of booted eagle, which has feathers on its legs. The golden eagle is dark brown with golden feathers on its head and neck.

Forest eagles are huge birds that live in rain forests. Serpent eagles are snake-eating birds of Asia and Africa.

Ear

Ears are the organs, or body parts, in humans and many other animals that allow them to hear. Ears work by picking up vibrations (tiny back-and-forth movements), usually in the air or water. Then they change the vibrations into signals that the brain understands as sound. Ears also help an animal to keep its body in balance.

The Human Ear

Humans have two ears, one on each side of the head. Each ear has three sections: the outer ear, the middle ear, and the inner ear.

The three main parts of the human ear are the outer, the middle, and the inner ear.

The outer ear is divided into two main parts: the auricle and the ear canal. The auricle is the part of the ear that is visible on the sides of the head. It is made of a tough material called cartilage. It collects sound waves and sends them into a curved passageway called the ear canal.

The ear canal leads to the eardrum, which separates the outer ear from the middle ear. The eardrum vibrates when sound hits it. It then passes the vibrations to the middle ear.

The middle ear is an air-filled space. It is about 0.75 inch (1.9 centimeters) high and 0.20 inch (0.5 centimeter) wide. Inside this space are three small bones. These bones work together to send vibrations along to the inner ear.

The inner ear is filled with fluid. It contains the main organ of hearing, a coiled

tube called the cochlea. The vibrations make waves in the fluid of the cochlea. These waves produce the sound signals that are sent to the brain. The inner ear also has structures called the semicircular canals, which help to keep the body in balance.

Problems with the Ear

When people fly, drive in the mountains, or swim deep underwater, their ears may “pop.” This painful or stuffy feeling usually goes away on its own. Infections of the middle ear are a common problem in children. They often develop after a cold. Ear infections can be quite painful, but they are usually not serious. Serious problems with the inner ear can lead to deafness.

Ears of Other Animals

Ears are much more important to mammals than to other groups of animals. Only mammals have the outside ear parts called auricles. The ears of different mammals work basically the same way that human ears do. However, many

The huge auricles (outside ear parts) of a bat help it to tell from which direction a sound is coming.

mammals can move their auricles to pick up sound coming from any direction.

Other groups of animals have only some ear parts. Birds have an ear canal, a middle ear, and an inner ear. Their hearing is similar to that of humans. Most amphibians and reptiles have middle ears and inner ears with one bone. The eardrums of frogs and some reptiles are visible on the sides of the head. Snakes lack outer and middle ears. The snake's skull bones pass vibrations to the inner ear. Some fish have a simple inner ear buried deep in the head. Insects and spiders also lack ears, but they can sense vibrations in other ways.

Amelia Earhart

She flew from the island of Newfoundland to Ireland. Her flight lasted 14 hours and 56 minutes.

Earhart next made a series of flights across the United States. She wanted to get more women involved in aviation. She also wanted to make flying more popular as a way to travel. For a time Earhart worked for one of the first regular passenger services to fly between New York City and Washington, D.C.

In June 1937 Earhart set out from Miami, Florida, to fly around the world. She took along a navigator, Fred Noonan, to help her find the way. On July 2 their plane vanished over the Pacific Ocean. The U.S. Army and Navy and the Japanese navy sent out searchers. However, no one ever found the two fliers or their plane.

Did You Know?

In January 1935 Earhart made a solo flight from Hawaii to California. She was the first pilot to succeed on the dangerous route.

Earhart, Amelia

Amelia Earhart was a pioneer of aviation. She was the first woman to fly alone across the Atlantic Ocean. She disappeared during a flight in 1937 and was never found.

Amelia Mary Earhart was born on July 24, 1897, in Atchison, Kansas. Her family did not want her to be a pilot, but she learned anyway.

In 1928 Earhart became the first woman to fly across the Atlantic. She was a passenger in an airplane that someone else piloted. Four years later she became the first woman—and only the second person—to fly across the Atlantic alone.

Earth

Earth is one of the eight planets that orbit, or travel around, the sun in the solar system. It is the third planet from the sun. Earth travels around the sun at an average distance of about 93 million miles (150 million kilometers). It appears bright and bluish when seen from outer space.

Earth is the only planet in the solar system that can support life. Life is possible on Earth because the planet has water on its surface and oxygen gas in its air. Earth also has the perfect range of temperatures for life. It is not too hot, like Venus, and not too cold, like Neptune. The average temperature on Earth is about 60° F (16° C).

Physical Features

Earth is the fifth largest planet in the solar system. It is made up of three layers: the core, the mantle, and the crust. The core is the center of the planet. It is about 4,300 miles (6,900 kilometers) across. The core is very hot. The mantle covers the core. It is about 1,800 miles (2,900 kilometers) thick. The crust is Earth's thin, rocky outer layer. At its thickest the crust is about 19 miles (31 kilometers) thick. Plants, animals, and people live on the crust.

Land covers about 30 percent of Earth's surface. The land is divided into seven huge pieces called continents. These continents are Africa, Antarctica, Asia, Australia, Europe, North America, and South America.

The three layers of Earth are the core, the mantle, and the crust. The crust is the thinnest layer.

Water covers about 70 percent of Earth's surface. This water is in the form of oceans, rivers, lakes, and groundwater. The four major water bodies on Earth are the Arctic, Atlantic, Pacific, and Indian oceans. They surround the continents. Some water is frozen. For example, there are large ice sheets in the Arctic and Antarctic regions.

The layer of gases surrounding Earth is called the atmosphere. This is the air that living things breathe. Earth's atmosphere goes up to a few hundred miles above the surface. The atmosphere gets thinner as it gets farther from the surface. It contains mostly water vapor and the gases nitrogen (77 percent) and oxygen (21 percent).

As seen from outer space, Earth looks like a bright blue ball with swirling white clouds.

Orbit and Spin

Like all planets, Earth has two types of motion: orbit and spin. Its orbit is the path it takes around the sun. It takes Earth 365.25 days to go around the sun once. This is equal to one calendar year. The force that keeps Earth orbiting the sun is called gravity.

Earth also spins, or rotates around its axis. The axis is an imaginary line that runs through Earth's center from the North Pole to the South Pole. Earth completes one rotation in 24 hours. This is equal to one day.

Seasons

Earth's axis does not run straight up and down in relation to the sun. Instead it is tilted slightly. As Earth moves around the sun, the North Pole is tilted toward the sun for about half the year. During this time the northern half of the planet, called the Northern Hemisphere, gets more sunlight than the southern half, or the Southern Hemisphere. During the

other half of the year the North Pole is tilted away from the sun. Then the Southern Hemisphere gets more sun than the Northern Hemisphere.

These differences in how sunlight hits different parts of Earth cause the seasons. For example, the Northern Hemisphere has its warmest season, summer, when it is tipped closer to the sun. At the same time the Southern Hemisphere has winter, its coldest season.

Satellite

Earth has one natural satellite called the Moon. A satellite is an object in space that orbits another object of a larger size. The Moon is about 239,000 miles (384,000 kilometers) from Earth.

Earth Through Time

Scientists believe that Earth is about 4.6 billion years old. Earth's surface has changed greatly since it was first formed. Some changes have taken place over millions of years as wind and water have eroded, or worn away, the land. Erosion has created features such as the Grand Canyon. Other changes have happened very quickly. The force of an erupting volcano or an earthquake can change the surrounding land in just hours.

The scientists who study these changes are called geologists. They have divided Earth's history into time periods called eons and eras. They use these periods to explain how and when changes on Earth took place. For instance, geologists have found that the Atlantic Ocean was

Earth Day

Every April 22, people celebrate Earth Day to show how much they care about the planet. Many people use the day to do projects that will help Earth. Some meet to discuss how to limit pollution and how to save endangered animals and plants. Others plant trees, clean up parks and beaches, or set up recycling stations. In some places concerts and organized walks raise money for environmental groups.

Gaylord Nelson, a U.S. senator, founded Earth Day. He asked Denis Hayes, a college student, to organize the first

Volunteers clear overgrowth from a hill in an Earth Day clean-up effort.

Earth Day events. About 20 million Americans celebrated the first Earth Day in 1970. The day made more Americans aware of the damage that people had done to the environment. In 1990 Hayes organized the first International Earth Day. About 200 million people in 141 countries took part.

Pollution • Recycling

Earthquake

In an earthquake, huge masses of rock move beneath Earth's surface and cause the ground to shake. Earthquakes occur constantly around the world. Often they are too small for people to feel at all. Sometimes, however, earthquakes cause great losses of life and property.

Causes

Most earthquakes are caused by changes in Earth's outermost shell, or crust. The crust is not a solid mass. Instead it is made up of about a dozen rock masses called plates that are constantly moving. In different places they move apart, collide, or slide past each other. Over time this movement causes great pressure to build up. When the pressure becomes too great, the rock masses suddenly shift along a crack in the crust, called a fault.

The shifting rocks release energy in the form of shock waves. The waves spread through the rock in all directions, causing an earthquake. In the most powerful quakes, people thousands of miles away

Did You Know?

The San Andreas Fault in southern California is about 650 miles (1,050 kilometers) long. It can easily be seen from above the ground.

Two Types of Ground Movement

In an earthquake, the ground can move up and down. It can also move sideways.

from the center of the quake can feel the ground shake.

A small number of earthquakes have other natural or human causes. The movement of molten rock beneath a volcano can trigger an earthquake. The pressure resulting from holding vast amounts of water behind large dams can cause minor quakes. So can underground nuclear explosions and the digging of mines.

Effects

An earthquake may be powerful enough to change the surface of Earth, thrusting up cliffs and opening huge cracks in the ground. Earthquakes can do great damage to buildings, bridges, railroads, and other structures. The violent shaking

during earthquakes often causes other Earth movements, such as avalanches. Some quakes happen in or near oceans. These quakes can cause huge, destructive waves called tsunamis to sweep ashore.

Where Earthquakes Occur

Most earthquakes take place along the boundaries of Earth's crustal plates. One great earthquake belt circles the Pacific Ocean along the mountainous west coasts of North and South America and runs through the island areas of Asia. It is known as the ring of fire. The famous San Andreas Fault of California is part of this belt.

A second, less-active belt is between Europe and North Africa in the Mediterranean region and includes portions of Asia. A small number of quakes occur in the interior of plates rather than along the edges.

An earthquake in Japan was powerful enough to destroy an elevated expressway.

Measuring Earthquakes

Scientists record the shock waves produced in an earthquake with an instrument called a seismograph. They measure the strength of a quake in different ways. The Richter scale measures earthquakes based on the amount of energy they release. The weakest earthquakes are close to zero on the scale; the strongest measure about 9. The Mercalli scale measures the amount of destruction caused by an earthquake on a scale of 1 to 12.

Easter

Easter is the holiest day of the year for Christians. It celebrates their belief in the resurrection, or the rising from the dead, of Jesus Christ. Jesus was the founder of the religion of Christianity. Easter is always observed on a Sunday in the Spring, but its date varies.

The week before Easter Sunday is known as Holy Week. During this week, Christians remember the events they believe took place at the time of Jesus' death. Palm Sunday recalls the entrance of Jesus into Jerusalem shortly before his death. Holy Thursday marks the Last Supper of Jesus with his disciples, or followers. Good Friday remembers the crucifixion, when Jesus was killed by being nailed to a cross. Christians believe that Jesus was resurrected on the

Christians attend an Easter service at sunrise near the Grand Canyon in Arizona.

third day after his death. Easter is therefore a celebration of new life.

On Easter, Christians attend special church services. A number of popular folk customs are also associated with Easter. These have to do with rabbits and colored eggs, which are ancient symbols of new life. In some countries children color eggs and then the eggs are hidden for them to find. According to tradition the Easter Bunny also leaves eggs and candy for children on Easter morning.

Christianity

Eastern Orthodox Churches

Eastern Orthodoxy is one of the main branches of Christianity. Eastern Orthodoxy consists of a group of churches,

Some Eastern Orthodox churches have onion-shaped domes.

most of which are associated with a particular country. The patriarch, or leader, of Constantinople (present-day Istanbul, Turkey) is the general representative of Eastern Orthodoxy. But each church is independent and selects its own head. There are more than 200 million Orthodox Christians in all.

Beliefs and Practices

The Orthodox Christians trace their history back to the beginnings of Christianity. They believe that they follow Christianity in the same way that the first Christians did. Unlike Roman Catholics, they do not recognize the authority of the pope.

Every Sunday, Orthodox churches celebrate their most important service, the Divine Liturgy. During the service, church members eat bread in memory of Jesus' Last Supper. As in other Christian churches, this is known as Communion. It is one of the seven sacraments, or holy ceremonies, of the Orthodox church.

History

Christianity became the official religion of the Roman Empire in the AD 300s. In the 400s the western part of the empire fell to invaders. But the eastern part survived for another 1,000 years as the Byzantine Empire. The pope emerged as the leader of the Western church, and the patriarch of Constantinople became the head of the Eastern church.

The Eastern and Western churches disagreed on several issues. They grew apart over several centuries and finally officially separated in 1054. They came to be called the Eastern Orthodox churches and the Roman Catholic church.

Muslim Turks conquered the last part of the Byzantine Empire in 1453. The Russian church, which was outside the empire, was the only Orthodox church that remained free of Turkish rule. It thus took a leadership role among the Orthodox churches.

East Indies

The East Indies is the world's largest island group. It is sometimes known as the Malay Archipelago. The East Indies includes the Moluccas, which were once fabled as the Spice Islands.

The islands extend for more than 3,800 miles (6,100 kilometers). They lie between the Asian mainland in the

north and west and Australia to the south. The term East Indies has been used at different times to refer to different sections of these islands. In a general sense the term East Indies includes all of the islands in the area, as well as all of mainland Southeast Asia and India.

More specifically, the group consists of the more than 13,000 islands that make

up Indonesia, parts of Malaysia, Brunei, and Papua New Guinea. The islands of the Philippines are also sometimes included in the East Indies.

The East Indies were famous for their spices at least 4,000 years ago. For many years spices were considered very valuable. People traveled far to buy and sell them, and important cities started as trading centers. Europeans looking for new routes to the East Indies discovered the lands of the Americas. For centuries European powers also fought over the riches of the East Indies. They took control of much of the area and established colonies there. No European colonies remain in the East Indies today, however.

East Timor

East Timor is one of the world's newest countries. Its capital is Dili.

Geography

East Timor covers the eastern half of the island of Timor in Southeast Asia. The western half is part of Indonesia. East Timor also includes an area called Ambeno (on the northwestern coast of Timor) and two small islands.

East Timor is mountainous and dry. Sandalwood trees grow in hilly areas. Shrubs, grass, coconut palms, and eucalyptus trees grow in the lowlands. Wildlife includes monkeys, deer, civet cats, snakes, and crocodiles.

People

Most of the people of East Timor have Southeast Asian or South Pacific roots. Christianity is the chief religion. The major languages are Tetum, Portuguese, Indonesian, and English.

Economy

Most of the people of East Timor work as farmers. Important crops include corn, rice, cassava, sweet potatoes, and coconuts. The country also produces

East Timorese girls perform a traditional dance in Manatuto, East Timor.

coffee, livestock, and clothing. Supplies of oil and natural gas lie offshore.

History

Little is known of Timor's early history. The Portuguese settled on the island in 1520. The Dutch also claimed part of the island, and the two countries fought for control for many years. Portugal gained firm control over East Timor by 1914. In 1975 East Timor declared its independence. However, Indonesia soon invaded.

In 1999 Indonesia allowed East Timor to vote for or against independence. The voters chose independence, but armed groups that opposed it killed hundreds and left the country in ruins. The United Nations stepped in to keep peace as East Timor set up a government. In 2002 East Timor became an independent republic.

Echidna

Echidnas are unusual mammals. Along with their relative the platypus, echidnas are the only living mammals that lay eggs. Echidnas are also called spiny anteaters.

There are three species, or kinds, of echidna. The short-nosed echidna is common in Australia and on the island of Tasmania. Two species of long-nosed echidna live only on the island of New Guinea.

Echidnas are stocky animals with a short tail. They have brownish fur with spines sticking through. Their feet have strong claws that are good for digging. They have a very small mouth and a long, sticky tongue. The short-nosed echidna is about 12 to 18 inches (30 to 45 centimeters) long. It has a straight snout that points forward. The long-nosed echidnas are usually 18–31 inches (45–78 centimeters) long. They have a longer, downward-pointing snout.

The short-nosed echidna eats ants and termites that it catches with its long, sticky tongue. Long-nosed echidnas eat mostly earthworms.

A female echidna usually lays a single leathery egg. The mother holds the egg in a pouch on her body. It hatches about 10 days later. The newborn lives in the pouch for about two months. The baby sucks milk through special hairs on the mother's body. The young echidna goes

Eclipse

An eclipse happens when one object in space blocks another from view. For example, during a solar eclipse the Moon comes between Earth and the sun. The Moon blocks the sun for a time so that people on Earth cannot see it.

In ancient times solar eclipses caused great fear and wonder. People did not understand why the sky sometimes darkened in the middle of the day. Today scientists understand why eclipses happen and can determine when they will occur.

Eclipses happen because planets, moons, and other objects constantly move through space. For instance, Earth travels around the sun in a path called an

During a solar eclipse the Moon passes between the sun and Earth. During a lunar eclipse Earth passes between the sun and the Moon.

orbit. As Earth moves around the sun, the Moon makes its own orbit around Earth. An eclipse involves three space objects temporarily lining up in a row.

Solar Eclipses

In a solar eclipse the Moon passes between the sun and Earth. This prevents the sun's light from reaching Earth. As the Moon passes in front of the sun, the Moon's shadow sweeps across Earth. The sky gradually grows darker.

If the sun's light is completely blocked, the Moon appears as a black circle. What looks like a ring of fire appears around the circle. This ring is the corona, or the gases that surround the sun.

Earth and the Moon keep moving. After a few minutes the sky begins to lighten again.

A solar eclipse is called total if the sun appears totally dark. If only part of the sun appears dark it is a partial eclipse. During an eclipse some people on Earth will see a total eclipse, others will see a partial eclipse, and many others will not notice any difference in the sun. Only the people within the small area covered by the center of the Moon's shadow will see a total eclipse. People just outside of that area will see a partial eclipse.

Looking directly at any solar eclipse can seriously hurt one's eyes. It should never be attempted.

Lunar Eclipse

The Moon does not make any light itself. Rather, the sun shines on the Moon, and the reflected sunlight makes the Moon visible from Earth.

During a lunar eclipse Earth blocks sunlight from reaching the Moon. The sun, Earth, and the Moon line up, with Earth

The sun's corona shines brightly around the Moon during a total solar eclipse.

in the middle. The Moon is then in Earth's shadow. But the Moon does not appear completely dark. Instead, it glows a dim orange or red color. This is because some light reaches the Moon indirectly. This light bounces off the gases surrounding Earth and then hits the Moon.

Lunar eclipses can be total or partial. Unlike a solar eclipse, a lunar eclipse is safe to view directly.

Ecology

Ecology is the study of the relationships between living things and their surroundings, or environment. Scientists who work in ecology are called ecologists. Ecologists examine how living things depend on one another for survival. They also study how living things use such natural resources as air, soil, and water to stay alive.

Some ecologists work in laboratories. Laboratory experiments allow ecologists to study things under controlled conditions. For instance, they can experiment to see how plants react to different amounts of light or water. Such studies are harder in a natural setting because weather and other natural conditions cannot be controlled.

However, many ecologists do work in natural, outdoor settings. They look at all the different factors that affect ecosystems, or communities of living things.

An ecologist studies pitcher plants as they grow in a nature preserve in North Carolina.

Studies in the outdoors are useful because they show what is actually happening in the environment.

Ecology is important because it shows how changes in the environment affect the survival of living things. For example, when pollution kills certain living things, the animals that feed on them also may die. The work of ecologists has convinced many people to protect the environment and all the ecosystems that it supports.

Economics

Economics is the study of the economy, or the part of a society that creates wealth. Wealth is not just money. Wealth comes from the production of goods and services, which people buy with money. People who study economics, called economists, look at how

people create wealth, how they use it, and how different people get different amounts of it.

Parts of an Economy

A society creates wealth by producing goods and services. Goods include such objects as apples, cars, and roads. Services are things that people do for others, such as gymnastics lessons, banking, and dental care. People who buy these goods and services are called consumers.

The process of creating the goods and services is called production. There are three major factors in production. The first is land. Land can mean a large farm or a tiny workshop. Land also includes natural resources like oil and minerals. The second factor of production is labor, or people who work for pay. Workers may be rewarded with wages, or—if they own the business—with profits. (Profits are the money that a business keeps after paying costs.) The third factor of production is capital. This includes the tools, factories, and

offices that are used to make the goods and services.

All the companies producing a particular kind of product or service are grouped together in what is known as an industry. Industries that make things are called manufacturing industries. Industries that sell services are called service industries.

Branches of Economics

There are several different branches of economics. The study of individual consumers and businesses is called microeconomics. The study of how a whole country's economy works is called macroeconomics.

Microeconomics

Economists who study microeconomics look at how consumers spend their money. They try to explain why consumers buy one product rather than another. They also look at why companies choose to produce one good or service rather than another.

The amount consumers want to buy is called demand. The amount companies produce is called supply. Price strongly affects supply and demand. If a manufacturer charges a high price for a product, usually it will sell few products. If it reduces the price, usually it will sell more products.

Macroeconomics

Economists who study macroeconomics look at the value of all the goods and

The economics of supply and demand sets the prices in a village market.

services that a country produces. In this way, they measure a whole country's wealth.

Governments are interested in macroeconomics, too. A government plays an important role in its country's economy. When a government decides which goods and services should be produced and sold, the economy is said to be planned. Countries with socialist or Communist governments usually have planned economies.

By contrast, when a government lets companies and consumers decide what will be produced, the economy is called a free market. Countries with capitalist governments have free-market economies. But even capitalist governments affect the economy. They do this by raising or lowering taxes and changing the amount banks can charge for loans. These actions cause people to have more or less money to spend on goods and services.

• Manufacturing • Money • Socialism

Ecosystem

An ecosystem is a group of plants, animals, and other living things that live in the same surroundings. An ecosystem also includes nonliving materials—for example, water, rocks, soil, and sand. A swamp, a prairie, an ocean, and a forest are examples of ecosystems.

A swan builds a nest in a wetland ecosystem in England.

Each living thing in an ecosystem has a role to play—as a producer, a consumer, or a decomposer. Green plants are producers. They make their own food through a process called photosynthesis. Animals, including humans, are consumers. They eat, or consume, plants or other animals. Bacteria and other living things that cause decay are decomposers. They break down the waste products and dead tissue of plants and animals. They return nutrients to the soil. The way that producers, consumers, and decomposers provide nutrients for one another is called a food chain.

An ecosystem's health depends on a delicate balance among all its members and the environment. If something disturbs the balance, the ecosystem and all its members may suffer. Natural things such as a changing climate can disturb ecosystems, as can human activities such as polluting.

Ecuador

Ecuador gets its name from the equator, which passes through the northern part of the country. Located in northwestern South America, Ecuador straddles part of the Andes Mountains and occupies part of the Amazon River basin. The capital city, Quito, stands on the lower slopes of an old volcano.

Geography

Ecuador is bordered by Colombia, Peru, and the Pacific Ocean. Its territory includes the Galápagos Islands, which lie to the west.

Along the coast the land is flat, with tropical rain forest in the north and desert in the south. Two ranges of the Andes Mountains run from north to south through central Ecuador. The highest peak is Chimborazo, at 20,702 feet (6,310 meters). Between the ranges are fertile valleys and plateaus. East of the Andes, rain forests grow in the basin

of the Amazon River. In this region the Napo River flows toward Peru.

Most of Ecuador has a hot, humid climate year-round. The mountain regions are cooler, and the highest peaks are snowcapped.

Plants and Animals

Palms grow in the central part of Ecuador's coast. The coastal region is also the agricultural center of the country. The mountains have some evergreen forests as well as grasses at higher elevations. Logging has threatened many of Ecuador's rain forests.

In the rain forests live monkeys, jaguars, ocelots, foxes, weasels, otters, skunks, raccoons, coatis (relatives of the raccoon), and tree-dwelling mammals called kinkajous. The Galápagos Islands are known for their unusual animal life, including giant tortoises and marine iguanas.

People

More than 40 percent of Ecuadorans are mestizos—people with mixed European and American Indian roots. Almost the same number of people are American Indians. Whites, blacks, and Asians form smaller groups. Most people are Roman Catholics. Spanish is the official language, but many Indians speak Quechua or Shuar.

Most Ecuadorans live in cities along the coast or in the mountains. Very few

Cotopaxi is an active volcano in the Andes Mountains of Ecuador.

people live in the eastern part of the country.

Economy

Ecuador's economy depends on natural resources and agriculture. The country produces mainly oil, bananas, and shrimp. Other important products include sugarcane, palm oil, rice, corn, cut flowers, and canned fish. In recent years manufacturing has increased in Ecuador. Factories make tires, textiles, and other items.

History

The land now known as Ecuador had a long history before the arrival of Euro-

peans. People there made pottery figures as early as 3000 to 2500 BC. In the AD 1400s the Inca of what is now Peru conquered the area. They ruled until Spain invaded in 1534. The Spanish built huge estates and forced the Indians to work on them.

With help from Simón Bolívar, Ecuador won its independence from Spain in 1822. It joined Colombia and Venezuela to form the Republic of Colombia, called Gran Colombia. Bolívar served as its president. Ecuador left the republic in 1830 and became an independent country.

Since independence Ecuador has had many changes of government. Because of the constant change, it has been difficult for Ecuadorans to make progress. However, Ecuador solved one long-standing problem in 1998, when the president signed a peace treaty with Peru. The two countries had been fighting for many years over part of their shared border.

Edinburgh

Population
(2006 estimate)
464,000

Edinburgh is the capital of Scotland, one of the four main parts of the country called the United Kingdom. The city is known as a place of learning. Through the years it has produced many great thinkers and writers.

Cityscape

Edinburgh is built on a series of hills and rocky ridges. It has a port on a part of the North Sea.

Edinburgh Castle is one of Scotland's most popular tourist attractions.

The oldest section of Edinburgh is called the Old Town. It developed around Castle Rock, which rises high above a valley floor. At its top stands Edinburgh Castle, the home of Scottish kings and queens in ancient times.

Edinburgh's other main section is the New Town. Despite its name, it is more than 200 years old. Today it is the city's main business area.

Economy

Edinburgh is a major center of banking and law. Other services, such as education, health care, trade, and tourism, are also important.

History

People have lived in the Edinburgh region for thousands of years. What is now called the Old Town dates back to the 1000s.

Edinburgh became Scotland's capital in the 1400s. Scotland was then an independent kingdom. It became part of the United Kingdom in 1707.

In the 1700s Edinburgh became a great cultural center. Many important philosophers, writers, and scientists lived there. It was also the birthplace of the *Encyclopædia Britannica*.

Edinburgh's New Town was built in the late 1700s and early 1800s. The city grew greatly over the next century.

Scotland began to govern most of its own affairs again in 1999. Scottish law-

makers began meeting in Edinburgh once more.

Edison, Thomas Alva

Thomas Edison was called a “wizard” because of his many important inventions. He created more than 1,000 devices on his own or with others. His best-known inventions include the phonograph (record player), the lightbulb, and motion-picture equipment.

Thomas Alva Edison was born on February 11, 1847, in Milan, Ohio. He experienced hearing loss at an early age. He was an imaginative and curious child. He did poorly in school, though,

Thomas Edison poses with a phonograph that recorded sound on sheets of tinfoil.

perhaps because he could not hear his teacher. His mother then educated him at home.

When Thomas was a teenager he became a telegraph operator. Telegraphy was one of the nation’s most important communication systems at the time. Thomas was good at sending and taking messages in Morse code. He loved tinkering with telegraphic instruments, and he developed several improvements for them. By early 1869 he had quit his telegraphy job to become a full-time inventor.

Edison built research laboratories at Menlo Park and West Orange, New Jersey. He later created companies that produced and sold his successful inventions.

Although most of his life was devoted to his work, Edison’s family was also important to him. He married twice and had six children. Edison died on October 18, 1931.

Education

Education is the process of gathering information about the world and oneself. Formal education is learning that takes place in schools or with private teachers. People also learn from their families, with friends, while traveling, and in many other places. This is called informal education.

Did You Know?

Edison also worked to develop the electric power systems that bring electricity into homes and businesses.

Education gives students the answers to many questions.

Formal Education

Many children around the world go to free, public schools. Others go to private schools, which charge tuition, or fees. Some study at home with parents, which is called home schooling. Some have tutors, or private teachers.

Different countries provide different levels of formal education. In the United States formal education starts with pre-school and kindergarten. At about age 6, children begin primary school, which is also called grade school or elementary school. Some communities have middle schools or junior high schools for students between 11 and 14 years old. High school, or secondary school, lasts from about age 14 until about age 18.

Many students continue their education after high school. Some attend trade schools or community colleges. Others go to state colleges and universities. Some go to private colleges and universities.

Adults who have finished their formal education can continue their education at night or on weekends. The courses they take are known as continuing education or adult education classes.

History

In the earliest times children got their education directly from parents and other adults. They learned mainly skills for survival.

Eventually people established cities and advanced civilization. As societies developed they set up schools to teach reading, writing, arithmetic, and other subjects.

The first schools were usually just for boys. Most of the students came from rich and powerful families. Often the purpose of their education was religious training.

Some schools had other purposes as well. Many schools focused on military training. Sometimes youths attended special schools to learn the art of public speaking. These skills were meant to help them become future leaders.

Most girls received their education at home. They learned cooking, sewing, and other useful skills.

Over time education became available to more people, not just the rich and powerful. The governments of some countries set up public systems of education in the 1800s. More schools opened to girls.

An African student uses a pointer and blackboard.

In the United States many early schools had only a single room and one teacher. Children of every age learned together. In 1751 Benjamin Franklin founded a secondary school—the first of many. Students studied such subjects as history, mathematics, and navigation. In the 1800s free elementary and secondary schools opened across the United States.

During the 1900s, as education became more important, teachers colleges opened. The requirements for becoming a teacher became stricter. Teaching became a highly respected profession.

Eel

Eels are fishes that look like snakes. There are hundreds of different species,

or types, of eel. They belong to a large group of fishes called the eel order.

Where Eels Live

Many species of eel live in warm, salty seas and oceans. Morays and congers are two well-known types of marine, or sea, eel. Freshwater eels live in rivers, lakes, and ponds on almost every continent. They travel to saltwater to reproduce.

Physical Features

Adult eels range in length from 4 inches (10 centimeters) to 11.5 feet (3.5 meters) long. An eel has a pointed head, sometimes with a wide mouth and sharp teeth. A fin runs along the back and around the tip of the tail. The body is usually smooth. Deep-sea eels are often black or gray. Eels that live in tropical reefs may have bright colors and patterns.

The American and European eels live in freshwater. Congers are marine, or sea, eels.

Behavior

Many species of eel hide in mud or among rocks during the day. They come out at night to hunt for food. Eels eat shrimps, snails, fishes, mussels, and worms.

Eels generally live alone. But garden eels live in colonies of hundreds of eels. Each garden eel hides in a tube that it digs in the sandy ocean floor.

Eels breathe through gills, as other fishes do. But freshwater eels also can absorb oxygen through their skin. This allows them to move across land.

Life Cycle

Baby eels, or larvae, hatch from eggs in the ocean. The larvae are typically flat and transparent. After a period of growth, they go through metamorphosis. This is a series of changes that turn the larvae into young eels, or elvers. Elvers look like miniature adult eels.

After the elvers reach adulthood, they are ready to mate. Most species migrate, or travel, to a particular area to mate and lay eggs.

Fish • Metamorphosis

Egg

The young of most animals grow from eggs. Only female animals make eggs. Male animals make cells called sperm. A sperm must join an egg before the egg can grow into a new animal.

Some insects, such as ladybugs, lay their eggs on plant leaves or stems.

In most mammals, the egg is just a cell, called an ovum, inside the mother's body. A sperm cell joins with the egg cell in a process called fertilization. The fertilized egg grows and develops inside the mother until the baby is ready to be born. Most other female animals lay eggs, or release them outside their body to develop.

Eggs need protection while the young develop inside them. Fish eggs often float in a protective jelly. Bird and reptile eggs have an outer shell. In bird eggs the shell is hard; in reptile eggs it is tough and elastic. Eggs with shells contain an egg cell and food, called yolk, for the developing young, called an embryo.

Many animals, including humans, eat the eggs of other animals. Fish eggs, called roe or caviar, are common in Japanese food. People around the world eat bird eggs, especially those of chickens and ducks.

Did You Know?

Scientists consider the fish called electric eels to be different from true eels. Electric eels live in South American waters.

Egypt

The Arab Republic of Egypt is a country in the northeastern corner of Africa.

Ancient Egypt was one of the earliest and most important civilizations in the world. The modern country plays a key role in Middle Eastern politics. Egypt's capital is Cairo.

Geography

Egypt shares borders with Libya, Sudan, Israel, and the Palestinian territory of the Gaza Strip. Egypt's northern coast is on the Mediterranean Sea, and its eastern coast is on the Red Sea. The Nile River flows northward into the Mediterranean. It fans out into the Nile delta, a triangular area at the mouth of the river.

The Nile divides Egypt into the Western Desert and the Eastern Desert. The Western Desert is low-lying and generally flat. The Eastern Desert has rolling hills and mountains in the southeast. To the northeast is the Sinai Peninsula, the only land bridge between Africa and Asia. The Suez Canal separates Sinai from the rest of Egypt.

Egypt has only two real seasons: a cool, mild winter and a hot summer. The climate is very dry and sunny.

Plants and Animals

The Western Desert has very few plants. The Eastern Desert and Sinai have thorny shrubs, small desert plants, and herbs. The acacia is one of the few native trees. Around the Nile are date palms

and many water plants, including reeds and grasses.

Egypt's wild animals include mountain sheep and goats, gazelles, miniature desert foxes, hares, jackals, and mon-gooses. Rodents, insects, lizards, and snakes are also common. Many types of birds live in Egypt year-round or pass through on their migrations.

People

Most Egyptians are descendants of the Hamites of ancient Egypt and of the Arabs who migrated to Egypt centuries ago. Other groups include Nubians, Roma (Gypsies), Armenians, and Greeks. Arabic is the official language, and Islam is the official religion. About 15 percent of Egyptians are Christians, mostly members of the Coptic Orthodox Church. Egypt also has a small Jewish community. Almost all Egyptians

Muslims kneel in prayer on a street in Cairo.

live in the Nile valley and delta. More than half of the people live in rural areas.

Economy

Mining and manufacturing are important parts of Egypt's economy. The country mines petroleum (oil) and natural gas. It produces valuable crude oil, cotton goods, processed foods, chemicals, iron, and steel.

About one fourth of workers are farmers. Much of Egypt's farming income comes from cotton and rice, which it sells to other countries. Other crops include sugarcane, corn, tomatoes, wheat, potatoes, oranges, dates, and grapes.

Tourism is also very important to the economy. Visitors come to see the Great Pyramids at Giza, the Sphinx, and other monuments of ancient Egypt.

History

Native kings and queens ruled in ancient Egypt for most of the country's first 2,500 years, from about 2925 BC until 332 BC. In 332 BC Alexander the Great, the king of Macedonia, invaded Egypt. Macedonians ruled Egypt until 30 BC, when it fell to the Romans. (For more information about Egypt's early history, *see* Egypt, Ancient.)

Arabs conquered Egypt in AD 642.

Within a few hundred years, Egypt was transformed into an Arabic state. The people gradually converted from Christianity to Islam.

Ottoman Rule and British Control

In 1517 the Turkish Ottoman Empire took control. Future emperor Napoleon I of France invaded in 1798, but the Ottomans soon regained power. Muhammad 'Ali, an officer in the Ottoman army, became governor of Egypt in

Men ride camels near the three pyramids of Giza in Egypt.

TIMELINE

Alexander the Great invades Egypt.

332 BC

Arabs conquer Egypt.

AD 642

Great Britain occupies Egypt.

1882

Egypt becomes a republic.

1953

Rome takes control of Egypt.

30 BC

Egypt becomes part of the Ottoman Empire.

1517

Egypt gains independence.

1922

1805. He introduced many reforms in order to modernize the country. Members of 'Ali's family governed Egypt for more than 100 years.

Egypt allowed a French company to build the Suez Canal in 1859–69. British troops occupied Egypt in 1882, and in 1914 the British made Egypt a British protectorate, or dependent state.

Independence

In 1922 Egypt gained independence. In the 1940s it helped to found the Arab League, a union of several Arab countries. The league became involved in the growing disputes between Arabs and Jews in neighboring Palestine. In 1948, after part of Palestine became the country of Israel, Egypt and its Arab allies attacked Israel but were defeated.

A military group overthrew Egypt's king in 1952. Gamal Abdel Nasser became the first native Egyptian ruler in more

than 2,000 years. In 1953 Egypt became a republic. Nasser wanted Egypt to be a leader in the Arab world. During this period tensions increased between Egypt and Israel.

Anwar el-Sadat became president in 1970. In 1973 Egypt fought another brief war with Israel, but in 1978 Sadat met with the Israeli prime minister, Menachem Begin, in the United States. The meeting led to a historic peace treaty between Egypt and Israel in 1979. Most other Arab countries were unhappy with the treaty. Muslim radicals assassinated Sadat in 1981.

Under a new president, Hosni Mubarak, Egypt's relations with other Arab countries improved. Egypt continued to work for peace in the Middle East.

Egypt, Ancient

About 5,000 years ago, the civilization of ancient Egypt began in the Nile River valley of northeastern Africa. It was one of the world's first civilizations. It is also one of the most famous civilizations in history. The ancient Egyptians built huge pyramids, temples, palaces, and tombs. Their paintings and carvings are among the most splendid ever created. They also produced art with simple scenes of everyday life, work, and play that shows many details of their lives.

Egypt's dry climate has helped to preserve many of the things that the ancient Egyptians made. Archaeologists first started to uncover the remains of ancient Egypt in the late 1700s. Through those remains historians have been able to learn a great deal about the world of the ancient Egyptians.

Many ruins from ancient Egypt can still be seen today. The temple of Abu Simbel was built during the reign of Ramses II almost 3,300 years ago. It was dedicated to two sun gods.

Life in Ancient Egypt

Villages and towns of ancient Egypt were situated near the Nile River. It was the chief highway as well as the only source of water. Very little rain falls in Egypt. Rain does fall along other parts of the river, however. Every year the water from that rain flows downstream and eventually floods the lands. Afterward, as the waters flow back, they leave rich mud behind. The Egyptians planted wheat and barley in the mud. They grew other fruits and vegetables using irrigation (channels of water).

Ancient Egyptian houses were made of mud bricks. The houses had small windows and floors of straw matting. Paintings often decorated the walls.

Clothing was simple because the climate was hot. White linen, woven from the flax plant, was a common fabric. Men typically wore a skirt of linen and sometimes a vest. Women wore a straight, simple, ankle-length dress.

One of the ancient Egyptians' finest achievements was their written language. The first Egyptian writing was a system of pictures called hieroglyphics. The Egyptians were using hieroglyphics by 3100 BC. The Egyptians cut or painted the symbols on the walls of tombs and temples. Later they developed simpler, curved forms of writing. The Egyptians used these forms to write on papyrus, a paper-like material made from a plant.

The ancient Egyptians worshipped many gods. The main god of the sun was Re (or Ra). Each city had its own special gods. When the city of Thebes

grew in importance, its special god Amon did also. Eventually the Egyptians combined Amon with Re. Amon-Re was considered the king of the gods.

Osiris, a god of the dead, was another important god because the Egyptians believed in life after death. Wealthy Egyptian families stocked tombs with items that they thought dead people would use in the next life.

In addition, the Egyptians used salt and chemicals to preserve dead bodies as mummies. They even made mummies of such animals as cats, ibises, and crocodiles. Mummies of important people lay in fancy coffins called sarcophagi. The coffin of King Tutankhamen was made of solid gold.

History

Earliest Egypt

People have lived along the banks of the Nile River for at least 10,000 years. The narrow valley of the Nile was once swampy and overgrown with trees, rushes, and papyrus (a tall, reedlike plant). The people gradually cleared the swamps and built villages. They learned to plant and grow crops. Eventually, they organized two kingdoms. Upper Egypt was in the narrow river valley in the south. Lower Egypt was in the north, in the broad delta (triangular piece of land) where the river flows into the sea.

In about 2900 BC a king named Menes united the two parts of Egypt. Menes

A tomb from ancient Egypt is painted with hieroglyphics and many colorful pictures. The pictures give an idea of what people at the time looked like and what kind of clothing they wore.

Nefertiti was queen of ancient Egypt from 1353 to 1336 BC. A painted stone bust, or statue of the queen's head, can be seen in the Egyptian Museum in Berlin.

built the capital city of Memphis. The site of Memphis is near Cairo, the capital of modern Egypt.

Old, Middle, and New Kingdoms

After Menes, many kings, called pharaohs, ruled ancient Egypt. During the long history there were more than 30 dynasties, or ruling families, of pharaohs. Historians have grouped several of these dynasties into three important periods: the Old Kingdom, the Middle Kingdom, and the New Kingdom. These existed from about 2600 to 30 BC.

The Old Kingdom lasted from 2575 to 2130 BC. It was during this period that the Egyptians built their great pyramids. Near the great pyramids, the Egyptians made a huge sculpture called the Great Sphinx. The Sphinx has the face of a man and the body of a lion.

After 2130 BC Egypt suffered civil wars. The country was split up until about 1938 BC. Then the rulers of Thebes, a city far up the Nile in Upper Egypt, defeated their enemies and reunited Egypt. This began the Middle Kingdom, which lasted until 1630 BC. During this time, Egypt expanded its territory.

A second period of weakness followed the Middle Kingdom. An Asian people known as the Hyksos invaded Egypt. The Egyptians finally forced out the Hyksos by 1539 BC. This began the New Kingdom, which lasted until 1075 BC.

A mighty pharaoh of the New Kingdom was Thutmose III, who ruled from 1479 to 1426 BC. Thutmose's reign was the time of ancient Egypt's greatest power and wealth. Thutmose conquered Syria. He also ordered the building of many tombs and temples.

Later during the New Kingdom, the Hebrews (the ancestors of Jewish people) left Egypt, where they had been slaves. This event, called the Exodus, probably took place between 1279 and 1213 BC, during the reign of Ramses II.

Alexander and the Ptolemies

Peoples from Asia, first Assyrians and then Persians, later took over Egypt.

Then in 332 BC Alexander the Great of Macedonia (a country near Greece) conquered Egypt. He founded the city of Alexandria at the mouth of the Nile.

After Alexander's death, Ptolemy, one of his generals, seized the throne. In 323 BC Ptolemy founded a new dynasty of Egyptian kings, called the Ptolemies. The Ptolemies were Macedonians who spoke Greek, and many Egyptians disliked having foreign rulers.

Nevertheless, under the Ptolemies Egypt grew rich and powerful. They built the Pharos, a huge lighthouse, at Alexandria. Like the great pyramids, the Pharos was one of the seven wonders of the ancient world. The Ptolemies also built a famous library at Alexandria. Scholars came from all over the Greek-speaking world to study there.

Roman and Muslim Conquests

The last of the Ptolemies was Queen Cleopatra. Roman forces defeated her navy at the battle of Actium in 31 BC. In 30 BC Egypt lost its independence to Rome. After the Roman Empire split in half in the AD 300s, Egypt became a part of the eastern half, called the Byzantine Empire.

Finally, in the AD 600s Muslim Arabs took over Egypt. Egypt is still a Muslim country today.

Eiffel Tower

The Eiffel Tower is the tallest structure in Paris, France.

The Eiffel Tower in Paris, France, is among the most famous landmarks in the world. Known as the Tour Eiffel in French, the tower was designed and built by the French engineer Gustave Eiffel in 1889.

The three-level tower is 984 feet (300 meters) tall. Glass-walled elevators and stairs lead up to the first and second platforms. Other elevators go from the second level to the third platform near the top. Along with viewing areas, the tower has restaurants, a museum, and a souvenir shop.

The Eiffel Tower is the result of a contest held by the French government. At the time the government was organizing a fair to celebrate the 100-year anniversary of the start of the French Revolution. Eiffel's plan was chosen from more

than 100 plans, though many people criticized the plan because nothing like it had ever been built before.

After the fair ended, the Eiffel Tower was almost torn down several times. But Eiffel oversaw changes to the structure that made it more useful. Among them were the additions of a weather station in 1890 and a military telegraph station in 1903. The tower is now a popular tourist attraction.

French Revolution

Einstein, Albert

Albert Einstein was one of the greatest geniuses in the history of science. He developed many theories, or ideas. These theories led to new ways of thinking about space, time, matter, energy, and gravity.

Albert Einstein

Early Life

Albert Einstein was born to Jewish parents in Ulm, Germany, on March 14, 1879. He did not do well in school, but he did take an interest in mathematics and science. While at college, he studied physics and math. After graduating in 1900, he worked in a government office. Meanwhile, he continued studying physics on his own.

Scientific Breakthroughs

In 1905 Einstein caused a stir by publishing five major research papers. These papers forever changed the way people thought about the universe. One of these papers contained completely new ideas about the properties of light. Einstein received the Nobel prize for physics in 1921, mainly for the work in this paper.

In another paper, Einstein presented what is now called the special theory of relativity. This theory states that measurements of space and time are relative. That is, they change when taken by people moving at different speeds. This idea was entirely new. The special theory of relativity also changed how scientists thought about energy and matter. (Matter is everything that takes up space.)

Later Years

When the Nazi Party took over Germany in 1933, Einstein left the country. He eventually settled in the United States.

During World War II Einstein urged the United States to build nuclear weapons.

He felt that these weapons might be needed to defeat the Nazis. The United States did create the first atomic bomb in 1945. Einstein, however, did not work to develop the bomb. After World War II he tried to prevent any future use of atomic weapons. Einstein died in Princeton, New Jersey, on April 18, 1955.

Eisenhower, Dwight D.

A famous general during World War II, Dwight D. Eisenhower became the 34th president of the United States in 1953. Eisenhower's two terms in office were a time of peace and prosperity.

Dwight D. Eisenhower

Early Life

Dwight David Eisenhower was born in Denison, Texas, on October 14, 1890. He was the third of the seven sons of David Jacob Eisenhower and Ida Elizabeth Stover. Dwight spent most of his childhood in Abilene, Kansas. He graduated from the U.S. Military Academy at West Point, New York, in 1915. In 1916 he married Mamie Geneva Doud. They had two sons.

Military Career

During World War I Eisenhower commanded a tank training center. After the war he served in the United States, the Panama Canal Zone, Europe, and the Philippines. He also was an aide to General Douglas MacArthur.

During World War II Eisenhower commanded the U.S. forces in Europe. He also led attacks in North Africa. In December 1943 Eisenhower became supreme commander of the Allied forces. He led the invasion of France on D-Day, June 6, 1944. That year Eisenhower gained the highest U.S. military rank, five-star general.

After the war Eisenhower served as Army chief of staff until 1948. In 1950 he was named the first head of the armies of the North Atlantic Treaty Organization.

Presidency

In 1952 Eisenhower won the Republican Party's presidential nomination. His vice presidential running mate was Senator Richard M. Nixon. In the election

Did You Know?

Eisenhower was called Ike from an early age. His presidential campaign slogan was "I like Ike."

that November, Eisenhower easily defeated the Democratic candidate, Adlai E. Stevenson.

As president, Eisenhower helped to end the Korean War in 1953. He tried to ease the problems that had developed between the United States and the Soviet Union since the end of World War II. He also called for lower taxes and less government control over the economy.

Eisenhower suffered a heart attack in 1955. He recovered quickly, though, and decided to seek a second term. In the 1956 election he defeated Stevenson again.

Eisenhower now faced serious problems at home and abroad. At home his biggest challenge was the integration of schools. Some people thought that African American students should not be allowed to attend the same schools as white students. In 1954 the Supreme

Court had said they should be allowed to attend the same schools. But in 1957 the governor of Arkansas kept nine African American students from entering a high school in Little Rock. Eisenhower sent federal troops to protect the students from angry whites.

Also in 1957 the Soviet Union launched the first artificial satellite, Sputnik 1, into space. The United States raced to put its own satellite, Explorer 1, into orbit in 1958. That year Eisenhower approved the creation of the National Aeronautics and Space Administration (NASA).

Hoping to improve relations with other countries, Eisenhower toured many parts of the world. In 1959 he welcomed Soviet premier Nikita Khrushchev to the United States. After the Soviets shot down a U.S. spy plane over Soviet territory, however, Eisenhower did not make his planned visit to the Soviet Union.

TIMELINE

Eisenhower is born in Denison, Texas.

October 14, 1890

Eisenhower is elected president.

1952

The leader of the Soviet Union meets with Eisenhower in the United States.

1959

Eisenhower dies in Washington, D.C.

March 28, 1969

Eisenhower gains command of the Allied forces in Europe during World War II.

1943

Eisenhower forces Little Rock, Arkansas, to allow black students into an all-white school.

1957

Eisenhower's second term ends.

1961

Retirement

Eisenhower's vice president, Nixon, lost to John F. Kennedy, a Democrat, in the election of 1960. The following January Eisenhower retired to his farm in Gettysburg, Pennsylvania. He died of heart failure in Washington, D.C., on March 28, 1969.

Electoral College

Every four years, millions of citizens vote for president and vice president of the United States. But the citizens' votes (called popular votes) do not directly elect these leaders. Their votes actually elect the 538 members of a group called the electoral college. The electoral college then elects the president and vice president.

How Electors Are Chosen

The electoral college is organized by states. Each state gets a certain number of electors—the people who vote in the electoral college. A state's number of electors equals its number of senators and representatives combined. Every state has two senators. The number of representatives is based on the population of the state, though every state has at least one representative. In addition, the District of Columbia (Washington, D.C.) gets three electors.

A certificate from Alabama shows the signatures of the state's electors in 2000. The nine electors voted for George W. Bush.

The United States has two main political groups, or parties (the Democrats and the Republicans). Each political party chooses a candidate for president and a candidate for vice president. In each state, each party also chooses a group, or slate, of electors. The electors promise to vote for their party's candidates. When citizens vote for the candidates of one party, they are actually choosing that party's electors for their state.

In most states, the party that wins the most popular votes sends all its electors to vote in the electoral college. (Maine and Nebraska choose electors slightly differently.) The electors for every state then vote for their party's candidates. The candidates with the most electoral

Did You Know?

All the electors do not meet in one place to vote. Instead, every state has its own gathering.

votes become president and vice president.

History

The electoral college came about partly because the people who wrote the U.S. Constitution did not trust the common voters. In most elections there have been few complaints about the process. Usually, the candidates who win the most popular votes also win the most votes in the electoral college. But this is not always so. In the 2000 election, more citizens voted for Al Gore than for George W. Bush. However, Bush became president. This happened because Bush's party won in enough states to send the most electors to the electoral college. Besides Bush, two other U.S. presidents have been elected with fewer popular votes than their opponents. They were Rutherford B. Hayes in 1876 and Benjamin Harrison in 1888.

Electricity

Electricity is a form of energy. It can be seen in nature in a bolt of lightning. Scientists have also learned how to generate, or create, electricity. This is useful because electricity that is generated can be controlled and sent through wires. It can then power such things as heaters, lightbulbs, and computers. Today electricity provides most of the energy to run the modern world.

How Electricity Works

Everything in the universe is made of tiny particles called atoms. Each atom has even tinier particles called protons and electrons. An electron has what is called a negative charge. A proton has a positive charge. Positive and negative charges try to move close together. However, two positive charges, or two negative charges, will push each other away. Electricity results when electrons are pushed and pulled from atom to atom.

Static Electricity

The electrons can be moved by actually rubbing one object against another. This creates something called static electricity. Static electricity explains why rubbing a balloon against one's hair can make the hair stand on end. The electrons move from the balloon to the hair. Because the hairs then all have the same kind of charge, they try to fly away from each other.

Generating Electricity

Many moving electrons are called an electric current. A city's power plant

Electricity in the form of lightning brightens the sky above a city.

Static electricity makes a child's hair stand on end.

produces a powerful electric current and sends it through wires. The electricity used for lighting, heating, and running appliances is made by machines called generators. Generators cause a current to flow by moving a magnet past a coil of wire.

Wires then carry the current to houses and other buildings. More wires connect to the power outlets in rooms. When a person plugs in an iron, hair dryer, or another electric device, the current travels into the device. The current then makes the device work. A chemical reaction in a battery can also produce an electric current.

History

The ancient Greeks were the first to study electric forces. In the American colonies during the 1700s, Benjamin Franklin performed experiments that proved that lightning is a form of elec-

tricity. Scientists later learned that electricity is related to magnetism. They then learned how to generate electricity using magnets.

Electronic Games

Electronic games are games run by computer technology. They are also called video games. People play electronic games on personal computers, in video arcades, and on home electronic game systems. The home systems are called consoles. Console games are played using a handheld device usually connected to a television. People may play electronic games alone or with others.

How Electronic Games Work

All electronic games begin as computer instructions called software. A computer

Some electronic games are small and can be held in the hand.

programmer writes the software commands to make the game run. The game software is then loaded onto hardware—a computer or a console.

Inside the computer or the console, hardware and software work together to send electronic signals through the system. These signals create the game's sounds and images. The player controls the action of the game using a paddle, a joystick, or a keypad.

Did You Know?

Other early arcade video games that were popular include Ms. Pac-Man, Donkey Kong, Centipede, Asteroids, and Frogger.

History

Electronic games began as very simple programs with poor graphics and no sound. A man named William A. Higginbotham created one of the first electronic games, called *Tennis for Two*, in 1958.

The first arcade game, called *Computer Space*, came out in 1971. More successful arcade games soon followed—for example, *Pong*, *Space Invaders*, and *Pac-Man*. The first electronic game system for home use appeared at about the same time.

In 1977 a company called Atari released a home system with removable cartridges. Each cartridge held a different game. With this system electronic games grew in popularity. But people wanted better graphics and sound.

Seeing the demand, many other companies began developing home electronic games as well. The quality of the games' sound and images steadily improved. The technology used to run the games also improved.

Nintendo was the first company to provide a keypad with its consoles rather than just a joystick. Today Nintendo, Sony, and Microsoft are some of the leading makers of electronic games and game systems.

Game companies continue to add new features to their games. Some systems now let players play together over telephone lines. Electronic gaming has become one of the most popular forms of entertainment in the world.

Electronics

Electronics is a branch of the science called physics. It explains how electricity can be used to carry or process information. Many products are based on electronics. They include computers, digital cameras, radios, television sets, wireless telephones, and video games. Often these products themselves are called electronics.

Electric Signals

Electronic products contain devices that control the flow of electricity. A flow of electricity is called an electric current. Changes in electric currents create electric signals. Electric signals can provide different kinds of information. For example, electric signals in a radio provide sound.

Many electronic products use electric signals to provide information as a number code. These products are called digi-

A worker puts together an integrated circuit, or microchip. Microchips allow electronic products to work quickly and to be small in size.

tal electronics. A digital camera is an example. It changes a picture into many tiny dots and uses electric signals to create numbers that describe each of the dots. Another digital electronic product, such as a computer or a printer, can also read those numbers. They can use the numbers to re-create the picture and print it or display it on a computer screen.

Electronic Devices

Most electronic devices, including computer chips and transistors, are made from silicon. Silicon is a type of material called a semiconductor. A semiconductor lets electricity flow through it only under certain conditions. This property makes it useful for controlling the flow of electricity.

One of the most common electronic devices is the transistor. It controls the flow of electricity by acting as a switch that can be turned on and off. Transis-

tors can be very small. Millions of tiny transistors can be combined into one device called an integrated circuit. This allows electronic products to work with a large number of electric signals very quickly.

Elephant

Elephants are the largest living land animals. There are three species, or kinds: the African savanna elephant, the African forest elephant, and the Asian elephant. They make up the elephant family of mammals. Mammoths and

African elephants are the largest of all living land animals.

An Asian elephant bathes in the Kabani River in India.

mastodons also belonged to this family, but they are now extinct.

Where Elephants Live

Elephants live mainly in forests and grasslands in warm areas. African elephants live in Africa. The Asian elephant lives in India, Sri Lanka, Malaysia, Indonesia, Thailand, and Vietnam.

Physical Features

Elephants' skin is thick, wrinkled, and not very hairy. It is grayish to brown in color. An elephant's trunk is an extension of the nose and upper lip. An elephant uses its trunk to grab food and to put it into the mouth. It can also draw water into the trunk and then blow it into the mouth.

An African elephant has larger ears and a slightly larger body than an Asian elephant. African elephants may stand up to 13 feet (4 meters) at the shoulder.

The Asian elephant may reach about 11.5 feet (3.5 meters) at the shoulder.

Male African and Asian elephants usually have two tusks, which are long upper teeth. Female African elephants have tusks, too, but most female Asian elephants do not.

Behavior

Elephants migrate, or travel, in search of food. They eat only plants, including grasses. They often rest during the hottest hours of the day. They lie down to sleep for only a few hours at night.

Elephants move around in small family groups led by older females, called cows. A family group has two to eight animals. Several groups form a herd. A herd includes as many as 20 to 40 cows and all their babies. Cows are very protective of the young in their herd. At about age 4, the male young move away from the herd. They join separate groups of males, called bulls.

Life Cycle

A baby elephant is born about 22 months after mating. A newborn elephant is about 3 feet (1 meter) tall and weighs about 220 pounds (100 kilograms). An elephant may live for 60 to 70 years.

Elephants and Humans

Humans have used elephants for transportation and as work animals since ancient times. People in Asia still use elephants for these purposes today. In

addition, trained elephants appear in circuses throughout the world.

However, human activities have endangered the survival of wild elephants. Humans have destroyed many elephant habitats. Humans also have killed many elephants for the ivory of their tusks. Humans carve this ivory into works of art, jewelry, and other objects.

Elizabeth I

Elizabeth I was queen of England for almost 45 years. During that time her

Elizabeth I

country became very powerful. Her reign is remembered as the Elizabethan Age.

Early Life

Elizabeth was born in Greenwich, England, on September 7, 1533. Her father was King Henry VIII. Her mother, Anne Boleyn, was the second of Henry's six wives. Henry had Anne Boleyn put to death when Elizabeth was only 3 years old.

Elizabeth had an older half sister named Mary and a younger half brother named Edward. Edward became king in 1547 and died in 1553. Mary then became queen. Henry, Edward, and Elizabeth were Protestant, but Mary was Roman Catholic. She made Catholicism the national religion and put Elizabeth in prison for a time.

Reign

Mary died in 1558, and Elizabeth was crowned queen of England. She was 25 years old. She had received a good education and was well prepared to rule. Many men wanted to marry her, but she stayed single. This gave her more power, but it also put her cousin Mary Stuart next in line for the throne. Mary Stuart, also known as Mary Queen of Scots, was a Catholic. Elizabeth kept her in prison for many years and then had her killed in 1587.

During the first 30 years of Elizabeth's reign, England built up its sea power. English ships sailed across the Atlantic Ocean to the West Indies and challenged Spain for control over trade.

Did You Know?

Elizabeth's family name was Tudor. She was sometimes called Good Queen Bess.

English sea captains raided Spanish ships, and Elizabeth took a share of the treasure they seized.

King Philip II of Spain struck back in 1588. He sent a great fleet called the Armada to attack England. The queen's ships defeated the Armada. That victory was a high point of Elizabeth's reign.

During the 1590s Elizabeth began to suffer from ill health. She died on March 24, 1603. Mary Stuart's son, James VI of Scotland, became king of England.

Elizabeth II

At the age of just 25, Elizabeth II became queen of the United Kingdom of Great Britain and Northern Ireland.

Elizabeth II

She came to the throne after the death of her father, King George VI, in 1952.

Elizabeth Alexandra Mary was born in London, England, on April 21, 1926. Her father was the second son of King George V, who died in 1936. George V's oldest son reigned as King Edward VIII for only a short time. Then he surprised the world by giving up the throne. Elizabeth's father took over as King George VI. As a result, the 10-year-old Elizabeth became next in line for the throne. The young princess began training for her future duties. She also studied history, languages, and music at home. In 1940 she gave her first radio address.

Elizabeth married Philip Mountbatten in 1947. Before the marriage he gained several special titles, including the duke of Edinburgh. Their first child, Prince Charles, was born in 1948. Their younger children are Princess Anne, born in 1950; Prince Andrew, born in 1960; and Prince Edward, born in 1964. Their family name is Windsor.

On February 6, 1952, King George VI died. Elizabeth became Queen Elizabeth II. Her coronation, or crowning ceremony, took place on June 2, 1953.

As queen, Elizabeth does not control the British government. Instead, she serves as a symbol of her country at ceremonies and public events in Britain and around the world.

Ellis Island

Ellis Island was once the first place that many people saw when they moved to the United States from other countries. People who go to a new country to live are called immigrants. Throughout its history the United States has welcomed many immigrants. Many of them arrived by boat at Ellis Island. The island is located in the bay near New York City.

Before 1890 the states handled immigration. Then the U.S. government took over. It built the immigration center on Ellis Island at a time when many people wanted to live in the United States. More than 12 million people passed through the center from 1892 to 1924. The busiest year was 1907, when 1.25 million people passed through.

On Ellis Island, doctors and inspectors examined the immigrants. They checked for disease and wrote down information about each person. Then they decided who could stay in the United States. Most people passed the tests and went on to New York City after a few hours. Others failed their examinations. Some had serious diseases. Others were seen as troublemakers. These people waited on the island for a ship to take them back home.

In 1924 Congress passed a law that made it harder to immigrate to the United States. Those who did come passed through other places. Ellis Island mainly held people who were having

Ellis Island covers only about 27 acres (11 hectares), but it used to be even smaller. It was built up with boatloads of rocks and dirt.

Immigrants at Ellis Island in the early 1900s wait to have a physical examination. Doctors and inspectors decided who was healthy enough to be allowed to stay in the United States.

immigration problems. In 1954 the center on Ellis Island closed. In 1976 the island became a tourist center, and in 1990 the immigration center reopened as a museum. Today many people visit Ellis Island on their way to the nearby island that has the Statue of Liberty.

Elm

Several species, or types, of tree belong to a family of plants called the elm family. Large numbers of elms used to grow in cities. During the 1900s, however, a disease killed many elms.

Elms grow mainly in the Northern Hemisphere. North American elms include the American elm; the slippery, or red, elm; the rock, or cork, elm; the winged, or wahoo, elm; and the cedar elm. The English elm and the Wych elm

are European species. Asian elms include the Siberian elm and the Chinese elm.

Elms are often about 50 to 70 feet (15 to 21 meters) tall. But some types may grow higher than 100 feet (30 meters). The leaves of elms are toothed, which means that they have jagged edges. The flowers do not have petals. They grow in clusters. The fruits, called samaras, are flat disks that each hold one seed.

People often plant elms because they grow quickly into beautiful shade trees. People use elm wood to make boats, farm buildings, or furniture.

Dutch elm disease has killed many North American and European elm trees. A fungus carried by beetles causes this disease.

El Salvador

El Salvador is the smallest of the seven countries in Central America. It is also the most crowded. Its capital is San Salvador.

Geography

The Pacific Ocean forms El Salvador's southern border. The country shares land borders with Guatemala and Honduras. El Salvador has two mountain regions with volcanoes. Lowlands along the coast are generally hot and humid. Temperatures are cooler in the mountains.

Plants and Animals

Balsa, cedar, mahogany, coconut, mango, and palm trees grow in El Salvador. However, many of its forests have been cleared to make room for farming. Wilderness preserves protect spider monkeys, anteaters, mountain lions, and hummingbirds.

People

Nearly 90 percent of El Salvadorans are mestizos, or people with mixed American Indian and European roots. Most other people are Indians, including the Izalco and the Pancho. Spanish is the main language. Most people practice Roman Catholicism. More than half of the population lives in cities.

Economy

El Salvador's economy is based on manufacturing and farming. Factories produce mainly food products and clothing. Clothing and coffee are the most important exports. Sugarcane and corn are other important crops.

History

The Pipil Indians probably arrived in what is now El Salvador about 1,000 years ago. The Spanish reached the region in 1524 and defeated the Pipil by 1539. Spain ruled the land as a part of Guatemala until 1821. In 1823 El Salvador joined the United Provinces of Central America, a union of five states formerly ruled by Spain. When the union broke up, El Salvador became independent in 1840.

Decades of political violence grew into civil war by the end of the 1970s. Government and rebel leaders finally signed a peace treaty in 1992.

Emancipation Proclamation

The American Civil War pitted Southern states against Northern states. One of the major issues was whether the Southern states should be allowed to continue owning slaves. During the war, President Abraham Lincoln issued the Emancipation Proclamation. This document, issued on January 1, 1863, declared that the slaves in the Southern states were free.

The president could not really enforce the proclamation in places that were still controlled by Southern troops. Even so, the proclamation was important because it made the American Civil War a fight about slavery.

The proclamation also opened the U.S. Army to freed African Americans. As soon as the Northern armies captured a region, the slaves there were given their freedom. Nearly 180,000 of them joined the Northern forces. They were very

President Abraham Lincoln called the Emancipation Proclamation "the greatest event of the 19th century."

helpful in bringing about the final surrender of the Southern forces in 1865. After the war, the 13th Amendment to the U.S. Constitution ended slavery throughout the United States.

Empire

Throughout history countries have wanted to control lands beyond their borders. This practice is called imperialism, and the lands that they control are called an empire. The ruler of an empire is sometimes called an emperor. Countries build empires mainly to get power or wealth.

Building Empires

Sometimes a ruler builds an empire by taking over nearby lands. One famous empire of this type was the Roman Empire of ancient times. The Romans spread their power from the city of Rome to lands in Europe, North Africa, and western Asia.

An empire may also consist of lands far from the controlling country. Sometimes a country sends people to live in a new place overseas. The settlements that those people set up are called colonies. In the 1600s, for example, England sent people to set up colonies in eastern North America. Those colonies eventually became the United States.

Sometimes, instead of sending many settlers, a country sends only a few

Great Britain ruled land all over the world from about the 1600s to the 1900s. A map shows the huge size of the British Empire in the late 1800s. The British lands are shown in orange.

people to govern the new place. Those places are often called colonies as well. In the 1800s, for example, European countries seized control of most of Africa. In most cases only a small number of Europeans went to the colonies in Africa. They oversaw the government of the colonies. They also set up businesses and controlled trade. Sometimes the European colonizers forced the Africans to work for them.

Effects of Empires

Imperialism has had a great influence on world history. It has led to the discovery and development of new lands. Imperial powers have built useful things such as roads, schools, and hospitals. Imperialism has also spread knowledge and culture. In many places that were once colonies, the people still speak the language of the colonizers. The religions of colonial powers are also common in former colonies.

Imperialism has also had many negative effects. Imperial powers killed many native people in wars of conquest. They made other native people work for low wages or as slaves. They also often forced the people to give up their traditional way of life.

History

The Phoenicians were among the earliest colonizers. About 3,000 years ago they set up trading posts along the eastern coast of the Mediterranean Sea, in North Africa, Anatolia (now Turkey), and Cyprus. Later the Assyrians, the Persians, the Greeks, and the Romans had empires in the region. The Roman Empire reached all the way from Britain to Egypt.

Imperialism also happened in Asia. The first empire in India was established in the 300s BC. In China the Qin Dynasty created the first empire in 221 BC.

After the fall of the Roman Empire in the AD 400s, no European country was

The Romans built Hadrian's Wall across Great Britain in ancient times. It included a long stone wall and forts to keep invaders out of the Roman colony in Britain.

strong enough to establish colonies. Between the 600s and the 1200s Arabs built up an empire in western Asia, North Africa, and Spain. They spread their religion, Islam, to the places they conquered.

In the late 1400s European explorers first crossed the Atlantic Ocean to the Americas. That began a great age of exploration. Soon European countries began claiming land in the Americas, India, and the East Indies. England, France, Spain, Portugal, and the Netherlands had many colonies.

Most colonies in North and South America gained freedom between 1776 and 1826. But at the same time European countries started building empires in Africa. In the 1880s European powers

divided up almost all of Africa between themselves.

In the late 1800s and early 1900s the United States and Japan became colonial powers. The United States took control of islands in the Caribbean Sea and the Pacific Ocean. Japan conquered lands in East Asia. Imperialism by Japan, Italy, and Germany in the 1930s led to World War II. After the war the Soviet Union built an empire in eastern Europe.

The large empires of the past no longer exist. Between 1945 and 1990 about 100 colonies gained their freedom. Sometimes this happened peacefully, with the colonial power stepping aside. Other times the people of the colonies fought for independence.

Encephalitis

Encephalitis is an inflammation, or swelling, of the brain. It is often a mild illness, but serious cases can cause brain damage.

Particles called viruses or such tiny living things as bacteria and parasites can cause encephalitis. So can harmful chemicals. Viruses are the most common cause. The viruses that cause chicken pox, mumps, and measles can turn into encephalitis. These viruses spread from person to person. Mosquitoes and other biting insects also spread viruses. Some

An X-ray photograph shows encephalitis on the right side of a brain.

of these viruses, such as West Nile virus, can cause encephalitis.

Encephalitis has a wide range of symptoms, or signs. These include fever, headache, tiredness, a stiff neck, and vomiting. In the most severe cases people may fall into a coma. A coma is a deep, heavy sleep. Recovery in severe cases can take weeks. There may be damage to the brain that cannot be fixed.

Doctors use medicines to fight the causes of encephalitis and to ease its symptoms. The best way to prevent encephalitis is to stop the spread of the things that cause it. Washing hands helps to kill viruses and bacteria. Insect repellent helps to keep insects from biting. Vaccines prevent many illnesses that can cause encephalitis. Vaccines are sub-

stances given to healthy people that help the body fight disease.

Endangered Species

An endangered species is any type of plant or animal that is in danger of disappearing forever. If a species, or type, of plant or animal dies out completely, it becomes extinct.

How Plants and Animals Become Endangered

Animals and plants depend on each other and their environment to survive. When their environment, or habitat, changes or disappears, plants and animals may become endangered. Natural

The California condor was hunted and poisoned until it became an endangered species. Now it is protected by law.

disasters or changes in the climate can harm or destroy habitats.

Humans can cause species to become endangered as well. Humans pollute habitats with garbage, car fumes, and factory wastes. They destroy habitats by clearing land for roads, buildings, and farms. They also may hunt and kill too many of certain types of animals.

The arrival of a new species in a habitat is another threat. Often the new species spreads freely because it has no natural enemies. The species already in the habitat may not be able to compete against the newcomer. For example, mongooses brought to Jamaica in the 1800s killed many native animals.

Endangered Species Today

The list of endangered animals includes many large, well-known mammals. The tiger and both African and Asian elephants are endangered. Several types of whale are also endangered. The giant panda survives only in remote parts of China and in zoos.

Endangered birds include several types of crane, eagle, and parrot. Among the endangered reptiles are several types of sea turtle—for example, the leatherback turtle. There are also endangered amphibians, fishes, mollusks, insects, and other animals.

Endangered plant species range from tiny mosses to towering trees. The mandarin tree is an endangered shrub with bright red flowers. Foreign species of plant have been taking over its habitat

on the island of Mauritius. In the early 21st century fewer than 50 of these plants were growing in the wild. Another endangered plant, the Bermuda cedar tree, grows in the wild only in Bermuda. People have cut down many of these trees to build houses, ships, and furniture.

Protection

In the 1960s people became aware that many species were endangered. Today many countries have made it illegal to harm, capture, kill, or sell endangered species. In addition, many organizations work to keep endangered species from becoming extinct. The International Union for Conservation of Nature and Natural Resources keeps lists of endangered species. The Nature Conservancy and the World Wildlife Fund help to set aside land for threatened wildlife. Nature preserves and zoos help endangered animals to reproduce. Such programs have helped to increase the populations of the black-footed ferret, the California condor, and other endangered animals.

Endocrine System

In the human body, a group of organs called glands make up the endocrine system. Glands make hormones. These are chemicals that help control activities of the body. Insects, fish, amphibians,

Did You Know?

One endangered species that was saved from extinction is a bird called the whooping crane. In 1937 fewer than 20 remained. Now there are several hundred.

reptiles, birds, and mammals all have endocrine systems.

Glands

The glands of the human endocrine system make more than 20 major hormones. The hormones travel in the blood to cells throughout the body. A part of the brain called the hypothalamus helps to control the release of many hormones.

The major glands of the endocrine system include the pituitary, thyroid, and adrenal glands, as well as the pancreas. The ovaries are glands found only in women. Men have glands called testes.

Pituitary Gland

The pituitary gland is a bean-sized gland at the base of the brain. It sits beneath the hypothalamus. The pituitary gland makes hormones that control many body functions. One hormone controls the growth of the body. Another helps women deliver babies and helps produce milk so that women can nurse their babies. Other hormones made by the pituitary gland control how other endocrine glands work.

Thyroid and Parathyroid Glands

The thyroid gland is located at the base of the neck. It produces a hormone that controls how fast cells burn food to release energy. Four parathyroid glands are attached to the thyroid gland. They make a hormone that helps control the amount of calcium in the blood. Calcium is an important mineral that helps bones to grow.

Most glands of the endocrine system are found in both women and men. Only women have ovaries. Only men have testes.

One of the hormones made by the pituitary gland controls the growth of the body.

Adrenal Glands

One adrenal gland sits on top of each kidney. The two adrenal glands are divided into two main parts. One part produces hormones that do many jobs. For example, they control the mixture of salt and water in the body. The other part makes hormones that raise blood pressure and heart rate when the body is under stress.

Pancreas

The pancreas is located just behind the stomach. This gland produces two important hormones called insulin and

glucagon. They work to keep the right amount of sugar in the blood.

Ovaries and Testes

Ovaries sit in the pelvis, or lower belly, of females. They make hormones that cause breasts, wide hips, and other female features to develop. Testes sit in a pouch behind the penis in males. They make hormones that cause a deep voice, facial hair, and other male features to develop. In addition to hormones, ovaries produce female sex cells, or eggs, and testes make male sex cells, or sperm. For this reason, ovaries and testes also belong to the reproductive system.

Problems with the Endocrine System

Diseases of the endocrine system cause the glands to make too much or too little of a hormone. One type of the disease called diabetes happens when the pancreas does not produce enough insulin. If the pituitary gland does not make the right amount of growth hormone, children will grow too much or too little.

Problems with the thyroid gland can cause many symptoms. Too much thyroid hormone in the blood causes weight loss, a high heart rate, nervousness, sweating, bulging eyes, and a swelling in the neck. Too little thyroid hormone causes weight gain, a slow heart rate, dry skin, and a feeling of tiredness.

Energy

Energy is another word for power. Energy makes things move. It makes machines work. Energy also makes living things grow.

Types of Energy

Energy exists in many different forms. Animals get energy from eating food. Electrical energy is associated with the tiny units called atoms that make up everything in the universe. The energy is created when particles called electrons move from one atom to another. Heat and light are also forms of energy. One form of energy can also be transferred into another. Through a battery, stored chemical energy changes into electric energy. In a lightbulb, electric energy changes to light and heat.

Each of these forms of energy can be described as either potential energy or kinetic energy. Potential energy is stored energy. An object with potential energy has the ability, or potential, to move. Potential energy comes from the position or the shape of an object. For example, potential energy is stored in a rock perched on a cliff and in an arrow stretched back on a bowstring. If the cliff crumbles under the rock, the rock falls. If the string is let go, it moves forward and pushes the arrow through the air.

As the rock and the arrow move, they gain kinetic energy. Kinetic energy is the energy of moving things. All moving objects have kinetic energy—even atoms.

Wind turbines in California produce electricity.

Sources of Energy

The sun is the source of almost all energy on Earth. The sun makes plants grow. When animals eat the plants they gain energy from the chemicals that make up the plants. When plants die they decay, or break down. Over millions of years this process creates what are called fossil fuels. Fossil fuels include petroleum, natural gas, and coal. These are used to run factories, heat homes, and power automobiles.

Fossil fuels pollute the atmosphere when they are used. They are also being used up very quickly. Scientists therefore have tried to find other sources of energy to replace the fossil fuels. Some of these sources have been used directly for many years. These include wind, water, and heat from Earth. Sailboats harness the power of the wind to move them along. Water mills use water flowing through rivers to turn wheels that grind grain. In ancient times some people used hot water and gases from Earth to heat

their houses. They ran the hot air in pipes underneath their floors to provide heat.

Scientists gradually learned to use these natural sources to create new forms of energy. These new forms include electricity and nuclear energy. For example, the energy of wind is now used to turn machines that create electricity. On many rivers people have built dams. The dams use the energy of the flowing river to operate machines that also create elec-

tricity. In sunny areas devices collect the heat of the sun and store it. That heat can be used to heat water and to heat houses. Other devices convert the sun's rays into electricity. This is known as solar energy. Scientists have also learned how to use certain atoms to make nuclear energy. Nuclear power in turn can be used to create electricity.

Humans use energy from many different sources. They harness the power of wind, water, and sunlight.

England

England is the largest of the four parts of the country called the United Kingdom.

The other parts are Northern Ireland, Scotland, and Wales. London is the capital of both England and the United Kingdom.

Geography

England is located on the island of Great Britain, which lies off the coast of western Europe. The English Channel sepa-

rates England from France. Scotland lies to England's north, and Wales is to its west.

Most of England is covered with hills. The Cumbrian Mountains are in the northwest. The Pennines are lower mountains in the north and center of England. The shores are lined with cliffs and bays. The longest river in England is the Thames. It flows through a large part of the southeast. England's climate is rainy and mild.

Plants and animals provide energy in the form of food. People also burn oil, coal, and natural gas for energy. They get nuclear energy from uranium atoms.

Economy

Services such as tourism, banking, and insurance are the most important part of the English economy. London is a major world center for finance. Manufacturing businesses make foods, chemicals, textiles, computers, automobiles, and aircraft. England's major crops include wheat, barley, and potatoes and other vegetables. Cattle and sheep are raised for meat and milk.

People

The people of England are a mixture of many different ethnic groups. The early people of the area were called Celts. Invaders from Germany, Denmark, France, and other parts of Europe came later. Most of the English people are descendants of these peoples. People from Asia, Africa, and the Caribbean islands make up smaller groups. Most of the population lives in cities.

Most of England's people are Christian. The Church of England, which is Protestant, is the country's official church. There are also large groups of Muslims, Sikhs, Hindus, and Jews.

History

People have lived on the land that is now England for thousands of years. The Celts lived there as early as 500 BC. The Romans came later. In the AD 400s and 500s three peoples from northern Europe—Angles, Saxons, and Jutes—conquered England. Their language, Anglo-Saxon, later developed into English. The region became known as "Angle-land," which later became "England."

The Normans, a people from France, conquered England in 1066. They ruled until 1154, when Henry II came to power. Henry began a new line of

Sheep graze in a field in the Cotswolds, a hilly part of south-central England.

English kings and gained new territory for the country.

The early kings struggled for power with the Roman Catholic church and the nobles. King John was a cruel and unpopular ruler. The nobles joined together to try to limit his power. In 1215 they forced King John to agree to a document called the Magna Carta. The Magna Carta gave rights to the English people. Later in the 1200s Parliament, the English lawmaking body, was formed.

During the reign of Queen Elizabeth I (1558–1603) England became a great power at sea. English ships defeated a fleet sent from Spain. The country's power soon spread to other parts of the world as well. English merchants began to set up trading posts in faraway places, including India and North America.

In the 1600s the English kings fought with Parliament. They did not want to share power. This conflict led to civil war in 1642. People who supported the king fought people who supported Parliament. Parliament won. From 1649 to 1660 England had no king. England welcomed a new king in 1660. But from then on, the power of English kings and queens was more limited.

Over hundreds of years England gradually took control of neighboring territory. Wales was united with England in 1536. In 1707 Scotland merged with England and Wales to form the kingdom of Great Britain. In 1801 Ireland was joined to England, Scotland, and

Wales to form the United Kingdom. Most of Ireland broke away in 1921, but Northern Ireland remained part of the United Kingdom.

English Channel

The English Channel is a narrow arm of the Atlantic Ocean. It separates the southern coast of England (part of the United Kingdom, or Great Britain) from northern France. In French, the channel is called La Manche (The Sleeve).

The English Channel is 350 miles (560 kilometers) long. At its widest point it is 150 miles (240 kilometers) across. At its narrowest it is only 21 miles (34 kilometers) across.

The channel and the North Sea are connected at the Strait of Dover in the east.

Did You Know?

The first person to swim across the English Channel was Matthew Webb in 1875. Since then hundreds of people have done it.

The main islands are the Isle of Wight and the Channel Islands (a collection of islands including Jersey, Guernsey, Alderney, and Sark).

Sandy beaches and a good climate have led to the development of many tourist resorts on the shores of the channel. These include Deauville in France and Brighton in England. There are many important ports on both sides of the channel as well. Southampton in England and Le Havre in France are two examples.

Historically, the English Channel has been more than just a body of water to sail on. It has sometimes made it difficult for invaders from the European mainland to reach Britain. At other times it has served them as a travel route. When the Roman leader Julius Caesar invaded in 55 BC, for example, he crossed at the Dover Strait.

As long ago as the 1800s, people thought of building a tunnel under the channel to connect England and France. In 1978 the British and French national railways reached an agreement on the idea. The Channel Tunnel, or “Chunnel,” as it is sometimes nicknamed, opened in 1994.

Enlightenment

The Enlightenment, or the Age of Reason, began in Europe in the 1700s and spread to many parts of the world. The

The French *Encyclopédie* (Encyclopedia) was one of the main works of the Enlightenment. Many thinkers met to discuss this project.

thinkers of the Enlightenment objected to the absolute power of the royal rulers and of the Roman Catholic church. They used reason, or logical thinking, and science to attack this power. Their ideas helped bring about the American Revolution and the French Revolution.

Background

For hundreds of years most European countries were ruled by kings and queens. The countries' royal rulers, or monarchs, were the sons and daughters of earlier kings and queens. These rulers claimed their powers to be given by God. The monarchs, the leaders of the church, and the wealthiest families had always held all the power and all the advantages.

But in the 1500s, during a period known as the Renaissance, the number of educated people in Europe began to grow. Many of these scholars adopted the ideas of the ancient Greeks and Romans. These ideas focused on the

importance of all people and on their ability to reason. Scholars encouraged the study of science. The Renaissance led to important discoveries in the 1600s. Galileo proved that Earth moved around the sun. Isaac Newton explained the laws of gravity.

Ideas of the Enlightenment

The ideas that blossomed during the 1500s and 1600s influenced many thinkers during the 1700s—the time of the Enlightenment. Some of the most famous Enlightenment thinkers were Denis Diderot, John Locke, Jean-Jacques Rousseau, Adam Smith, and Voltaire.

These thinkers, called philosophers, wrote many books, including a 35-volume encyclopedia. Some wrote books questioning religion. They objected to the church having power over everyone. The philosophers criticized the monarchs' laws. They also questioned the idea that God had given the monarchs their power.

Enlightenment thinkers applied science and reason to society's problems. They believed that all people were created equal. They also saw education as something that divided people. If education were available to all, they reasoned, then everyone would have a fair chance in life.

Results

Enlightenment ideas were popular and spread quickly. The Roman Catholic church and the monarchs tried to censor, or ban, the books and other works

of the philosophers. The rulers were right to be alarmed. The Enlightenment led many people to think about their government and to think that they should change the government. They wanted to take power away from the kings and queens and give it to the ordinary people. This led to the American and French revolutions, when the monarchs lost their power.

Environment

All the physical surroundings on Earth are called the environment. The environment includes everything living and everything nonliving.

The nonliving part of the environment has three main parts: the atmosphere, the hydrosphere, and the lithosphere. The atmosphere is the air—the layer of nitrogen, oxygen, and other gases that surrounds Earth. All the oceans and

Children who pick up litter are helping to protect the environment.

other bodies of water on Earth make up the hydrosphere. The lithosphere consists of the rocks and soil on the surface of Earth. People, animals, plants, and all other living things rely on the nonliving parts of the environment to survive. The part of the environment where life happens is called the biosphere.

The biosphere is made up of many ecosystems. These are communities of living things and the nonliving things that they rely on.

Changes in the environment therefore affect living things. Some changes are natural. They include weather conditions; the wearing away, or erosion, of rocks and soil; and natural disasters such as earthquakes.

People make changes in the environment, too. Many of these changes are harmful to living things. Around the world, human activities have destroyed animals' habitats and polluted the air and water. In addition, people's use of oil, coal, and natural gas may have led to global warming. This is a rise in the temperature of Earth's surface.

Today many people are working to protect the environment. These people try to conserve, or save, natural resources. They also try to recycle, or reuse, products to avoid waste and pollution.

Did You Know?

A woman named Rachel Carson wrote about pollution in a book called *Silent Spring* in 1962. It helped start the modern effort to protect the environment.

Enzyme

Enzymes are important substances made by the cells of plants and animals. They are catalysts, or substances that control how quickly chemical reactions occur. These reactions are the processes that keep all plants and animals functioning. Enzymes help the body perform such tasks as digestion and growing new cells.

Enzymes travel both inside and outside cells. However, each enzyme is very particular about where it will work and what it will do. An enzyme usually does just one task. Also, an enzyme acts on only one type of substance, called the substrate. The substrate fits into only one place on an enzyme, the way a key fits into a keyhole.

The many different types of enzyme have many different tasks. Enzymes usually speed up a process that otherwise would be much slower. Some enzymes work in the digestive system of animals to break down food. In plants, enzymes are used in photosynthesis. Photosynthe-

Yeast has enzymes that make dough rise.

sis is the process by which plants get their food from sunlight. Other enzymes move parts from one molecule to another or help a cell burn fuel.

Enzymes are especially important for controlling the speed at which things happen in a cell. For example, the body breaks down sugars for energy. Enzymes make sure this happens slowly so that too much energy is not created too quickly.

People also use enzymes in industry and medicine. Enzymes help to heal cuts and to diagnose certain diseases. They are also an important part of the process called fermentation. This helps turn milk to cheese and juice to wine, and it makes bread rise before it is baked.

Eoraptor

Eoraptor may be one of the earliest dinosaurs that ever existed. The name *Eorap-*

tor means “dawn thief,” “early plunderer,” or “dawn raptor.”

When and Where *Eoraptor* Lived

Eoraptor lived about 231 to 223 million years ago during the period of Earth’s history called the Triassic. *Eoraptor* fossils, or remains, have been discovered in Argentina in South America. The dinosaur lived on a lowland coastal plain with many rivers and lakes.

Physical Features

Eoraptor was considerably smaller than most of the later dinosaurs. It grew to an average of about 3 feet (1 meter) in length and weighed about 22 pounds (10 kilograms). *Eoraptor* stood and walked on its two back legs and had short arms. It had hands with three long clawed fingers at the end of each arm. *Eoraptor* had different types of razor-sharp teeth. Its top teeth were jagged like a saw and curved like those of other meat-eating dinosaurs. The bottom teeth were similar to those of the plant-eating dinosaurs.

Eoraptor was not much larger than a modern-day chicken.

Behavior

Eoraptor was a meat eater. It preyed on small plant-eating dinosaurs. It also ate mammal-like reptiles that were plentiful at the time. Scientists believe that *Eoraptor*, like other meat-eating dinosaurs, also may have been a scavenger. This means that it would have fed on dead animals.

Epidemic

Women in Taiwan wear face masks to protect themselves from getting an illness called SARS. A SARS epidemic began in Asia in 2003.

An epidemic is an outbreak of a disease that quickly infects a large number of people. When an epidemic spreads over a wide area, it is called a pandemic. The disease that causes an epidemic may be passed from person to person. Or it may be carried to people by something nonhuman—for example, insects or infected water.

There have been many deadly epidemics throughout human history. In Europe during the 1300s a disease called the plague killed about 25 million people. It became known as the Black Death.

Smaller outbreaks of plague struck European cities for the next 300 years or so. In 1918–19 there was a deadly influenza (flu) pandemic. More than 20 million people died throughout the world.

Epidemics are not as common as they once were. Cleaner living conditions and improved medicine have helped to slow the spread of diseases. But epidemics of diseases such as malaria and cholera still happen in some parts of the world. The disease called AIDS appeared in the 1980s and spread rapidly, especially in Africa. In 2003 a flu-like illness called SARS became an epidemic. SARS began in Asia and spread throughout the world within a few months.

Epilepsy

Epilepsy is a medical condition that affects the brain. The brain's cells communicate with other cells by firing tiny

A machine can check the electrical activity of the brain to help determine if a person has epilepsy.

electrical signals. An attack called a seizure happens when brain cells signal much faster than normal. People with epilepsy suffer from such seizures.

Seizures range from mild to harsh. Someone having a seizure may fall down. Muscles may jerk, stiffen, or become limp. The person may lose consciousness. Breathing can stop temporarily. The person may stare, blink, or have sudden emotions.

Epilepsy may result from a brain injury or a brain tumor. A stroke or a disease that affects the brain can also cause epilepsy. Sometimes epilepsy is passed down from parent to child.

Epilepsy is hard to prevent. In about half the cases the actual cause is not known. People can lessen their chance of brain injury by wearing seat belts in cars and helmets on bikes.

There is no cure for epilepsy. Medicine and a special diet can help control seizures. Sometimes doctors perform brain surgery. They may also place a small machine under the person's skin. The machine sends electricity to the brain to reduce the number of seizures.

Equator

The equator is an imaginary circle around Earth. It divides Earth into two equal parts: the Northern Hemisphere and the Southern Hemisphere. It runs

An imaginary line called the equator runs east and west around the middle of Earth. It divides the globe into two parts, called hemispheres.

east and west halfway between the North and South poles. The distance around the equator is about 24,900 miles (40,000 kilometers).

The equator appears on maps and globes. It is the starting point for the measuring system called latitude. Latitude is a system of imaginary east-west lines, called parallels, that circle Earth parallel to the equator. Parallels are used to measure distances in degrees north or south of the equator. The latitude of the equator is zero degrees.

The equator passes through northern South America, central Africa, the Southeast Asian country of Indonesia, and the islands of Oceania. These places generally have warm climates. This is because the equator receives more direct sunlight throughout the year than any other area of Earth.

Equatorial Guinea

Equatorial Guinea is a country on the west coast of Africa. It includes a mainland region as well as several islands. The capital, Malabo, is on Bioko Island.

Geography

The mainland region, called Río Muni, is bordered by Cameroon and Gabon. The Gulf of Guinea, a part of the Atlantic Ocean, separates Río Muni from the islands of Bioko, Corisco, Great Elobey, Little Elobey, and Annobón. Bioko is made up of three extinct volcanoes. All of Equatorial Guinea has a warm climate with rainy and dry seasons.

Plants and Animals

On the mainland, okume, African walnut, and mahogany trees grow in thick rain forests. Bioko has mangrove swamps along the coast. Hunting has decreased Equatorial Guinea's wildlife, which includes gorillas, chimpanzees, leopards, elephants, and crocodiles.

People

The Fang people form the majority of the population. The largest group on Bioko is the Bubi. Spanish and French are the official languages. Most people are Roman Catholics. Almost half of the population lives in cities.

Economy

Equatorial Guinea's economy depends on its petroleum (oil) reserves. Farming and logging are also important. The main crops are cassava, sweet potatoes, palm oil, bananas, coconuts, cocoa, and coffee. Petroleum, wood, and cocoa are sold to other countries.

History

Portuguese explorers claimed the island of Bioko, which they called Fernando Po, in 1494. In 1778 Spain took over the islands, which were a stopping point for slave traders. From 1827 to 1858 the British occupied Fernando Po, where it fought the slave trade. Spain later combined the islands and the mainland into the colony of Spanish Guinea.

Equatorial Guinea declared its independence from Spain in 1968. The first president ruled harshly, and many citizens were killed or left the country. Later presidents allowed some elections but kept strong control.

Erie, Lake

Lake Erie is the fourth largest of the five Great Lakes of North America. It was named after the Erie Indians, who once lived on its shores.

Lake Erie forms the boundary between the Canadian province of Ontario and the U.S. states of Michigan, Ohio, Pennsylvania, and New York. It covers an area of 9,910 square miles (25,667 square kilometers). It is the shallowest and stormiest of the Great Lakes.

At its eastern end Lake Erie empties over Niagara Falls into Lake Ontario. Its

western end contains several islands. The largest is Pelee Island. Point Pelee National Park is located on the northwestern shore of the lake, in southern Ontario.

Lake Erie has four major ports. Detroit, Michigan, is at the western end. Buffalo, New York, is at the eastern end. Cleveland and Toledo, both in Ohio, are on the lake's southern shore. The lake is an important link in the Saint Lawrence Seaway. The seaway connects the Great Lakes with the Atlantic Ocean.

Severe water pollution nearly destroyed Lake Erie in the 1960s. It forced many beaches and resorts to close. Scientists and others tried to address the problem beginning in the 1970s. By 1990 the quality of the water in the lake had improved greatly.

Erie Canal

The Erie Canal is an artificial, or man-made, waterway in the U.S. state of

Trees stand among sand dunes on the shore of Lake Erie in Erie, Pennsylvania.

New York. It helps connect the Great Lakes with the Atlantic Ocean. The canal runs 363 miles (584 kilometers) between Buffalo, New York, on Lake Erie, and Albany, New York. From Albany, the Hudson River continues the waterway to New York City.

Work began on the canal in 1817. The engineers and builders who worked on the canal faced many challenges. The land that the canal was to pass through was not flat. The engineers therefore had to figure out how to move boats up and down the natural changes in elevation. They built 83 locks to do this. Locks are

A man steers two mules pulling a boat along the Erie Canal. In the early days of the canal this was how all boats traveled through the canal.

structures that allow boats to be raised or lowered by changing the level of the water beneath them.

By the time the canal was finished in 1825 the engineers had learned a great deal about building canals. They later moved to other states to help build canals throughout the country.

The Erie Canal was an immediate success. It encouraged people to move west and settle the midwestern United States. It also helped the economies of many cities in New York. Boats traveling west through the canal carried settlers from the East Coast to Michigan, Ohio, Indiana, and Illinois. The settlers shipped their farm produce back eastward. In return, manufacturers in the Eastern cities shipped their goods westward. Shipments from New York City to the Great Lakes took eight days using the canal, much faster than before the canal was built.

As the country's railroad system was built, the Erie Canal became less important. However, it stayed in use and was enlarged several times. In 1918 the Erie Canal became the chief link in what is now called the New York State Canal System. Still in operation, it is now used mostly for pleasure boating.

Eritrea

Parts of Eritrea have a very dry climate.

The country of Eritrea extends for about 600 miles (1,000 kilometers) along the Red Sea in northeastern Africa. The country's name comes from the words *Mare Erythraeum*, the Latin name for the Red Sea. The capital is Asmara.

Geography

Eritrea borders Sudan, Ethiopia, and Djibouti. It includes the Dahlak Archipelago, or group of islands, in the Red

Sea. The high Ethiopian Plateau extends into Eritrea from the south. The lowlands along the coast are warmer and drier than the highlands.

People

The Tigray people make up more than half of the population. The Tigray speak Tigrinya and are mostly Christians. The Tigre, the next largest ethnic group, are mostly Muslims. Their language, also called Tigre, is similar to Tigrinya. Some Eritreans also speak Arabic, English, or Italian. About 80 percent of the people live in rural areas.

Economy

Eritreans' crops include root vegetables, sorghum, beans, and grains. Sheep, cattle, and goats are the main livestock. In Asmara, factories make food products, textiles, and leather goods. The country's mines provide salt.

History

Eritrea was originally part of the empire of Aksum. The Ottoman Empire conquered Eritrea in the 1500s. In 1889 Italy made Eritrea a colony. The British controlled Eritrea from 1941 to 1952, when the land passed to Ethiopia. Eritrea gained independence from Ethiopia in 1993. From 1998 to 2000 Eritrea and Ethiopia fought over a strip of land between them.

Types of Erosion

river carving a valley

waves cutting back cliffs

wind blowing topsoil

glacier moving rocks

landslide

Water, wind, glaciers, and gravity all can change the land through the process of erosion.

Erosion

Water, wind, and other natural forces cause rocks and earth to wear away. These forces also move bits of rock and earth to new places. This movement changes the shape of the land. These processes are called erosion.

Types of Erosion

River water picks up and moves mud, pebbles, and larger rocks as it flows downstream. These particles rub against the riverbed and wear away more rock and soil. This kind of erosion helped to carve the Grand Canyon in the southwestern United States. Over millions of years the swiftly moving waters of the Colorado River carried away bits of earth and rock from the land. Little by little the constant rush of water dug a canyon out of a flat stretch of ground.

The pounding of ocean waves against land also causes erosion. The waves constantly move pebbles and sand on beaches. The particles rub against each other and against the rock along the coast. Over time the water and the particles wear down rock into more sand. The water then carries the new sand away.

Like waves, wind constantly carries sand and other small bits of earth from one place to another. Wind forms sand dunes and changes their shape. As wind throws sand and soil at rock, the shape of the rock slowly changes.

The huge masses of ice called glaciers also cause erosion. Glaciers scrape away

parts of the rocks and the earth below as they creep down mountain valleys. Glaciers can even move boulders as big as houses. When the glaciers melt, the moved rocks and earth stay behind.

A landslide shows how gravity helps erosion. Wind and rain can weaken the sides of mountains and hills. Gravity then causes soil, mud, and rocks to tumble down.

Dangers of Erosion

Erosion can be very harmful to farmland. Crops depend on rich soil for healthy growth. But this top layer of soil is thin. Wind and flowing water can sweep it away.

Farmers use several methods to slow down erosion. They plant trees around farmland to block wind. They also cut terraces, or ledges, into sloping land. Water gathers on the terraces rather than rushing down the slope and carrying away the soil.

Eskimo

The Eskimo are native people of the Arctic regions. They live in Greenland, Alaska, Canada, and eastern Russia. Europeans and others have called them Eskimo for hundreds of years. They have different names for themselves. In Canada and Greenland they prefer to be called Inuit. In Alaska they prefer the term Eskimo.

An Eskimo family sits inside an igloo.

The Eskimo traditionally got almost all their food by fishing and hunting. They ate reindeer, seal, walrus, and whale meat. On water Eskimo hunters traveled in kayaks, which are boats covered with animal skins. On land they rode on sleds pulled by dogs.

The Eskimo made shelters called igloos from blocks of snow. They also built houses of stone or logs covered with earth. In summer they lived in tents made of animal skins. They wore clothing made from animal fur and sealskin.

In the 1800s and 1900s some Eskimo left the Arctic to work in towns and cities. Those who stayed began using foreign goods such as guns, motorboats, and snowmobiles.

At the end of the 20th century there were about 117,000 Eskimo throughout the region. In 1999 Canada created an Inuit homeland called Nunavut.

Estonia

Along with Latvia and Lithuania, Estonia is one of the countries in northeastern Europe called the Baltic states. Estonia's capital is Tallinn.

Geography

Estonia borders the Baltic Sea, Russia, and Latvia. Two large islands, Saaremaa and Hiiumaa, lie west of the mainland. Much of the land is low-lying and marshy. On the Russian border is the large Lake Peipus. Estonia has cool summers and moderately cold winters.

Plants and Animals

Forests cover almost half of Estonia. Pines, firs, birches, and aspens are common trees. The forests provide homes for roe deer, elk, lynx, bears, wild boars, and flying squirrels. Birds include various types of eagles and black storks.

People

About two thirds of the people are ethnic Estonians. The Estonian

language is much like Finnish. Russians form the next largest group. There are also small groups of Ukrainians, Belarusians, and Finns. Christianity is the main religion, but less than half of the people are religious. The population is mainly urban.

Economy

Most Estonians work in services, including transportation, computer technology, and telecommunications. Manufacturers make processed food, electronics, machinery, cotton cloth, and wood products. A key part of Estonia's industry is a mineral called oil shale, which is used for fuel.

History

The Estonians survived invasions by Vikings, Danes, Swedes, and Russians until the 1200s, when German knights conquered the area. By 1629 Sweden had won the Estonian lands. After 1721 Russia ruled Estonia for almost two centuries.

The Estonians declared their independence in 1918. In 1940, however, the Soviet Union made Estonia one of its republics. In 1991 Estonia won full independence from the Soviet Union, which was breaking apart. Estonia joined the European Union in 2004.

Ethiopia

The *walia* ibex lives in Ethiopia's Simien Mountains National Park.

Ethiopia is a country in East Africa. It has been a country since ancient times. The capital is Addis Ababa.

Geography

Ethiopia is bordered by Eritrea, Djibouti, Somalia, Kenya, and Sudan. It has no coastline. The land is a mixture of highlands and lowlands. The low Great Rift Valley runs through the highlands toward the northeast. The highest peak in Ethiopia, Mount Ras Dejen, rises to 15,157 feet (4,620 meters).

The climate is mild in the highlands and hotter in the lowlands. There are two rainy seasons, but the country can experience devastating droughts.

Plants and Animals

Grasslands cover much of Ethiopia. Tropical forests grow in the highlands,

but many forests have been cleared to create fields.

National parks and reserves protect some of Ethiopia's unique animals. Among them are the *walia* ibex (a type of mountain goat), the Simien jackal, and the gelada monkey. Ethiopia's lions, elephants, leopards, buffalo, zebras, giraffes, and rhinoceroses are endangered, or at risk of dying out.

People

The Oromo and the Amhara peoples each make up about one third of the population. Other ethnic groups include the Somali and the Tigray. Amharic and Oromo are the most common languages. About half of Ethiopia's people belong to the Ethiopian Orthodox Christian church. About one third of the population is Muslim. More than three fourths of the people live in rural areas, mainly in the highlands.

Women in Ethiopia carry water in jugs.

Economy

Ethiopia is one of the world's poorest countries. The economy depends on agriculture, but poor soil and droughts make farming difficult. The main food crops are corn, sugarcane, sorghum, wheat, and barley. The country grows coffee to sell to other countries. Cattle, sheep, and goats provide meat and leather.

Industry forms only a small part of the economy. Manufacturers make food products, beverages, textiles, leather goods, and chemicals. Mines provide salt, gold, and other minerals.

History

Fossils of some of the earliest human ancestors have been found in Ethiopia. Bones from an apelike creature known as Lucy are between 3 and 4 million years old.

The kingdom of Da'amat ruled the region in the 600s BC. The kingdom of Aksum seized control by around AD 300. Aksum soon adopted Christianity. When Islam started to spread from

nearby Arabia in the 600s, Ethiopia remained Christian. In the 1500s the Portuguese helped the Ethiopians defeat invading Arab armies.

In the late 1800s Italy wanted to make Ethiopia a colony. However, the Ethiopians defeated the invading Italians. Italians again attacked Ethiopia in 1935. The following year they made Ethiopia a part of a territory known as Italian East Africa. The territory lasted until 1941, when British troops forced the Italians out of the area. In 1952 Ethiopia took over Eritrea.

In 1974 Ethiopia's military removed Emperor Haile Selassie from power. That ended the country's ancient monarchy. The military government, known as the Derg, made Ethiopia a socialist country. (Socialists work to spread wealth more evenly among people.)

In the 1970s and 1980s rebel groups fought against the military government. Meanwhile, tens of thousands of Ethiopians died during droughts and famines. In 1991 rebels toppled the military government. Ethiopia held its first democratic elections in 1995.

From 1998 to 2000 Ethiopia fought a border war with Eritrea, which had gained independence in 1993. Tensions between the two countries continued into the 21st century.

Etna, Mount

Mount Etna is the highest active volcano in Europe. It is on the island of Sicily in the Mediterranean Sea. (Sicily is a part of Italy.) Mount Etna is about 11,000 feet (3,350 meters) high. It has a base that measures about 93 miles (150 kilometers) around.

Etna has been an active volcano for more than 2.5 million years. The ancient Greeks created legends about it. According to one story, the volcano was the workshop of Hephaestus, the god of fire, and the Cyclops, a one-eyed giant.

Seventy-one eruptions of Etna were recorded between 1500 BC and AD 1669. The lava flow from a massive eruption in 1669 destroyed a dozen villages and buried part of the town of Catania. Etna erupted 26 more times between 1669 and 1900 and frequently thereafter. In 1983, during an eruption that lasted four months, authorities exploded dynamite to change the lava flow and prevent damage to surrounding towns. Mount

Etna also erupted violently several times in the early 21st century.

Eucalyptus

In Australia eucalypti are sometimes called stringybark trees.

Eucalyptuses, or eucalypti, are tall trees. In fact, some of the tallest trees in the world are eucalypti. Eucalypti are sometimes known as gum trees or stringybark trees.

Eucalypti are most numerous in Australia. They also grow in other places where the weather is mild. Eucalypti can be found in New Zealand, South America, southern Europe, and northern Africa. They also grow in California.

There are more than 500 species, or types, of eucalyptus. Some are only about 30 feet (9 meters) in height. But

many eucalypti grow much taller. The giant gum tree of Australia is more than 300 feet (90 meters) tall. Its trunk is about 25 feet (7.6 meters) around.

Eucalypti have long, thin leaves. They are light or dark green. Small flowers grow on eucalyptus trees. They come in many colors, including white, yellow, and shades of red. Eucalypti also have small woody capsules. Inside the capsules are seeds.

Some eucalyptus leaves contain an oil that has a strong smell. The oil is used in medicines, such as cough drops. Eucalyptus wood is tough and durable. It is used to build things such as furniture and fences. The koala, a small Australian mammal, eats eucalyptus leaves.

Euoplocephalus

Euoplocephalus was a plant-eating dinosaur that walked on four legs. It was one of a family called the ankylosaurs. The ankylosaurs all had bony plates on their backs and sides that acted as armor to protect them. *Euoplocephalus* was differ-

ent from most other ankylosaurs because it also had bones that protected the face, including the eyelids.

When and Where *Euoplocephalus* Lived

Euoplocephalus lived during the period of Earth's history called the Late Cretaceous. This lasted from 99 to 65 million years ago. Many *Euoplocephalus* remains have been found in the Canadian province of Alberta and in Montana in the United States.

Physical Features

Euoplocephalus was a powerfully built creature. It grew to about 20 feet (6 meters) in length and probably weighed more than 2 tons. Its body was wide and low to the ground. It walked on legs that were short but thick and strong. Large horns jutted out from the rear of the head and the cheek region of the face. Like all of the ankylosaurs, *Euoplocephalus* had a powerful tail with a heavy club at the end.

Behavior

Euoplocephalus moved very slowly. It depended on the bony plates covering its body to protect it from its enemies. The

Euoplocephalus

club at the end of its tail was used as a weapon in self-defense. When attacked, *Euoplocephalus* could swing its tail with a great deal of force. Like most other dinosaurs, *Euoplocephalus* reproduced by laying eggs.

Euphrates River

Together with the Tigris River, the Euphrates forms a great river system of southwestern Asia. The land between these two rivers is known as Mesopotamia. Some of the world's oldest civilizations—Sumer, Akkad, Babylonia, and Assyria—were established there thousands of years ago.

The Euphrates is the longest river in southwestern Asia. It is about 1,700 miles (2,700 kilometers) long. It begins in the mountains of eastern Turkey. It flows southeast through northern Syria and Iraq. The Euphrates runs alongside the Tigris until the two merge in southeastern Iraq. Together they form a river called the Shatt Al-'Arab. The Shatt Al-'Arab flows into the Persian Gulf.

A fisherman casts his net into the Euphrates River in Iraq.

The Euphrates has two flood periods. One is caused by rains from November to March. The other is in April and May when the snow melts in the mountains in Turkey. But because the land it flows through is very dry, the Euphrates loses much water through evaporation.

The climate along the Euphrates is one of cold in the winter and extreme heat in the summer. Temperatures may fall below freezing in the winter in the higher areas. They may be as high as 140° F (60° C) during summer days in the lower areas.

The Euphrates makes the region livable despite the harsh climate. Water from the river is used for irrigation (artificial watering) of farmland along the riverbanks. People have built many canals to bring water from the river to the fields. Farmers grow grapevines, olives, tobacco, and grains. They also grow dates and other fruits. In fact, Mesopotamia has always been known for its date palms. The Euphrates also provides fish, which are another source of food for the region.

Irrigation • Mesopotamia • Tigris River

Europe

Europe is the second smallest of the world's seven continents. Nevertheless Europe has more people than any other continent except Asia and Africa.

Land and Climate

Europe has scarcely any desert, and a greater proportion of its land is suitable for farming than in any other continent. More than half the land—including much of western and eastern Europe—consists of fairly flat, low plains. In parts of northern Europe glaciers have created a rocky landscape. Southern Europe occupies land that juts into the Mediterranean Sea.

Europe's highest mountains are found in the south. The rugged Alps dominate south-central Europe, while the Pyrenees form a high barrier between Spain and France. Europe's eastern boundary is formed by the low Ural Mountains, which stretch through Russia from north to south. (Western Russia is part of Europe, while eastern Russia lies in Asia.)

Europe has many rivers but few large lakes. The major rivers include the Rhine, Seine, and Rhône in the west, the Po in the south, and the Danube, Elbe, Oder, Vistula, Volga, and Don in the center and east.

Most of western Europe has a moist and moderate climate, while eastern Europe has cold winters and hot summers, especially in the southeast. The winter can

be long and very cold in the far north. The countries near the Mediterranean Sea have hot, dry summers and mild winters.

Plants and Animals

Evergreen forests of pine, spruce, fir, and larch grow in parts of the north and northeast. In the southeast lie areas of grassland. Plants that do not need much water, such as olive and cypress trees, grow in the Mediterranean region. The rest of Europe was once a vast forest, but most of it is now gone. Over the centuries people chopped down trees to make room for farming and other human activities.

Many large animals—even lions—once roamed Europe but have disappeared because of human activity. The gray wolf and beaver now survive only in a few remote areas, and the range of the European bison also has been much reduced. Northern Europe is home to reindeer.

People

Most Europeans are descended from other Europeans, though some Europeans are of African or Asian ancestry. The

Spanish girls in traditional dresses pose for a photograph in Sevilla, Spain. Spain is on the western edge of Europe.

vast majority of the people speak either a Romance language (such as French, Spanish, and Italian), a Germanic language (such as German, English, and the Scandinavian languages), or a Slavic language (such as Russian, Polish, and Czech).

Some form of Christianity is the main religion in almost every European country. Most Italians, Spaniards, Portuguese, French, Austrians, Hungarians, Poles, and Belgians are Roman Catholic. Protestantism is the main religion in Scandinavia, the United Kingdom, and The Netherlands. Eastern Orthodox Chris-

There are many fjords in Norway, which is in northern Europe. Fjords are long, narrow arms of the sea.

tians live in Greece, Russia, and other eastern and southern countries. Jews live throughout Europe, but their numbers were greatly reduced in the Holocaust carried out by Nazi Germany during World War II. Muslims live in many European countries and form the majority in Albania, Bosnia and Herzegovina, and Turkey.

Europe is a world leader in education and health. European governments generally provide health care to all citizens, and on average Europeans live longer than people in many other parts of the world.

Economy

The economies of many European nations are based mostly on services, such as trade, tourism, banking, insurance, and shipping. But producing goods is still very important, and Europe is one of the world's major industrial regions. European factories produce machine and metal products, chemicals, appliances, textiles, drugs, and a great variety of other goods. Western Europe has the most highly developed industries, while southern Europe has less manufacturing than the other regions. Minerals extracted in Europe include coal, iron, iron ore, copper, zinc, lead, aluminum, mercury, titanium, potash, and sulfur.

In most of Europe farming contributes less to the economy than services and manufacturing do. But European farms are very productive. The continent is a great producer of cereals, roots, edible oils, fibers, fruit, and livestock. From

Europe comes most of the world's rye, more than half of the oats, and more than a third of the potatoes and wheat.

History

European civilization first arose in ancient Greece. The Greeks developed ideas about government, philosophy, and the arts and sciences that were followed by many other later societies. According to tradition, the city of Rome (now part of Italy) was founded in 753 BC. Within about 700 years Rome controlled a vast empire. The Romans con-

The Swallow's Nest Castle perches on a cliff above the Black Sea in the Ukrainian city of Yalta.

quered the Greeks but spread many aspects of Greek culture. Beginning in the AD 300s the Romans also spread Christianity. The empire itself spread to the east. In the 400s the western part of the empire, still based in Rome, fell apart.

The Middle Ages lasted from the fall of Rome to about 1500. In place of Roman central government there arose a system of local government called feudalism. A ruler named Charlemagne created a new empire in about 800. Later, from the remains of his empire rose many of the nations of modern Europe.

The Middle Ages were a time of deep religious belief. In 1054 Christianity split into the Roman Catholic church and the Eastern Orthodox church.

The 1500s and 1600s saw a period of arts and learning known as the Renaissance. Meanwhile, many people broke away from the Roman Catholic church during the Protestant Reformation. In the 1700s a period called the Enlightenment stressed the importance of reason-

ing. Its ideas helped fuel the French Revolution of 1789. This revolution helped spread ideas about democracy.

Further change came during the Industrial Revolution, which began in England in the 1700s. Machines made it easier to produce goods. Several European countries also set up large overseas empires. Europe grew wealthy from its industries and its colonies. It came to dominate much of the world.

The first half of the 1900s brought two world wars. Both began in Europe and pitted Germany and its allies against other Western countries. Both brought huge destruction and loss of life.

Following the end of World War II in 1945, most European nations fell into one of two opposing groups. These were the Communist countries of eastern Europe, which were led by the Soviet Union, and the democracies of western Europe. In the early 1990s the Soviet Union broke apart. The countries of eastern Europe began to change to democratic systems.

Beginning in the mid-1900s the countries of Europe created a variety of organizations to help them become more unified. In 1993 one of these organizations became the European Union

European Union

The European Union (EU) was formed to bring together the countries of Europe. The EU helps its member countries with issues such as trade, security, and the rights of citizens. By 2007 the group had 27 member countries.

Structure

The European Union has five main parts. The European Parliament makes laws. The voters of EU countries elect its members. The Council of the European Union is the EU's main decision-making body. It is made up of representatives of the governments of the member countries. The European Commission puts EU policies into action. The Court of Justice holds trials. The Court of Auditors makes sure that the EU's money is managed correctly.

History

After World War II (1939–45) the countries of western Europe wanted to avoid future wars. Some leaders thought that

having their countries work together would help.

In 1952 six countries—France, West Germany, Italy, Belgium, The Netherlands, and Luxembourg—formed the European Coal and Steel Community (ECSC). The ECSC brought together the countries' coal and steel businesses. It was a success.

The ECSC countries then looked for other ways to cooperate. In 1958 they set up the European Atomic Energy Community (also called Euratom) to produce nuclear power together. They also formed the European Economic Community (EEC). The EEC worked to get rid of taxes and rules that limited trade in Europe.

The ECSC, Euratom, and the EEC merged in 1967 to form the European Communities (EC). More countries joined the EC in the 1970s and 1980s. The EC was so successful in economic matters that its members started working together in other ways. In 1991 the members agreed to form the European Union. The EU was officially created in 1993. It added more members in the years that followed.

The EU currency, or form of money, is called the euro. It was introduced in 1999. Most member countries switched from their own currencies to the euro. However, the United Kingdom and some other countries did not. Some countries not in the EU, such as Andorra and Monaco, also use the euro.

Did You Know?

The EU has many offices. The Council meets in Brussels, Belgium. The Parliament meets in Strasbourg, France. The Court of Justice meets in Luxembourg.

The euro replaced a number of national currencies, including the peseta (Spain) and the mark (Germany).

Eurydice

► see Orpheus and Eurydice.

Evaporation and Condensation

Steam from boiling water is actually water vapor. It forms through evaporation.

Evaporation and condensation are two processes through which matter changes from one state to another. Matter is anything that takes up space. It can exist in three different states: solid, liquid, or gas. In evaporation, matter changes from a liquid to a gas. In condensation, matter changes from a gas to a liquid.

All matter is made of tiny moving particles called molecules. Evaporation and condensation happen when these molecules gain or lose energy in the form of heat.

Evaporation

As the sun heats water in a puddle, the puddle slowly shrinks. In a similar way, as water in a pot boils, the level of the water falls. These are two examples of evaporation. The water seems to disappear, but it actually moves into the air as a gas called water vapor.

Evaporation happens when a liquid is heated. The heat gives the liquid's molecules more energy. This energy causes the molecules to move faster. If they gain enough energy, the molecules near the surface break away. These molecules escape the liquid and enter the air as gas.

Condensation

An example of condensation can be seen when drops of water form on the outside of a glass of ice water. The drops seem to appear from nowhere, but they actually form from water vapor in the air. The dew that forms on grass overnight is another example of condensation. Condensation is also the reason that clouds form. Clouds are made up of tiny water droplets, formed from water vapor. The droplets collect around dust or other particles in the air.

Condensation happens when molecules in a gas cool down. As the molecules lose heat, they lose energy. As a result they slow down. They move closer to other gas molecules. Finally these molecules collect together to form a liquid.

Everest, Mount

The highest point on Earth is Mount Everest. Everest is one of the Himalayas of southern Asia. The peak is on the border between Nepal and the Chinese region of Tibet. In Tibetan the peak is known as Chomolungma, meaning “Goddess Mother of the World.”

Mount Everest rises to a height of 29,035 feet (8,850 meters). The air at that height is thin, the temperatures are very cold, and the winds are extraordinarily strong. The conditions near the top are too harsh for any plant or animal life to survive. Huge ice sheets called glaciers cover the slopes down to the base of the mountain.

Some Tibetan-speaking peoples live in the valleys below the mountain. The best known are the Sherpa. They live in villages at altitudes up to about 14,000 feet (4,300 meters). The Sherpa are known for their strength and endurance at high altitudes. They lead climbing trips in the Himalayas.

Snow and ice surround the peak of Mount Everest, the highest point on Earth.

Mount Everest has long been a challenge to mountaineers. Early attempts to reach the summit began in the 1920s. They failed largely because of the harsh conditions on the mountain. The first successful climb took place in 1953. Edmund Hillary of New Zealand and Tenzing Norgay, a Nepalese Sherpa guide, were the first to reach the top. Since then there have been a number of successful climbs.

Everglades

The Everglades is a huge marsh, or wetland, that covers much of southern Florida. It borders the Gulf of Mexico on the west and the Florida Bay on the south. A narrow belt of sandy land lies to the east. The Everglades National Park covers the southwestern part of the

marsh. The Everglades is popular with fishers, boaters, and tourists.

Saw grass, which may grow 10 to 15 feet (3 to 5 meters) tall, covers much of the watery land. Islands called hammocks sit in between stretches of open water. These hammocks are home to trees and shrubs, including palms, pines, cypresses, oaks, and saw palmettos.

The water and the warm climate attract many birds and animals to the Everglades. These include herons, egrets, alligators, snakes, and turtles. The ham-

The Everglades covers more than 4,300 square miles (11,100 square kilometers).

mocks shelter such animals as deer, wildcats, pumas, bears, and many reptiles.

In the past, people drained parts of the Everglades to create farmland. They also built levees (ridges) to prevent flooding in the region. These human activities destroyed much of the Everglades. Today laws protect the marsh from further damage.

Native Americans called the Everglades Pa-Hay-Okee, meaning “grassy water.” They traveled through the marsh in canoes and hunted and fished there. The area’s Calusa Indians disappeared by about 1800. The Seminole Indians moved into the region in the late 1700s.

The Seminole fought a series of wars to keep white settlers from taking over the land. The Seminole finally surrendered to the United States in 1858. Most of them moved west to the Indian Territory, which is now Oklahoma. A small community of Seminole remains in the Everglades.

Evers, Medgar

Medgar Evers was devoted to the struggle for equal rights for African Americans. In the end he gave his life for it. His assassination called attention to racial hatred in the southern United States.

Medgar Wiley Evers was born in Decatur, Mississippi, on July 2, 1925. He

Medgar Evers

served in the U.S. Army during World War II. After the war he studied at Alcorn Agricultural and Mechanical College in Mississippi. At the time African Americans were not allowed to go to the state university in Mississippi.

In the southern United States blacks and whites were kept apart in many ways. This policy was known as segregation. African Americans had fewer opportunities than whites and were usually kept from voting.

Evers wanted to end these injustices. In 1952 he joined the National Association for the Advancement of Colored People (NAACP). In 1962 he helped James Meredith enroll at the University of Mississippi as its first African American student. Evers also campaigned for voting rights for blacks.

On the night of June 12, 1963, Evers was shot to death. The murder shocked the entire country. Afterward, civil rights workers strengthened their efforts. Medgar Evers' work was carried on by his older brother, James Evers.

Byron de La Beckwith, a white segregationist, was tried three times for Evers' murder. He was found guilty in 1994.

Evers was buried in Arlington National Cemetery near Washington, D.C.

Evolution

Evolution is the theory that all the kinds of living things that exist today developed from earlier types. The differences between them resulted from changes that happened over many years. The simplest forms of life arose at least 3.5 billion years ago. Over time they evolved into the more than 2 million species, or types, of living things alive today.

Some people do not accept evolution because of their religious beliefs. The people who are opposed to evolution believe that God or another being created each species in more or less its present form. Instead of evolution, they accept ideas called creationism or intelligent design.

Nearly all scientists accept evolution. This theory is central to the modern science of biology. As a scientific theory, evolution is testable. Scientists have performed many experiments and examined

Over millions of years horses grew in size. At the same time they lost all but one of their toes.

huge amounts of evidence from a variety of scientific fields. The evidence very strongly supports evolution.

Evidence

One type of evidence comes from fossils, or the remains of living things preserved in the ground or underwater. Fossils show that many species that once existed were quite different from any kinds alive today. Dinosaurs are an example of this. Many fossils also show how certain living things changed over time. For example, the bones of horses from more than 50 million years ago show that early horses were about the size of modern dogs. Bones from several later stages of the horse show that they got bigger over time.

Very strong evidence for evolution comes from the study of DNA—the material that carries a living thing's genes. Genes pass along traits, or characteristics, from one generation to the next. The DNA of different species shows that they developed from common ancestors.

Natural Selection

Evolution results from a process called natural selection. This process can happen when an individual's genes differ in some way from the genes of others of its kind. Variations, or differences, in genes cause differences in an individual's traits—such as how it looks, its structure, or its behavior.

These variations occur mostly by chance as genes copy themselves to make new

Longnose hawkfish have evolved to look similar to the coral in their habitats. Their color and shape help them to blend into their surroundings.

cells. Mistakes, called mutations, sometimes occur during the copying process.

Most changes in genes either harm the individual or do not matter much. But some changes help an individual to survive and reproduce. For instance, an animal may have better vision or faster legs. These traits may help it find food and avoid its enemies. A tree may have a gene that causes it to make more seeds. Such useful traits give the individual an advantage over others of its kind. It will be more likely to reproduce and pass its genes along to the next generation. Over time, more and more individuals will have the helpful trait. In this way, living things change over time.

Through natural selection species become adapted, or better fit, to their environments. For instance, a sand-colored gerbil living in a sandy desert blends in with its surroundings. Snakes will be more likely to see and eat gerbils of other colors. Over time the gerbils of

other colors will die out, leaving only sand-colored ones.

History

The English scientist Charles Darwin was the founder of the modern theory of evolution. During a trip around the world, he collected fossils and observed the many variations among living things on a group of islands. From these and other studies, he came to believe that new species developed from earlier forms. In 1859 Darwin published his theory of evolution in an important book called *On the Origin of Species*. He later wrote a book about the evolution of humans.

In the early 1900s scientists used ideas from the new science of genetics to explain in detail how evolution happens. Later advances have allowed scientists to study DNA. These studies help scientists determine how closely related various species of living thing are to one another.

Exercise

Exercise is a way of keeping the body healthy through being active. Another name for exercise is physical fitness. Most people exercise in their spare time. Others have jobs that involve exercise. Sports are some of the most popular ways to get exercise.

Did You Know?

Since Darwin's time many more fossils have been collected, including ancestors of modern humans.

Hiking in the mountains is a good way to get exercise.

Kinds of Exercise

The two main kinds of exercise are aerobic exercise and anaerobic exercise. Sports such as football and basketball are great forms of exercise because they combine both of these types.

Aerobic exercise is energetic movement that lasts for a certain period of time. During aerobic exercise the body combines oxygen with sugar to get more energy. The lungs and the heart work harder to bring in extra oxygen. Swimming, cycling, running, and rapid walking are good examples of aerobic exercise.

Anaerobic exercise is a powerful burst of movement followed by a period of rest. During anaerobic exercise the muscles need more energy than the body can make with its supply of oxygen. After the exercise a person feels out of breath because the muscles have worked with-

out oxygen. Weight lifting, jumping, and sprinting are all types of anaerobic exercise.

Health Benefits

Exercise affects every part of the body in positive ways. It improves balance and coordination. It also improves posture, or the resting position of the body. Exercise strengthens the heart and increases the lungs' ability to take in oxygen. Through exercise the bones and muscles get stronger, and the whole body becomes trim and toned.

Exercise also gives people a greater feeling of well-being. People who exercise generally have a more positive, happy attitude.

Exoskeleton

An exoskeleton is a hard covering that supports and protects the bodies of some types of animals. The word exoskeleton means “outside skeleton.” Many invertebrates, or animals without backbones, have exoskeletons. Insects are the largest group of invertebrates that have exoskeletons.

Insects have exoskeletons made of a substance called chitin. The exoskeletons of crabs, lobsters, shrimp, spiders, ticks, mites, scorpions, and related animals are also made of chitin.

While exoskeletons are hard and stiff, they also have joints, or bendable sec-

A cicada breaks free from the exoskeleton it has outgrown.

tions. These joints allow the animals to move easily. The exoskeletons of land animals also have small breathing holes, which are called spiracles.

As animals with exoskeletons age, their soft inside parts grow. But their exoskeletons do not grow. When an animal's soft body gets too big for the exoskeleton, the exoskeleton splits open and falls away. This process is called molting. The animal's body then forms a new exoskeleton. The animal has no protection while the new exoskeleton is forming.

Many of the invertebrates known as mollusks have a type of exoskeleton called a shell. Mollusks include clams, oysters, scallops, conchs, mussels, and snails. Their shells are made of a substance called calcium carbonate. Mol-

lusks with shells do not molt. As the animals grow, the shells grow, too, along the edges.

Exploration

People throughout history have gone exploring to learn about unknown places. By the beginning of the 21st century most of Earth's surface had been explored. Exploration, however, continues in new directions—thousands of feet below sea level and many miles into space.

Exploration of Earth's Surface

The first known explorer was Hannu, an Egyptian who lived in 2750 BC. He brought riches back from what are now Ethiopia and Somalia. Many other great explorers followed. In the 300s BC Alexander the Great of Macedonia (near Greece) made colonies of the lands he

A monument in Lisbon, Portugal, honors Portuguese discoverers. Throughout history, explorers have been admired for their courage and spirit.

explored, as far away as India. In the AD 1200s Marco Polo traveled from Italy to China.

A great age of European exploration by sea began in the 1400s. Portuguese explorers sailed along the coasts of Africa, Arabia, and India. In 1492 Christopher Columbus sailed west and landed in the Americas. In 1522 Ferdinand Magellan's ship completed the first voyage around the world. In the 1700s the British explorer James Cook reached Australia, Hawaii, and other islands in the Pacific Ocean.

Many explorers traveled inland from the coasts to seek riches, to build settlements, or to spread Christianity. In the process, they met—and often fought with—native peoples. In the 1500s Spanish explorers called conquistadors conquered much of Mexico and South America. Between 1804 and 1806 the Lewis and Clark Expedition explored the western parts of North America. Later in the 1800s David Livingstone and Sir Henry Morton Stanley explored parts of Africa that Europeans had never seen.

Explorers first reached Earth's poles in the 1900s. Robert E. Peary and Matthew Henson were the first people at the North Pole, in 1909. The first explorer at the South Pole was Roald Amundsen, in 1911.

Undersea and Underground Exploration

In 1960 Donald Walsh and Jacques Piccard reached the deepest part of the

A crane lowers a craft called a bathyscaphe into the water in 1959. Auguste Piccard and his son Jacques invented the craft to explore the deep sea.

ocean, 35,800 feet (10,912 meters) down. They were in a craft called a bathyscaphe. Even now, much of the ocean remains unknown. Scientists are still discovering new forms of undersea life.

A huge unexplored region lies beneath the ground as well. Russian scientists drilled the deepest hole into Earth between 1970 and 1989. It was 7.6 miles (12.2 kilometers) deep.

Space Exploration

A human traveler first explored space in 1961. In that year the Soviet cosmonaut Yuri Gagarin orbited, or traveled around, Earth in a spacecraft. On July 20, 1969, the U.S. astronauts Neil Armstrong and Edwin Aldrin became the first humans on the Moon.

Thanks to modern technology, places where no people have gone can still be

Did You Know?

Most of Earth's surface has been explored. But there are many caves just below the surface that are still unexplored.

In 1971 U.S. astronauts spent almost three days on the Moon. They traveled on the Moon's surface using the Lunar Roving Vehicle.

explored. Unmanned spacecraft are operated by radio. These space probes can travel deep into space without having to return to Earth. Space probes have sent back pictures and other information about the planets and other parts of the solar system.

Eye

Humans and other animals use their eyes to see. When people see an object, they actually see light reflecting, or bouncing, off that object. This light enters the eye. The eye changes the light

into electrical signals, which travel through the optic nerve to the brain. The brain interprets, or reads, these signals as an image, or picture, of the object.

The Human Eye

Humans have two eyes. Each eyeball sits in a socket, or opening, in the skull. The skull bone protects the eye on the sides and back. The eyelid protects the front of the eye. By blinking, eyelids also move tears across the eye. Tears keep eyes moist. Eyelashes catch dust and other particles that could enter the eye. Six muscles hold the eyeball in place and move it up, down, and sideways.

The eyeball is filled with a clear jelly. Three coats, or layers, surround this jelly. The outer coat consists of the sclera, or white part of the eye, and the cornea. The cornea is the window of the eye, through which light passes.

The middle coat holds the eye's main blood supply. The iris, or colored part of the eye, makes up the front part of this

The lens of a human eye focuses light on the retina.

coat. Light passes through an opening, called the pupil, in the center of the iris. The iris opens and closes to allow more or less light through the pupil. Behind the iris sits the lens. The lens focuses light onto the inner coat of the eye. The muscle that holds the lens in place also adjusts its shape. To focus on objects that are near, the lens thickens. To focus on objects that are far away, the lens flattens.

Did You Know?

Many animals have two eyes that look in different directions. This makes it harder for enemies to sneak up on them.

The inner coat of the eye is called the retina. Cells called rods and cones are built into the retina. These cells collect light. As the cells collect light, they trigger electrical signals. These signals travel through the optic nerve to the brain.

Problems with the Eye

When the eyeball is too long from front to back, a person cannot see faraway objects clearly. This condition is called nearsightedness. Similarly, farsighted people have trouble seeing nearby objects. Their eyeballs are too short. Glasses, contact lenses, or surgery can correct these problems. Blindness happens when the eye's lens becomes cloudy or when the retina is damaged.

Eyes of Other Animals

Vertebrates, or animals with a backbone, each have two eyes similar to human eyes. But there are differences, which depend on the animal's habitat and behavior. For example, the pupils of animals active at night are often shaped like slits. This allows the pupils to close almost completely to protect the eyes from bright light.

A gecko narrows its pupils to protect its eyes from bright light. Geckos and other animals that are active at night often have slit-shaped pupils.

Invertebrates, or animals without a backbone, have various other kinds of eyes. Some mollusks, including octopuses, have large eyes that are similar to vertebrate eyes. Other mollusks and spiders have simple eyes called ocelli. Insects have compound eyes. These are made up of many lenslike parts. Worms and some protozoans merely have eye-spots that are sensitive to light.

Did You Know?

Many fables feature a sly fox or a cruel wolf. They teach children to beware of people who are sly or cruel.

Fable

A fable is a kind of story that teaches a lesson. Fables are usually entertaining tales featuring animals that talk and behave as people do. Because they have humanlike qualities, the animals show how foolish or wise people can be. For example, “The Three Little Pigs” teaches that hard work is important: The house built by the hardest-working pig is the only one that survives the wolf’s attacks.

Some of the oldest fables came from India and Greece thousands of years ago. Many fables that are familiar in English today—including “The Hare and the Tortoise” and “The Wolf in Sheep’s Clothing”—are said to have been written in ancient Greece by a man named Aesop. These tales have been translated into many different languages. Another famous fable writer was Jean de La Fontaine. His books of fables were published in the 1600s in France. They were admired as literature. Today new fables are still written or adapted from older ones for children’s books and movies.

Falcon

Falcons are birds of prey, meaning that they hunt and eat animals for food. They are swift, powerful fliers. A sport called falconry dates back to ancient times. It involves training falcons to hunt animals in cooperation with humans. Some common kinds of falcons

“The Three Little Pigs” is a well-known fable. A wolf destroys the houses of two pigs, but he cannot destroy a third house. The third pig worked hard to make a sturdy house.

include the peregrine falcon, the merlin, and several types of kestrels.

A kestrel with a grasshopper in its beak perches on a fence post.

Falcons are found nearly all over the world. They live in many habitats, including forests, deserts, grasslands, and even cities.

Usually the female falcon is larger and bolder than the male. Falcons range in size from about 6 to 24 inches (15 to 61 centimeters). The gyrfalcon is the largest of the falcons.

A falcon has sharp claws and a short hooked beak. The beak usually has a small notch called a tooth. These features help it catch and kill prey animals.

A falcon's shape helps it fly quickly. Its body is shaped like a bullet, while its wings are long and pointed. Unlike hawks and eagles, falcons rarely soar and glide. They dive down fast to catch prey. Some falcons capture other birds in

midair. Other falcons kill hares, mice, lizards, and insects on the ground.

Falkland Islands

The rocky and nearly treeless Falkland Islands lie 300 miles (480 kilometers) northeast of the southern tip of South America. The islands are an overseas territory of the United Kingdom. Argentina also claims the islands. It calls them the Malvinas Islands. The capital of the Falklands is Stanley.

Geography

The Falklands include two main islands—East Falkland and West Falkland—and about 200 smaller islands in the South Atlantic Ocean. Hills stretch across the northern parts of

Many penguins live on the Falkland Islands and nearby islands.

both main islands. The climate is chilly, rainy, and windy.

Plants and Animals

Grasses cover much of the land. Seals and sea lions bask on the beaches, while dolphins and whales swim offshore. Black-browed albatrosses and other seabirds soar overhead. Millions of penguins breed on the islands.

People and Economy

Only about 3,000 people live on the islands. Most of them speak English and have British ancestors. Most live in Stanley, which is the only town of any size. The main jobs are fishing and sheep raising. Tourism is also important to the economy.

History

The known history of the Falkland Islands begins with visits by European explorers in the 1600s. The French founded the islands' first settlement on East Falkland in 1764. In 1765 the British settled West Falkland. The Spanish soon took over these settlements. The British returned in 1771 but left in 1774.

Argentina—the South American country closest to the Falklands—claimed the islands in 1820. In 1833, however, the British took over the islands. Argentina never accepted British rule of the Falklands. On April 2, 1982, the Argentines invaded the Falklands. This started the Falkland Islands War. The British defeated the Argentines 10 weeks later.

Despite its defeat, Argentina continued to claim the islands.

Famine

Donations of food from the United States have helped to protect many countries from famine.

A famine exists when large numbers of people cannot get enough food for long periods of time. People in a famine may die from starvation or disease. There have been famines throughout history and in all parts of the world.

Natural disasters, including drought, earthquakes, and floods, can cause famines by destroying crops or by making it difficult to distribute food. Other causes include insects that destroy crops, very cold weather, too much rainfall, and diseases that harm crops or livestock.

Did You Know?

Sheep outnumber people on the Falklands by about 200 to 1.

Wars also may cause famines. Armies may call farmers away. Stored food may go to soldiers. Blocked roads may make it hard to transport food easily.

Some countries have too many people for the amount of available food. These countries tend to be poor. This makes it even harder to deal with famine because they do not have the money to buy food from other countries for their people.

Depending too much on one kind of food can also lead to famine. Ireland used to depend heavily on potatoes. When that crop failed during 1845–49, more than 1 million people died. Producing a variety of foods can help countries avoid famine.

Famines rarely start suddenly. There is usually a warning time during which steps can be taken. Government leaders can store extra food and later give it to hungry people. They can also ask other countries for help.

Fascism

In ancient Rome, the *fascis*—a bundle of rods strapped together around an ax—was a symbol of power. In 1919 the Italian leader Benito Mussolini named his forces *fasci*, after this symbol. Later, Mussolini's style of government became known as fascism. Fascist leaders believe that the strength of the country is more important than the well-being of the people. They rule as dictators, or rulers with unlimited power. They often use violence.

The fasces of ancient Rome consisted of a bundle of rods and an ax strapped together. The Italian leader Benito Mussolini compared his followers to the rods of the fasces. Each rod by itself may be weak, but when many rods are bound together they are strong.

Characteristics of Fascism

Experts disagree about the exact meaning of the term fascism. However, the governments that have been called fascist in the past had certain characteristics in common. Under these governments, the people had few freedoms. They had no voice in the government. Instead, a strong leader controlled everything and became a symbol of the country. The leader built up the police force to punish people who disobeyed. The leader also built up the army and threatened other countries. The leader blamed minority groups for the country's problems.

History

European writers began to introduce fascist ideas in the 1800s. After World

War I (1914–18) many countries faced economic problems. In some, the people were unhappy with the results of the war. Fascists came to power by promising the people power and glory. Mussolini took power in Italy. Adolf Hitler led Nazi Germany. These countries began to build up strong armies. They used the armies to take over other countries. These actions resulted in World War II (1939–45). Italy and Germany fought on the same side during the war. They lost the war, however, and their fascist governments fell.

After the war, the major fascist movement was dead. However, rulers in such countries as Spain and Portugal continued to follow some fascist ideas. Some political groups in other countries—for example, Austria, France, Argentina, South Africa, Libya, and Iraq—also used some fascist ideas. This development was called neofascism, or new fascism.

Feather

Feathers are lightweight growths that cover a bird's body. All birds have feathers, but no other animals have them. According to many scientists, birds developed from reptiles millions of years ago. As the reptiles became birds, their scales became feathers.

Feathers are important to survival, so birds spend a lot of time cleaning and taking care of them. At least once a year

Tiny hooks hold together the feathers on a bird's body.

birds shed their feathers through a process called molting. Then new feathers grow in.

Structure

Like hair, fingernails, and claws, feathers are made of a substance called keratin. Keratin is both lightweight and strong.

All feathers have a stiff stalk, called a shaft, in the center. One end of the shaft, called the quill, sticks into the bird's skin. The rest of the shaft is called the rachis.

Did You Know?

One hundred years ago women decorated their hats with large feathers. Some kinds of birds were almost wiped out by hunters collecting such feathers.

Pairs of stiff branches, called barbs, stick out in both directions all along the rachis. From these barbs grow smaller barbs, called barbules. The barbules have hooks on them. The hooks attach themselves to other nearby barbules so that the feathers hold together on the bird's body.

Some birds do not have these barbules and hooks holding the feathers in place. The feathers of these birds look more like hair.

Types and Uses

Different kinds of feathers have different purposes. Straight, stiff feathers give birds their ability to fly. Tail feathers help with steering, balance, and braking. Small, fluffy feathers, called down, keep a bird's body from getting too cold and its skin from getting wet.

People in many cultures also use feathers. They decorate hats, clothing, and jewelry with colorful feathers. They fill clothing, pillows, and comforters with down for softness and warmth. Some governments protect rare birds from hunters who would kill them for their feathers.

Federalist Papers

The Federalist papers are a series of 85 essays published in 1787 and 1788. Alexander Hamilton, James Madison, and John Jay wrote the essays to explain why the new Constitution would be

good for the United States. Scholars still recommend the Federalist papers to anyone who wants to understand the Constitution.

A group of men wrote the Constitution in Philadelphia, Pennsylvania, in 1787. The Constitution set up a federal system of government. In a federal system the national government and the state governments share power. People who supported the federal system were called Federalists. Other people feared that the new national government would be too strong. They were called Anti-Federalists.

Anti-Federalists were powerful in New York. To get the people of New York to approve the Constitution, Hamilton began writing articles in New York newspapers. Madison and Jay soon joined him.

Most scholars believe that Alexander Hamilton wrote most of the Federalist papers. There is some uncertainty because the authors signed their essays with a made-up name, Publius.

The Federalist papers argued that the new federal government would not be too strong. They explained how the national government would share power with the states. They also explained that the Constitution divided the power of the federal government into three branches. The system called checks and balances would prevent any of the branches from becoming too powerful.

Ferdinand and Isabella

Ferdinand and Isabella were the first king and queen of Spain. They were called the Catholic Monarchs because they strongly supported the Roman

Ferdinand and Isabella

Catholic church. They are also known for sending Christopher Columbus to explore the New World.

Background

Isabella was born on April 22, 1451. Ferdinand was born on March 10, 1452. At that time the land that is now Spain was divided into several kingdoms. Isabella's father was the king of Castile, a kingdom in central Spain. Ferdinand's father was the king of Aragon, in north-eastern Spain. Princess Isabella married Prince Ferdinand in 1469.

Isabella became queen of Castile in 1474, but the king of Portugal also wanted to rule there. Isabella defeated him in war in 1479. In the same year Ferdinand became king of Aragon. Castile and Aragon were then joined under the rule of King Ferdinand and Queen Isabella. The combined kingdom was the beginning of Spain.

Reign

Ferdinand and Isabella banned all religions other than Roman Catholicism. In 1478 they established a court that treated non-Catholics very harshly. The court was called the Spanish Inquisition. In 1492 Ferdinand and Isabella forced all Jews who would not become Catholics to leave Spain.

Ferdinand and Isabella also fought to drive Muslims from Spain. Muslims from North Africa had controlled much of the area since the 700s. Over hundreds of years Christians gradually took land back from the Muslims. In 1482 Ferdinand and Isabella went to

war with Granada, the last Muslim kingdom in Spain. They defeated Granada in 1492. Spain was then a united Christian country.

Later in 1492 Ferdinand and Isabella supported Columbus' first voyage across the Atlantic Ocean. The places where Columbus landed became colonies of Spain. Isabella died on November 26, 1504. Ferdinand died on January 23, 1516.

Fermentation

Fermentation is a chemical change that happens in vegetable and animal substances. For thousands of years people have used fermentation to make bread, wine, beer, cheese, and other foods.

Fermentation often happens through the work of tiny living things called yeasts, bacteria, and mold. These living things create substances called enzymes. The enzymes break down food into chemicals.

When bakers add yeast to bread dough, the yeast breaks down the sugars in the dough. While this happens, carbon dioxide gas is released. The escaping carbon dioxide makes the bread rise.

When winemakers add yeast to grape juice, the yeast changes the juice's sugar

At a soy sauce factory in Japan, soybeans ferment in huge containers called vats.

into alcohol. Beer is another drink made through the fermentation caused by yeast.

People eat many other fermented foods. Cheese comes from milk or cream that has been fermented by bacteria. Soy sauce is made from fermented soybeans. As meat ages it becomes more tender. This is also due to fermentation.

In addition, scientists use fermentation to make certain drugs and vitamins. The drug penicillin is made through fermentation caused by mold.

Enzyme

Fern

Ferns are flowerless green plants. They are usually easy to recognize by the featherlike shape of their leaves, which are called fronds. Ferns reproduce by spores rather than by seeds. Some plants that are called ferns, such as asparagus

A type of fern known as a shield fern grows in a rocky crevice.

ferns, reproduce by seeds and are not true ferns.

There are about 12,000 different species, or types, of fern throughout the world. Some types first appeared on Earth more than 360 million years ago. Ferns commonly grow in tropical rain forests. They also grow in other warm, moist places where there is plenty of shade. Very few species of fern are found in dry, cold places.

Many fern species grow on the trunks and branches of trees. Others grow in bogs and marshes or float on the surface of ponds. Some types of fern, called bracken, spread like a weed through fields and pastures.

Ferns come in a wide variety of sizes and shapes. The smallest ferns are only a fraction of an inch tall. The largest ferns measure from 30 to 80 feet (10 to 25 meters) tall. Young fern leaves are

tightly curled. When they grow and begin to unfurl, they resemble the neck of a violin.

Ferns grow millions of cells called spores on the underside of their leaves. These spores scatter into the air. A small number of them fall on damp surfaces and soils. They grow into tiny, kidney-shaped structures. These structures produce male and female cells, which together produce a new fern.

People often use ferns to decorate their homes and gardens. Such animals as deer eat ferns, and some birds use them to line their nests.

Fertile Crescent

The Fertile Crescent is a part of the Middle East where some of the world's first civilizations began. In ancient times the land there was fertile, or good for growing crops. On a map, the land forms the shape of a crescent moon. The Fertile Crescent extends from the Persian Gulf to the Nile River valley. It

includes the areas known as Mesopotamia and Palestine.

The people of Mesopotamia (now Iraq) may have settled in villages as long ago as 8000 BC. They farmed the land near the Tigris and Euphrates rivers. By about 3500 BC they may have built cities. They also developed governments, laws, and writing. Historians describe such a society as civilized.

Another early civilization arose in ancient Egypt. Soon after 5000 BC people were raising crops using water from the Nile.

Festival and Holiday

People everywhere celebrate special days known as festivals or holidays. Although each festival and holiday has a different purpose, they tend to have some things in common. Many are associated with traditions. These include decorating a tree at Christmas or lighting menorah candles during Hanukkah. Festivals and holidays also bring people together in a variety of ways. For some holidays people join together for solemn ceremonies—such as honoring the war dead on Memorial Day. Other holidays, such as Mardi Gras, are occasions for joyous celebrations.

During the Harbin Ice Festival in China, people visit huge ice structures that are lit up with colored lights.

The word festival comes from the word feast (an elaborate meal). Many festivals were originally connected with the planting or harvesting of crops. Food still plays a major role in many of today's festivals and holidays. The Thanksgiving turkey is an example of a traditional food linked to a holiday.

The word holiday originally meant "holy day." Many holidays are still religious occasions—for example, the Muslim holy month of Ramadan. Other holidays are not religious. For instance, national holidays, such as the Fourth of July in the United States, help citizens to remember their country's history.

Feudalism

Feudalism was a social system that developed during the period called the Middle Ages in Europe. It probably began after the rule of Charlemagne, the leader of a mighty European empire. After Charlemagne's death in 814 his

A painting shows serfs giving animals to their lord.

empire broke into several pieces. No one central government replaced it. Instead people lived in smaller local units or kingdoms. The individual kingdoms faced attacks by Vikings and other people, including nearby kingdoms. The people established relationships within their units that allowed them to live in relative peace.

How Feudalism Worked

To protect themselves, local warlords built castles. They also depended on warriors on horseback called knights.

A lord and his knights formed a bond by swearing oaths of loyalty. The lord gave each knight, also called a vassal, land that was known as a fief. In exchange, the knights vowed to perform military service whenever the lord asked. Eventually the lords themselves became vassals of a king.

Common people, called peasants, were at the bottom of the feudal society. They farmed the land and did the other work that supported the lords and vassals.

Peasants called serfs lived in a village near the lord's castle. They were not slaves, but they were not free to move away. They owed the lord work and payments of food. In return they got protection from outside attackers.

The End of Feudalism

Feudalism developed in times of violence and disorder. The new system brought safety and order. This allowed people to travel and to establish trade. People became more wealthy, and money was used more frequently. Eventually vassals started to pay rent to their lords instead of giving military service. Many lords used the money to hire professional soldiers instead of depending on knights.

By the 1300s feudalism had disappeared almost completely. Europeans created new forms of government that were not based on the fief. Monarchies, or rule by kings, grew stronger.

However, traces of feudalism stayed on in Europe for hundreds of years. Peasants in France owed duties to large landowners until the French Revolution, which started in 1789. In Russia the serfs did not gain freedom until 1861.

Fiber Optics

Fiber optics is a way of sending information through thin fibers, or threads. The information may be sound, pictures, or

computer codes. This information travels through the fibers in the form of light.

The fibers, known as optical fibers, can be made of glass or plastic. They are about as big around as a human hair. Many fibers are bundled together to form a fiber-optic cable. Fiber-optic cables link some telephones and computers. Doctors also use fiber-optic instruments to see inside the human body.

In a fiber-optic system, a machine called a transmitter turns information into light. Then the transmitter sends the light through optical fibers. The inner part of each fiber is called the core. A reflective material surrounds the core. This material is known as cladding.

Optical fibers are as thin as a human hair. They are usually bundled together.

Optical fiber

A layer called cladding keeps light from escaping out of the core of an optical fiber.

The cladding keeps the light moving through the fiber. Light will move in a straight line easily, but it will not turn a corner without help. As the light moves at a high speed through the core, it bounces off the cladding. If the fiber has a bend in it, the light can bounce off the cladding and turn the corner to follow the bend. The cladding also keeps the light from losing its strength. The light can travel quickly over long distances.

At the end of the fibers is a machine called a receiver. It accepts the light. The receiver turns the light back into sound, pictures, or computer codes.

Most telephone cables used to be made of copper wires. Fiber-optic cables are better than old-fashioned copper wires in many ways. Fiber-optic cables are small and light. They can carry a lot of information with little interference. Fiber-optic cables are also less likely to catch fire than copper wires. However,

fiber-optic cables are expensive. They also break more easily than copper wires.

Fibers

Fibers are long, thin strands of material made by plants, animals, or humans. People use fibers to make many useful products. Some examples are brushes, rope, paper, carpets, and textiles (cloth). There are two types of fibers: natural and artificial.

Natural Fibers

Natural plant fibers include rubber and cellulose. Cellulose is the tough part of plants and trees. Natural animal fibers include hair or fur and silk, which caterpillars make to build their cocoons.

Preparing Natural Fibers

Whole natural fibers may be braided, or crossed over and under each other, to make things. For example, people make baskets by braiding grasses, reeds, or twigs. However, many natural fibers are thin or break easily. They must be made thicker and stronger before they can be used to make things. This is done by combining single fibers together.

The most common way of combining fibers is to twist several fibers into thicker threads. People then weave or knit the threads into cloth. People may also form bundles of fibers into yarn, cord, or rope. Felt and paper are made by tangling fibers into a sheet.

Bundles of vegetable fibers from ancient Egypt are displayed in a museum.

Properties and Uses

A natural fiber can be wide and thick or long and thin. It may feel smooth or rough. Some natural fibers are easy to bend, while others are stiff. Silk and cotton fibers are lightweight and soft. Cloth made from these fibers is perfect for clothes, bed linens, and towels. On the other hand, wool can feel rough and itchy. Since wool is very warm, however, it is often used to make sweaters and blankets.

People use natural fibers that are bumpy, rough, and scaly to make heavier objects. For example, straw, jute, and hemp can be woven into mats, hats, rope, and baskets. Bristles (short, stiff animal hairs) work well in hair brushes.

Artificial Fibers

Artificial fibers do not grow in nature. Scientists design them in laboratories, and factories make them out of special chemicals.

An athlete wears clothing made from stretchy artificial fibers.

Making Artificial Fibers

A French inventor made the first artificial fiber, called rayon, in the late 1800s. Rayon is made from plant cellulose that has been changed into liquid form. The liquid cellulose is forced through tiny holes to make long, thin fibers. Acetate and lyocell are other artificial fibers made from plant cellulose.

Scientists later discovered how to make artificial fibers from liquid chemicals. These chemicals mainly come from petroleum (oil) and natural gas. In the 1930s scientists used these chemicals to create nylon. Other artificial fibers made in this way include acrylic, spandex, and polyester.

Properties and Uses

Artificial fibers are strong and tough. Some, especially nylon and spandex, can be stretched like a rubber band. People use them to make clothing, carpets, fur-

niture coverings, rope, and many other products.

Clothing made of artificial fibers became very popular in the 1900s because it was cheaper than clothing made of silk or some other natural fibers. Also, cloth made of artificial fibers does not wrinkle or shrink as cotton does. But cloth made of artificial fibers does not “breathe,” or let air pass through, as much as natural cloth does. This can make such cloth as polyester uncomfortable to wear in hot weather. Many clothes today contain a mixture of artificial and natural fibers. For instance, many cotton jeans and shirts include some spandex so that they stretch better.

Writers use their imagination to create a kind of literature called fiction. They invent characters, put them in a setting, and give them feelings, words, and

Reading stories can be fun.

adventures. Drama and poetry are also based on imagination, but people usually think of them as separate from fiction. Writing that is based on facts is called nonfiction. Examples of nonfiction include biographies, histories, and cookbooks.

Modern fiction comes in two main forms: the novel and the short story. A novel can tell a long and complicated story. It can have many parts—called chapters—and many characters. A novel is usually published in the form of a book. In the past, however, many novels were first published chapter by chapter in issues of a magazine. A short novel is sometimes called a novella.

Short stories are shorter than novels. They usually have fewer characters and only a few important scenes. Short stories often appear in magazines. Sometimes groups of short stories are collected in books.

Fig

Fig trees are grown for their small, pear-shaped fruits, called figs. Figs have a sweet, nutty taste. They also have a chewy texture. The fig tree belongs to the mulberry family. Its scientific name is *Ficus carica*.

Figs grow in hot, dry climates. They are commonly found in the region around the Mediterranean Sea. Turkey is the leading producer of figs. Other impor-

Figs ripen on a fig tree.

tant fig-growing countries are Egypt, Greece, Iran, and Morocco. Farmers also grow figs in the United States, mainly in California.

The fig tree has broad, rough leaves. The tree may be from about 3 feet (1 meter) to 39 feet (12 meters) tall.

The figs that grow on the tree are called fruits, but they are actually inside-out flowers. Each fig is hollow and filled with tiny buds. Seeds sometimes develop from these buds. The skin of a fig may be brown, purple, yellow, or green.

People have been growing figs since at least 5000 BC. They were an important source of food for the ancient Greeks and Romans. Today people eat figs fresh or dried. Most figs sold in stores are dried because the fruit spoils very easily. They also may be canned or used as an ingredient in cookies, pies, or breads. Figs are very nutritious. They contain many important minerals.

Fiji

The country of Fiji is a group of about 300 islands in the South Pacific Ocean. People live on only about 100 of the islands. The capital is Suva.

Geography

Fiji's islands are scattered over about 1 million square miles (3 million square kilometers). Mountains rise sharply from the coasts of the largest islands. Coral reefs surround many of the islands. Each year, Fiji has a hot, wet season and a cooler, drier period.

Plants and Animals

The larger islands have thick tropical forests and mangrove swamps on their eastern sides. Dry grasslands cover the western sides. Most of Fiji's animals, including pigs, dogs, cattle, and horses, are domesticated, or owned by people.

People

Native Fijians make up about half of the population. They are mostly Christians. Most of the rest of the people's ancestors

came from India. Most of Fiji's Indians are Hindus. English, Fijian, and Hindustani are the official languages.

Economy

Fiji's main economic activity is tourism. Fiji also produces clothing, sugar, and gold. Agriculture employs the most people, however. Fiji's main crops are sugarcane, coconuts, taro, cassava, rice, bananas, and sweet potatoes.

History

Fiji's first settlers arrived from other Pacific islands at least 3,500 years ago. Great Britain made Fiji a colony in 1874. The British brought thousands of people from India to work on their sugar estates.

Fiji gained independence in 1970. Since then, tensions between native Fijians and Indians have led to several changes in the government.

Fillmore, Millard

After the death of President Zachary Taylor in 1850, Vice President Millard Fillmore became the 13th president of the United States. Fillmore worked to make a compromise between antislavery Northerners and proslavery Southerners. His efforts led to the breakup of his political party, the Whigs.

Early Life

Millard Fillmore was born in a log cabin in Locke Township, New York, on January 7, 1800. His family was poor. Millard did not attend school regularly because he had to work. After working in a law office, he became a lawyer in 1823. In 1826 Fillmore married Abigail Powers. They had two children.

Political Career

In 1828 Fillmore was elected to the New York legislature. He later served several terms in the U.S. House of Representa-

Millard Fillmore

tives. In 1834 he joined the Whigs, a new political party.

In 1848 the Whigs nominated Fillmore as a candidate for vice president. He and presidential candidate Taylor won the election.

Presidency

Fillmore became president when Taylor died in 1850. The country was close to civil war over the slavery issue. Fillmore

TIMELINE

Fillmore is born in New York State.

January 7, 1800

Fillmore angers Northern states by supporting proslavery laws.

1850

Fillmore becomes president after Taylor dies.

July 9, 1850

1852

Fillmore appoints Matthew Perry to head an expedition to Japan.

Fillmore fails to win a second term.

1852

Fillmore loses election for president as a member of the Know-Nothing Party.

1856

Fillmore dies in Buffalo, New York.

March 8, 1874

personally opposed slavery, but he wanted to preserve the Union. He supported the Compromise of 1850, a series of laws that tried to satisfy the North and the South. One of those laws, the Fugitive Slave Act, said that the federal government must help return runaway slaves to their owners. Fillmore's support of that law angered many Whigs in the North.

In foreign affairs, Fillmore helped world trade by sending an expedition to Japan. The trip led to a treaty that opened Japanese ports to U.S. ships.

Defeat and Retirement

The Compromise of 1850 postponed the American Civil War for 10 years. It also ended Fillmore's political career. In the 1852 presidential election Fillmore and two other Whig candidates lost. In 1856 Fillmore unsuccessfully ran for president as a member of the American, or Know-Nothing, Party.

Fillmore retired to Buffalo, New York. He died there on March 8, 1874.

Finch

Finches are a family of small songbirds. There are several hundred species, or kinds, of finch. They include the canary, the cardinal, goldfinches, and sparrows. Most finches are excellent singers, and many kinds are kept as pets.

The American goldfinch is also called a wild canary. It lives in North America.

Finches live in mild areas in the northern half of the world. They also are found in South America and Africa. In many places finches outnumber all other birds.

Finches are small birds. They range in length from 4 to 11 inches (10 to 28 centimeters). Many have bright colors, often with different shades of red and yellow. Males are usually more colorful than females.

Finches eat the seeds of grasses and weeds. Most use their cone-shaped bills to crack the seeds. Many finches eat insects as well.

Female finches build a nest of twigs, grasses, and roots on the ground or in bushes. Then they lay four or five eggs. Usually the male helps to raise the young birds, called nestlings.

Finland

Finland is a country of northern Europe. For much of its history it was controlled by the neighboring countries of Sweden and Russia. It won its independence in 1917. Today Finland has close ties to its European neighbors. The capital and largest city is Helsinki.

Geography

Finland is bordered by Sweden, Norway, and Russia. The Baltic Sea forms its long coastline. Finland also includes the Åland Islands, which lie off the southwestern coast.

Most of Finland is composed of lowlands, but the northwest is mountainous. Forests cover about three fourths of the land. Finland also has more than 50,000 lakes and numerous rivers. Winters are long and very cold, especially in the north.

The Sami people of Finland have used reindeer to pull their sleds for many years.

Plants and Animals

Pines, spruces, and other evergreens fill Finland's vast forests. The trees of the northern forests are often small in size because of the poor growing conditions. Lichens, moss, and cloudberries grow in the northern swamps. Broad-leaved birch, hazel, and aspen trees grow in the extreme south.

Finland's forests are home to bears, elk, wolves, wolverines, and lynx. The Sami people raise herds of reindeer in the north. The country's birds include Siberian jays, pied wagtails, eagles, and sea-birds. Salmon, trout, whitefish, herring, perch, and pike swim in Finland's waters.

People

More than 90 percent of the country's people are ethnic Finns who speak Finnish. Ethnic Swedes form the largest minority group. There are also a few thousand Sami, or Lapps. Their terri-

© 2006 Encyclopædia Britannica, Inc.

tory, called Lapland, stretches across northern Finland, Sweden, Norway, and Russia. More than 85 percent of the people are Christians, mainly Lutherans. Most people live in cities in the southern third of the country.

Economy

Finland has a diverse economy centered around manufacturing and services, which include banking, communications, education, and health care. Manufacturers produce electronics, paper and wood products, machinery, metals, processed food, and chemicals. Finland's forests provide timber. Its mines provide chromite, zinc, and gold.

Agriculture plays a small role in the economy. Major crops include barley, oats, sugar beets, potatoes, and wheat. Pigs and cattle are the main livestock. Reindeer herding is important in the north. Finland's waters offer good fishing.

History

The first settlement of Finland began about 10,000 years ago. The settlers included the ancestors of the Sami. In the 1100s the Swedes began to convert the Finns to Christianity. Sweden and

Russia fought for political and religious control of the region for many years. The Swedes took over Finland in 1323.

Russia defeated the Swedes in 1721, but Sweden did not officially surrender Finland to Russia until 1809. In 1917 the Russian Empire collapsed as a result of the Russian Revolution. Finland declared itself independent that year. It became a republic in 1919.

World War II (1939–45) was disastrous for Finland. The country lost large pieces of territory to the Soviet Union at the beginning of the war. In 1941 Finland sided with Germany against the Soviet Union and won back its lost territory. However, Soviet forces again defeated Finland in 1944. Finland was forced to give up more territory.

After the war, the economy grew and social conditions improved. Finland joined the European Union in 1995. In 2000 Tarja Halonen was elected Finland's first woman president.

Fir

Firs have needlelike leaves that grow directly from the branch.

Firs are evergreen trees of the pine family. They are valued for their wood and are popular as Christmas trees. There are more than 40 species, or types, of fir. They belong to the group that scientists call *Abies*.

Firs grow in moist, cool areas of North and Central America, Europe, Asia, and northern Africa. In North America many firs grow in the mountains of the West. The balsam fir is a well-known type in eastern North America.

Fir trees can be anywhere from 17 feet (5 meters) to 200 feet (60 meters) tall when fully grown. The leaves are like needles. Each needle grows singly from the branch. This makes firs different from pines, which have needles that grow in bundles. Fir needles are bright green to blue-green on the top and

white or silvery green on the bottom. They are flat and usually have rounded tips.

Firs belong to the group of plants called conifers. Conifers have cones that hold their seeds. Fir cones stand up on the branches like candles. They may be purple, brown, or green.

Many evergreen trees that do not belong to the group *Abies* are also called firs. For example, Douglas firs belong to the group *Pseudotsuga*. Unlike the true firs, Douglas firs have cones that hang down. These trees are common in North America along the coast of the Pacific Ocean. They are a valuable timber tree.

Fire

Humans have controlled and used fire for more than 1 million years. Civilization would not be possible without fire.

Many people have fireplaces in their homes. They enjoy looking at the fire as well as the warmth that it provides.

Fire is used in many factories to operate furnaces or heat boilers. In a steel mill it is used to melt the materials that go into making steel.

However, fire is dangerous. It always must be used very carefully.

How Fire Happens

Fire comes about when oxygen combines in a certain way with some other substance. Oxygen is a gas that is a part of air. The other substance is called the fuel. For the fuel to combust, or burn, it must be heated to a temperature called the ignition point. Every kind of fuel has its own ignition point.

A flame is created when heat forces gases from a burning substance. When the gas from a candle's hot wax meets the air, for example, a flame is made. A substance that does not release gas when heated will burn without flames. When the oxygen is used up, the fire will go out. For example, when a candle's flame is covered, the flame will go out after it has used the remaining oxygen in the space beneath the cover.

History

Human beings have known how to control fire for almost 1.5 million years. But for many thousands of years after that, people still found it difficult to start a fire. One method they used was to strike one hard mineral against another to make sparks. A second method was to twirl one piece of wood against another until the wood heated up to its ignition point.

Early humans had many uses for fire. Campfires kept people warm and scared off wild animals. Fire lit the way at night and in caves. Fire also cooked food.

Eventually, people used fire in new ways. They set fires to clear land for farming. They used fire to make pottery from clay. By about 3500 BC people were using fire to shape metals. As the centuries passed, people learned to use fire to make such things as steam, rubber, and bricks.

Civilization • Combustion

Firefighting

Fire is useful to humans, but it is dangerous as well. Fires kill thousands of people each year and destroy much property. The people who put out fires are called firefighters. Firefighters also work to prevent fires and teach fire safety.

A fire must have fuel, oxygen, and heat in order to burn. Firefighters put out fires by removing at least one of those

Did You Know?

Early humans did not know how to start a fire. They had to get fire from trees struck by lightning or from volcanic eruptions.

Firefighters wear protective clothing because their work is sometimes dangerous.

three ingredients. For example, they take fuel away from a forest or brush fire by clearing away trees and bushes in the path of the fire. They take oxygen away from a grease fire by smothering it with foam from a fire extinguisher. They reduce the heat of a burning building by spraying water over it.

Fire departments (also called fire brigades) date back to ancient Rome. Today almost all large and medium-sized cities have full-time fire departments. Volunteers staff many small fire departments.

Firefighters use several kinds of equipment at a fire. Pumper trucks carry powerful pumps and long hoses to shoot water at the fire. Ladder trucks and elevating platforms are equipped to rescue people and fight fires in tall buildings. Tanker trucks carry water to places that have no water pipes nearby. Airplanes and helicopters are used to drop water or chemicals on forest fires. Many fire departments also provide ambulance service for fire victims.

Deaths from fires have dropped in recent years. More buildings now use construction materials that do not burn easily. And more buildings now have automatic water sprinklers. However, in case a fire does break out, people should know how to contact their fire department. They also should know where emergency exits are and how to escape a burning building safely. Plus, every home should have fire extinguishers.

Firefly

In many places the insects called fireflies are a familiar sight on summer nights. They are noticeable because they can produce flashes of light. Fireflies belong to the beetle family. They are also called lightning bugs.

There are about 1,900 species, or types, of firefly. They live in tropical and mild parts of the world. They generally like warm, humid areas, but some live in dry places.

A firefly lights up.

Adult fireflies range in size from 0.2 to 1 inch (5 to 25 millimeters) long. They have a soft, flattened body that is dark brown or black, sometimes with orange or yellow marks. Males have wings and are good fliers. Females either have short wings or no wings. The females without wings are often called glowworms. Young fireflies, which also have no wings, are also called glowworms.

Fireflies produce light with special organs, or body parts, on the underside of the body. These organs make light by mixing chemicals with oxygen from the air. Fireflies make a certain series of flashes to attract a mate. When a possible mate sees the flashes, it returns the signal.

Fish

Fish are a kind of animal that lives in water. Fish have lived on Earth for more than 450 million years. There are more than 24,000 species, or kinds, of fish. New ones are discovered every year.

Where Fish Live

Fish live in lakes, rivers, seas, and oceans around the world. They live in all kinds of water, from warm springs to cold Arctic seas. Fish can even be found in the dark pools of underground caves.

Physical Features

The many different kinds of fish have some things in common. They are all

Yellowspot emperor fish swim in a group called a school.

vertebrates, which means that they have a backbone. They are cold-blooded, which means that their body temperature changes along with the temperature of their surroundings. Fish generally breathe through organs called gills. They usually have pairs of fins in place of arms and legs. Most fish are covered with scales.

But fish also show great variety. Gobies, the smallest fish, can be less than half an inch (13 millimeters) long. The whale shark, the largest fish, can be 50 feet (15 meters) long and weigh 20 tons. A typical fish is wider in the middle than at the ends. But a flounder is as flat as a dinner plate. A sea horse looks something like a horse standing on its tail. Eels look like snakes.

Over millions of years, some fish have developed unique features to help them survive. These features are called adaptations. For example, the anglerfish carries its own “fishing rod” to catch other fish. An extended part of the back fin has wormlike pieces of flesh at the tip,

A diver swims with a whale shark, the largest of all living fish. The whale shark is harmless to humans.

which are the “bait.” Anglerfish of the deep sea have bait that lights up to attract victims.

Behavior

Fish swim mainly by sideways movements of the body and tail. They use their fins for balancing, steering, and braking. To move quickly from a resting position, some fish shoot a stream of water out of the gills, which causes them to lunge forward. The fastest swimmers, such as the tuna, can travel 30 miles (48 kilometers) per hour.

Many fish have adaptations to help protect them from enemies. For example, some fish have spots near their tail that look like eyes. When an enemy strikes at what it thinks is the head, the fish can escape quickly. Other fish can change color and pattern to match their surroundings and hide themselves from enemies.

Most fish eat other, smaller fish. The smallest fish eat tiny water plants and

animals called plankton. Plankton also includes fish eggs. It drifts with the currents in large numbers.

Reproduction

All fish hatch from eggs. Usually the females release eggs and the males release sperm into the water. When the eggs and sperm meet, the eggs are fertilized. Many of the eggs, and the young that hatch from them, are eaten by other fish. To increase the chance that some young will survive, some females release as many as a million eggs.

Some kinds of fish try to protect their eggs. The female might dig a nest in the sandy bottom and lay her eggs there. The female sea horse lays her eggs in a pouch on the belly of the male, where they stay until they hatch. Some male catfish carry the eggs in their mouth.

Sometimes the eggs are fertilized in the female’s body and hatch there. Then the young are born live from the female. Fish born this way have a better chance

An anemone fish shelters in the tentacles of a poisonous sea anemone. The poison does not hurt the fish.

of survival. Guppies and some sharks have live births.

Fish and Humans

Fish are valuable to people in a number of ways. In many places fish are a major source of food. Also, people keep fish as pets in home aquariums. Some people enjoy fishing as a sport. However, too much fishing by commercial boats has greatly reduced the number of certain fish. Fish are also harmed by pollution.

Flag

A flag is a piece of cloth or other material that carries a design. A flag is often attached on one side to a pole or a stick,

called a staff. Every country and state has its own flag. Some cities, groups, and people have flags as well.

A flag is a powerful symbol. People show a flag the same respect that they show to the country or group it represents. Many governments have laws about flag use.

Flags of Countries

Betsy Ross may have sewn the first U.S. flag in 1776. Since then the U.S. flag has changed many times. The flag now in use has 50 stars that stand for the 50 states. Its 13 stripes stand for the 13 original states. However, no state has its own particular star or stripe.

The flags of other countries also have meanings. Most flags of Islamic countries use the crescent moon, the color green, or both. These are symbols of

13 stars, 1777–95

50 stars, 1960

The earliest U.S. flags had the 13 stars arranged in different patterns. A new star was added for each new state that joined the country. Since 1960 U.S. flags always have the same pattern of 50 stars.

The modern flag of the United Kingdom combines symbols of England, Scotland, and Ireland.

Islam. Many of the traditionally Christian countries of Europe have a cross (the symbol of Christianity) on their flags.

numbers or letters. People use sets of these flags to send messages over a distance.

Special Flags

Flags may serve special purposes. A flag honors the dead when it flies halfway down the pole. A yellow flag is a warning of contagious, or catching, disease. A white flag in a battle is a call to stop the fighting. An upside-down flag on a ship is a call for help. Some flags have designs that stand for

Flag History

The people of ancient China and India used some of the first flags. These early flags often flew over armies in battles. If a flag fell, it meant that the commander had been captured or killed.

Ancient Roman soldiers on horseback carried a square piece of fringed cloth at the end of a spear. Later, European

Flamingo

Flamingos are tall, mostly pink birds with long legs. A flamingo often stands with its long, thin neck curved into an S shape. Flamingos fly and feed in large flocks of hundreds to even millions of birds.

Flamingos are known for their pink color and curved necks.

Like storks, herons, and ibises, flamingos are wading birds. This means that they feed while standing or walking in shallow water. Flamingos live in warm regions near lakes and bodies of water called lagoons.

There are five species, or types, of flamingo. The most common type is the lesser flamingo. It is found mainly in eastern and southern Africa and India. Other types of flamingo come from Central and South America, Caribbean islands, southern Europe, Africa, the Middle East, and southern Asia.

A flamingo has webbed feet, a slender body, large wings, and a short tail. Its head is small, and its bill curves downward. It stands between about 3 feet (almost 1 meter) and 5 feet (1.5 meters) tall.

Flamingos eat tiny living things such as algae and small animals such as shrimp, snails, crabs, and mollusks. A flamingo gets its food by plunging its head down into shallow water or mud. It twists its head upside down and sucks water into its bill. The bill has a series of hairlike plates inside that act as a filter. The bird uses its bill to strain food from the water.

Flathead

The Native Americans known as the Flatheads traditionally lived in what are now western Montana and eastern

Did You Know?

When first hatched, a flamingo has white and gray feathers. Its color changes to pink because of the food it eats.

Charlot was a great chief of the Flatheads in the 1800s.

Idaho. They called themselves the Salish. This name is now used for a group of tribes that speak similar languages. Outsiders called them Flatheads even though they did not flatten the foreheads of their babies with boards, as some related tribes did.

The Flatheads got most of their food by hunting and fishing. By the early 1700s they obtained horses. They then traveled long distances on horseback looking for bison (buffalo).

Flathead families lived in long houses or tepees. They made their long houses by covering wooden poles with bark or woven mats. They covered their tepees with grass, bark, or earth.

In the 1700s many Flatheads died of smallpox, a disease that European explorers passed on to the tribe. Many other Flatheads were killed in wars with other tribes. In 1855 the U.S. government forced the surviving Flatheads to move to two small reservations. Later

the tribe was forced to give up one reservation. This left them with only the Flathead Indian Reservation near Missoula, Montana. Today they share its land with several related tribes. At the end of the 20th century there were about 3,500 Flatheads.

Flea

Fleas are insects that live as parasites on birds and mammals, including humans. Like other parasites, fleas depend on the animal they live on for food. Fleas bite the animal to feed on its blood. They can spread diseases by biting an infected animal and then biting a healthy animal.

Fleas live throughout the world, in polar, mild, and tropical regions. There are about 1,600 species, or kinds, of flea.

Fleas are tiny. The largest are only about 0.4 inch (1 centimeter) long. Fleas have a thin, flattened body that is dark reddish brown. They use their long, sharp beak to pierce an animal's skin and suck its blood. Fleas do not have wings, but they have strong legs and are excellent jumpers.

A flea settles into the fur of a dog.

A flea has four stages of life: egg, larva, pupa, and adult. A female flea can lay more than 20 eggs every day. An egg develops into a larva, which looks like a legless caterpillar. The larva molts (sheds its outside covering) two or three times. Then it spins a cocoon to begin the pupa stage. The pupa develops into an adult a few days or months later, depending on the species. Adult fleas live for a few weeks to about a year.

Flood

When water overflows onto dry land, a flood takes place. Floods have always been a part of life on Earth. Almost every culture has a legend about a great flood. Since ancient times people have built their cities along rivers because they use the water for drinking and for farming. River floods therefore affect many people. In some places people have built dams or levees to protect lands from river flooding.

Floods can be dangerous and destructive. However, floods are not always bad. When muddy floodwaters go down, they sometimes leave a layer of rich, moist soil. People in ancient Egypt depended on the flooding of the Nile River every year to help them grow their crops.

Causes

Most often flooding is caused by heavy rains over a long period of time. After a lot of rain, the ground becomes full of water, and new rainwater runs off, or

Cars are useless in a flooded street.

flows downhill. That runoff goes directly into streams and rivers. In springtime the rain may be combined with melting snow. Because of the extra water flowing into the streams and rivers, their water level rises. If the level rises so much that the water overflows the banks, a flood occurs.

Flooding can be worse if there is not much vegetation (trees, grass, and other plants) on the land around rivers. In general, land that has little vegetation is less able to absorb water. The result is a larger amount of water entering a river system.

Flash Floods

Flash floods are the deadliest kind of flood. They are caused by sudden heavy rainfall or a broken dam. They happen very quickly and can catch people before they have a chance to escape. Flash floods often occur in hilly country or around dry riverbeds. In a flash flood a completely dry riverbed can fill up in minutes.

Florida

The U.S. state of Florida is nicknamed the Sunshine State

because it has so many sunny days. Other nicknames include the Orange State, the Peninsula State, the Alligator State, the Southernmost State, and the Everglades State. Its actual name is the Spanish word for “flowery.” The capital is Tallahassee.

Geography

Florida is on the southeast coast of the United States. Georgia and Alabama border the state on the north, above the area of Florida known as the Panhandle. The Atlantic Ocean is on the east. On the west are Alabama and the Gulf of Mexico.

The Straits of Florida connect the Gulf of Mexico and the Atlantic Ocean. This body of water also separates Florida from Cuba. The Florida Keys are a chain of tiny coral and limestone islands. Key West, on the Florida Keys, is the coun-

try's southernmost city (outside Hawaii).

Flat plains border the entire coast. In the center of the state broad plains, rolling hills, and thousands of lakes stretch from the Georgia border south through the center of the state. A low plateau rises in the northwest. Forests once covered most of Florida's land area, but many trees were cut down to build cities. In the south lies Everglades National Park. The park is a vast wilderness area of swamps and forests. The state's largest rivers are all in the north. The Saint Johns River is the longest, stretching for 285 miles (459 kilometers).

Florida is known for its warm, sunny climate. While cold spells sometimes occur in the winter, they rarely last more than three or four days. The heaviest rainfall occurs between May and October. Hurricanes can be a problem.

People

Florida has a diverse population. Many senior citizens move to Florida after their retirement to enjoy the weather.

People from nearby island countries such as Cuba and Haiti sometimes go to Florida to escape political or economic problems. Hispanic Americans make up more than 15 percent of Florida's residents. About the same percentage of people are African Americans. Some Seminole Indians live on reservations in southern Florida. The rest of the population is primarily of European descent.

Jacksonville is the largest city in the state. It is a seaport and business center. Miami, the second largest city, is a winter resort and a manufacturing center. Tampa is a port on the Gulf of Mexico.

Orlando is a popular vacation spot. It has many theme parks, including Walt Disney World and Sea World. Many cities, including Key West, Palm Beach, Fort Lauderdale, and Daytona Beach, attract visitors with their beaches.

Many people gather at sidewalk cafés in the South Beach section of Miami, Florida.

A group of children examine starfish in the clear waters near Honeymoon Island. The island is one of the many popular recreational areas in the U.S. state of Florida.

Economy

Trade and tourism bring a great deal of money into Florida's economy. Many people hold service jobs, including at hotels and restaurants, as well as at finance and insurance companies. Companies in Florida manufacture food and paper products, electronics, and chemicals. Florida is also a leader in the aerospace industry. The John F. Kennedy Space Center at Cape Canaveral employs thousands of people.

Crops grow year-round in Florida. Florida is a leading grower of citrus fruits, including oranges and grapefruits. Farmers also grow other fruits, vegetables, tobacco, cotton, and sugarcane. They raise cattle, poultry, and horses. Fishers catch fish and shellfish in Florida's many waters.

History

When the explorer Juan Ponce de León arrived in Florida in 1513, he claimed the land for Spain. In 1528 another

The space shuttle *Discovery* launches from the John F. Kennedy Space Center at Cape Canaveral, Florida, in July 2006.

Spanish explorer named Pánfilo de Narváez reached Tampa Bay. Hernando de Soto sailed into Tampa Bay in 1539.

In 1562 French Protestants called Huguenots went to Florida so that they could freely practice their religion. More French colonists followed, but many of them were killed when Spanish explorer Pedro Menéndez de Avilés captured their fort. In 1565 Menéndez founded Saint Augustine, the first permanent European settlement in what is now the United States.

Spain gave Florida to Great Britain in 1763. Spain regained control after the American Revolution ended in 1783. Then the United States and Spain disagreed on land boundaries in Florida. In 1819 Spain finally agreed to give up Florida. Meanwhile, the United States

began fighting the Seminole Indians of Florida. By 1858 most of the Seminole had been forced to move west.

Florida entered the Union in 1845 as the 27th state. In 1861, at the beginning of the American Civil War, it left the Union to join the Confederacy because many of its citizens supported the right to own slaves. Florida was readmitted to the Union in 1868.

In the 1880s railroad building opened the state to settlers and a new tourist trade. Better transportation made Florida the winter vegetable and citrus center of the East. In the 1900s many more people moved to Florida. The state prospered as the economy grew.

Florida Keys

The Florida Keys are a chain of about 60 islands off the coast of southern Florida. The chain begins in the Atlantic Ocean just south of Miami Beach. From there it curves southwestward into the Gulf of Mexico. The chain is about 220 miles (355 kilometers) long.

The largest of the keys is Key Largo. It is about 30 miles (48 kilometers) long and less than 2 miles (3 kilometers) wide. Key West is a small island at the western end of the chain. The city of Key West spreads over the island. It is the southernmost city in the United States outside of Hawaii.

Mangrove trees line the shores of the keys. Tropical hardwood trees and palms grow on higher ground. More than 600 types of fish live in the waters around the keys. John Pennekamp Coral Reef State Park, off Key Largo, contains the largest living coral formations in North America.

Tourism and fishing are the most important economic activities of the keys. A

Flower

A flower is the part of a plant that blossoms. Flowers produce the seeds that can become new plants. Most plants, including many trees, grow some kind of flower.

Physical Features

Flowers vary widely in their shape, size, color, and scent. Many types are small and barely noticeable. The blossoms that most people think of as flowers are those that are colorful and showy.

A flower usually has four main parts. These are the calyx, the corolla, the stamens, and the pistils. All of these parts are usually bunched together at the tip, or receptacle, of the flower stem.

The calyx is the outermost part of a flower. It is made up of sepals. The sepals are usually green and look like small leaves. The sepals enclose and protect the flower bud while it is developing into a flower.

The flower's petals form the corolla. Within the corolla are the stamens and the pistils. The stamens are the male parts of a flower. They produce tiny grains called pollen. Pollen grains contain sperm cells. The pistils are the female parts of a flower. The pistils contain egg cells that can develop into seeds. Some flowers have both stamens and pistils. Others have either stamens or pistils.

Pollination

Pollination is the process by which flowers form seeds. This is how plants reproduce.

There are two main kinds of pollination: self-pollination and cross-pollination.

Parts of a Flower

The main parts of a flower are the calyx, the corolla, the stamens (male parts), and the pistils (female parts). Some flowers have only stamens. Others have only pistils.

A garden in The Netherlands features flowers of many shapes and colors.

Self-pollination is the transfer of pollen from a stamen to a pistil on the same plant. This can happen within one flower or between different flowers on the plant. Cross-pollination is the transfer of pollen from a flower on one plant to a flower on another plant.

Flowers depend on carriers for cross-pollination. Carriers are things that carry pollen from one plant to another. They include the wind, insects, birds, and other animals.

After a grain of pollen lands on a flower's pistil, fertilization occurs. That is, a sperm cell from the pollen enters the egg cell in the pistil. The fertilized egg then grows into a seed.

Uses

Flowers are symbols of beauty in most cultures of the world. Many people give

flowers as gifts. People also use flowers as decorations during holidays and at weddings and other ceremonies. Flowers with a lovely scent may be made into perfume.

Fly

Many kinds of small flying insects are commonly called flies. But scientists use the term fly only for the insects in a group they call Diptera. These “true” flies usually have a single pair of wings. Most other insects, including some that are called flies, have two pairs of wings. Instead of a second set of wings, true flies have knoblike structures that help them balance while flying.

There are about 85,000 species, or kinds, of fly. They include houseflies, horseflies, fruit flies, gnats, and mosquitoes. Flies live everywhere in the world except near the ice caps of the North and South poles.

Flies range in size from just 0.05 inch (1 millimeter) to 3 inches (8 centimeters) long. The common housefly is about 0.25 inch (0.64 centimeter) long. It has three pairs of legs and five eyes. Two of the eyes cover most of the head.

Flies eat a variety of things. Most get food from flowers. This food includes the dustlike substance called pollen and the syrupy liquid called nectar. Flies feed on living plants as well as rotting plants and animals. Flies that can bite, such as

A housefly feeds on a doughnut.

mosquitoes, suck blood from animals. Flies also eat dung.

Flies can be very harmful. They can spread diseases by carrying germs on their hairy bodies. Some flies can spread disease through their bites. Flies can also damage crops.

Flying Fish

The unique fishes called flying fish appear to soar above the water. But they do not actually fly by flapping wings, like birds do. Instead, they jump from the water and use their fins to glide through the air.

Flying fishes live in warm seas throughout the world. There are about 40 different species, or types.

Flying fishes are usually less than 18 inches (45 centimeters) long. The typical flying fish is deep blue on the back and sides and silvery underneath. It has

A flying fish shows the fins that it uses to soar in the air.

a long, narrow body with large, winglike fins attached to the sides. Some species also have fins on the underside of the body.

Scientists believe that flying fishes “fly” to escape predators. To do so, the fish first builds up speed underwater. It folds its fins against its body while swimming toward the surface. As the fish breaks the surface it spreads its fins, which act as wings. It also rapidly beats its tail, which is still underwater. This lifts the fish out of the water and lets it glide above the surface. Some fish can go as far as 600 feet (180 meters) in a single glide.

Fish

Fog

Tiny water drops hovering in the air are called fog. Fog is like a cloud, but it is near the ground, not high in the sky. Thick fog makes it difficult to see the surrounding landscape.

Fog forms from water vapor, which is water in the form of a gas. Water vapor in the air condenses, or turns back into liquid, when the air cools. Fog appears when this liquid gathers around bits of dust in the air. A gentle wind helps fog to form and to stay in the air. If the water vapor condenses on the ground instead, it is called dew.

Fog is very common in valleys and near bodies of water. It usually forms at night, when the air cools down. As the air warms in the morning, the fog evaporates, or dries up. In colder places fog may last all day. Wind and tall objects, such as trees and buildings, can break fog into patches.

Fog also forms when warm air blows slowly over a cool ocean or a lake. This kind of fog can also develop over snow or ice. Cold air passing over warm land or water may also form fog, as can rain falling from warm air to cool air near the ground.

Folk Music

The music and songs of common people are called folk music, or traditional music. Folk music exists around the world, often in rural areas.

Most folk music includes singing and instrument playing. There are many forms of folk songs. A ballad tells a story. A lullaby is a child's bedtime song. A spiritual is a religious song. Folk musicians use many kinds of instruments. Some are simple, such as rattles and whistles. Others, such as fiddles and guitars, are also used to play classical music.

Once a person makes up a folk song, people in the community learn it. No one writes down the song at first, so people often change it as they perform it. The song may spread to nearby towns and even other countries, where it changes further. Regions in Europe, for example, all have their own styles of folk music, but many of the tunes are similar.

Young folk musicians perform in Budapest, Hungary.

European immigrants and African slaves brought folk music to the Americas. In colonial America and the early United States, folk music was an important part of daily life. Pioneers sang as they traveled west. Slaves sang in the cotton fields of the South. Workers sang as they laid railroad tracks. Cowboys sang as they herded cattle.

In the 1960s a new kind of folksinger developed. Popular musicians, such as Bob Dylan, sang traditional folk songs and mixed folk music with rock and roll. These singers made folk music popular with young people.

Folktale

Folktales are a kind of story that gets passed on from generation to generation. True folktales do not have a single author. They develop as different people tell them over time. As such, they are creations of “the folk,” or the people. Many folktales are very old. For generations the tales were spoken aloud and never written down. Storytellers would memorize the stories and keep them alive.

Modern authors may write their own versions of popular kinds of traditional tales, such as fables and fairy tales. Also, folktales that began as ancient spoken stories may now be written down in books. For example, the stories called the *Arabian Nights* were told aloud long ago in many places in the Middle East

Did You Know?

European art music, also known as classical music, often borrows tunes from folk music.

Did You Know?

A collection of Indian folktales about animals called the *Panchatantra* was written perhaps 2,000 years ago.

and elsewhere. A variety of entertaining stories in the group tell of characters such as Aladdin, Ali Baba, and Sinbad the Sailor. People began collecting and writing down these colorful tales more than 1,000 years ago.

Subjects

Folktales tell about many different parts of life. They may tell about joys and sorrows, animals and magic beings, and heroes and villains. They can be scary, funny, or exciting. Different types of folktales may entertain or teach a lesson. They may also try to explain things that people do not understand. Myths are similar to folktales. They are traditional stories about a culture's beliefs about life.

Different cultures tell different stories. However, some similar themes appear in folktales told in many different places and cultures. For example, folktales about clever “tricksters” are common in western Africa, the Americas, and other places. Trickster tales usually involve a weaker animal using its wits to get the better of a stronger one.

Stories of heroes are also common in many cultures. Heroic tales help bind a people together and help them remember their history. For example, King Arthur and the Knights of the Round Table are the heroes of many French and English legends.

Fables

A fable is a type of folktale that teaches a lesson. Fables are usually entertaining tales featuring animals that talk and

Anansi the spider is a trickster character that appears in many western African folktales. In one story he lures a swarm of hornets into a gourd, where he will trap them.

behave as people do. Because they have humanlike qualities, the animals show how foolish or wise people can be. For

example, “The Three Little Pigs” teaches that hard work is important: The house built by the hardest-working pig is the only one that survives the wolf’s attacks.

Some of the oldest fables came from India and Greece thousands of years ago. Many fables that are familiar in English today are said to have been written in ancient Greece by a man named Aesop.

Fairy Tales

In the story of “Little Red Riding Hood” a wolf tries to trick a young girl by dressing up as the girl’s grandmother.

Fairy tales are a kind of folk story about magical events and creatures. They often tell about a young person meeting fantastic beings such as fairies, witches, giants, or dragons. Stories such as “Cinderella,” “Little Red Riding Hood,” and “Sleeping Beauty” began as spoken folktales with no one author. Two German brothers called the Brothers Grimm collected and wrote down many fairy

tales in the 1800s. Some modern writers, such as Hans Christian Andersen, invented their own fairy tales.

Food and Nutrition

Plants make their own food with the sun’s help. Animals, including humans, do not. Instead they eat food—plants or other animals—to get what their bodies need to live and grow. Nutrition is the science of how the body uses food.

Calories

Food gives the body the energy it needs for everything it does, from repairing damaged cells to sleeping. The amount of energy a food can produce is measured in calories.

Nutrients

Food also provides the nutrients that the body needs to function and maintain itself. These nutrients are proteins, carbohydrates, fats and oils, minerals, vitamins, and water.

Proteins are needed for body tissue to grow and repair itself. Carbohydrates give the body most of the energy it needs. Starches and sugars are carbohydrates.

Did You Know?

If a person takes in more food than the body needs, the extra calories are changed into fat—a stored form of energy.

The body uses fats to maintain its temperature and to cushion organs. Fats also help the body use certain vitamins. But fats can also be harmful. For example, some kinds of fats can raise the level of cholesterol in the blood. Cholesterol is an important substance in the body. However, when the body has too much cholesterol, the extra begins to build up in the walls of the blood vessels. This gradually narrows the blood vessels so that blood cannot flow freely through them. This may lead to a heart attack or stroke.

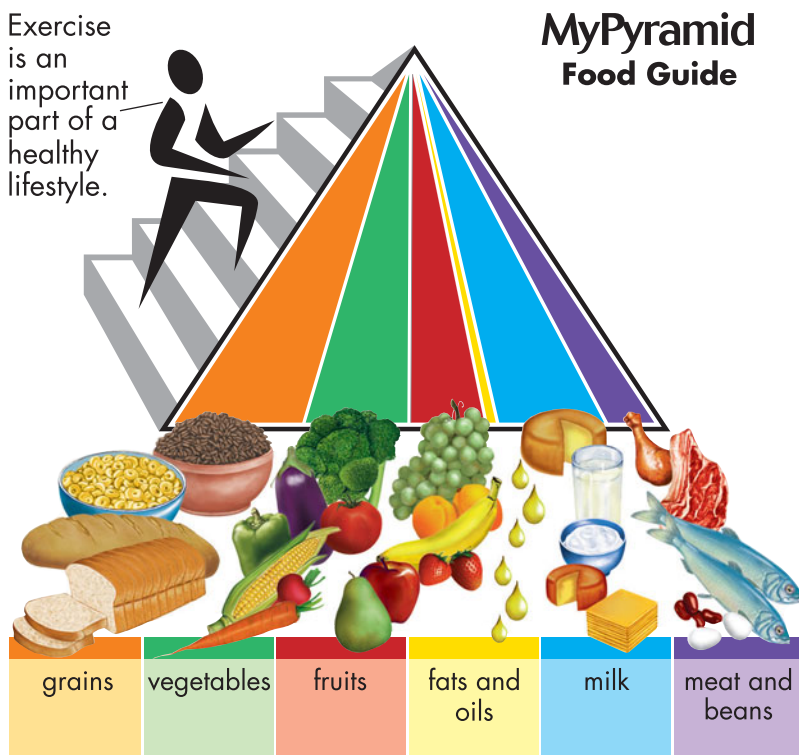

Minerals serve a variety of purposes. Calcium, for example, builds bones and teeth and helps to clot blood. Iron is needed to build red blood cells and

carry oxygen from the lungs to other body cells. Other minerals important to the human body include iodine, magnesium, sodium, potassium, and zinc.

The body also needs vitamins. Vitamin C keeps gums healthy and helps the body absorb iron. Vitamin D works with calcium and phosphorus to make strong bones and teeth. Other vitamins are A, E, K, and the B-complex vitamins.

Water is important in many chemical reactions in the body. In fact, every cell in the body must be bathed in water. Water also helps the body get rid of wastes and maintain its temperature. Water makes up about 60 percent of an adult's body weight.

Exercise is an important part of a healthy lifestyle.

Source: U.S. Department of Agriculture

People should try to eat several servings of grains, vegetables, fruits, dairy products, and meat or beans every day. They should eat only a small amount of fats and oils.

Food Pyramid

Different foods contain different nutrients. Some foods are better sources of nutrients than others are. Scientists have created a chart called the food pyramid to show how much of different groups of food a person should eat in order to be healthy. In general they recommend that people eat more grains, vegetables, fruits, and milk and fewer fats and oils.

Food Chain

The term food chain describes the order in which organisms, or living things, depend on each other for food. Every

A food chain in the ocean begins with tiny one-celled organisms called diatoms. They make their own food from sunlight. Shrimplike creatures eat the diatoms. Small fish then eat the shrimplike creatures, and bigger fish eat the small fish.

ecosystem, or community of living things, has a food chain. Some have more than one food chain.

Most food chains start with organisms that make their own food, such as plants. Scientists call them producers. Organisms that eat other living things are known as consumers. A squirrel that feeds on plants is called a primary consumer. A hawk that eats the squirrel and other primary consumers is called a secondary consumer.

Decomposers are often the final link in a food chain. Decomposers are bacteria and other organisms that cause decay. When plants and animals die, decomposers break down their tissues. This adds nutrients to the soil so that new

plants may grow. Then the food chain begins again.

A food web is a group of food chains within an ecosystem. Most living things eat more than one type of animal or plant. So their food chains overlap and connect. For example, the hawk that ate the squirrel also may eat fish. This makes the hawk a part of two food chains, or a food web.

Ecosystem • Living Thing

Food Poisoning

Food sometimes gets contaminated or infected with harmful things. A person who eats such food can get an illness

called food poisoning. Food poisoning is usually not serious, but some types are deadly.

Symptoms

The symptoms of food poisoning usually begin within hours of eating the contaminated food. The most common symptoms are fever, stomach cramps, nausea, vomiting, and diarrhea.

Causes

Certain microorganisms (tiny living things) cause most types of food poisoning. Bacteria and other microorganisms can infect eggs, meat, vegetables, and many other foods. After entering the body these microorganisms release poisons that make people sick.

Some chemicals can also cause food poisoning. These chemicals are often added to food while it is being grown, processed, or prepared. For example, many farmers spray chemicals on crops to kill weeds and insects. Some people may

have a bad reaction to those chemicals when they eat the crops.

Some plants and animals contain natural poisons that are harmful to people.

These include certain kinds of seafood, grains, nuts, seeds, beans, and fungi (mushrooms). Molds called mycotoxins may also cause food poisoning.

Prevention

When people handle food properly, the risk of food poisoning is very small. Microorganisms multiply rapidly in dirty places and in warm temperatures. This means that people should never touch food with dirty hands or put food on unwashed surfaces. Food should be refrigerated to stop microorganisms from growing. Meat needs to be cooked thoroughly to kill any dangerous microorganisms.

People should also wash food covered with chemicals before eating it. Finally, people should not eat wild mushrooms or other foods that grow in the wild. Some of these foods may contain natural substances that are poisonous to humans. In addition, some types of fish, such as the moray eel, and certain shellfish can be poisonous.

Treatment

Most people recover from food poisoning after a few days of resting and drinking extra fluids. People who cannot drink enough may need to have fluids pumped into their veins. If people eat natural poisons, they must go to the

Salmonella bacteria that cause illness are seen through a microscope.

hospital right away to have their stomachs emptied.

Bacteria • Food and Nutrition

Foot

All animals with a backbone and legs have a foot attached to the end of each leg. Feet are made up of bones, muscles, and connective tissue. At the front, feet are divided into digits, or toes. Hardened skin—in the form of claws, nails, or hooves—covers the ends of the digits.

While an animal is standing, its feet touch the ground and support its weight. The structure of feet also allows animals to walk, run, and jump.

Humans place their whole foot on the ground while walking. Dogs keep their heels off the ground.

The Human Foot

The human foot has a heel, a middle portion called an instep, and toes. The bottom of the foot is called the sole. The ball of the foot is the part of the sole behind the toes.

Each foot has 26 bones. The bones form two arches that allow humans to stand and walk upright. One arch extends from heel to toes. It absorbs the shock of walking. The other arch reaches across the ball of the foot. It helps to spread the weight of the body over the foot. The joints, or places where the bones meet, let the foot bend easily.

Feet of Other Animals

Some animals—including raccoons, monkeys, and apes—can use their feet to grasp things. But like other animals, they also use their feet to get around.

While walking, some animals, such as bears and baboons, put the whole foot on the ground. Others, including cats and dogs, never put their heels down. Still other animals, such as horses and deer, walk on their hooves, which are at the tip of one or two toes. Running on tiptoe allows these animals to move very quickly.

Mollusks, including snails and clams, have a muscle called a foot that allows them to move. What are called feet in insects are just the lower parts of their legs.

A podiatrist is a doctor who specializes in the care of human feet.

Football

A football player carries the ball while a player for the other team tries to stop him.

Millions of people in the United States consider autumn to be football season. Football is a very popular sport that is played on high school fields, college campuses, and in professional stadiums.

Football involves running, passing, kicking, and body contact. A football game is played between two teams of 11 players each. A team scores points by moving a ball across the other team's goal line. The team that scores more points wins.

This game is sometimes called American football. It is played mainly in the United States. Canadian football is very similar to the U.S. game. But in most countries around the world the word football refers to the sport also known as soccer.

Playing Field and Equipment

American football is played on a grassy, rectangular field. The field is 120 yards (110 meters) long and 160 feet (49 meters) wide. White lines called end lines and sidelines mark the edges of the field.

Each end of the field has a goal line. The goal lines are 100 yards (91 meters) apart. The 10-yard areas between the goal lines and the end lines are called the end zones. A pair of goalposts connected by a crossbar stands at the back of each end zone.

Most of the action in a football game takes place between the goal lines. White lines run across this part of the field every 5 yards (4.6 meters). These lines help to show how far a team has moved the football. Two sets of short lines, called hash marks, cross these lines. Officials use the hash marks to place the ball on the field after play is stopped.

Because football is a rough game, players wear equipment to protect themselves. They wear padding on their shoulders, hips, thighs, and knees. They also wear a mouth guard and a helmet with a face mask.

A football is an oval with pointed ends. It is filled with air and usually covered with leather.

Playing the Game

A football game begins with a kickoff. One team, called the kicking team, kicks the football to the other team, called the receiving team. A player on the receiving

team catches the ball. The player then runs toward the kicking team's goal line. The kicking team tries to stop him. Its players can tackle, or throw down, the ballcarrier. They can also push him out of the playing area. This is called being out of bounds.

The game continues from the spot where the ballcarrier was stopped. An official places the ball on the field. The teams line up facing each other on opposite sides of the ball. An imaginary line called the line of scrimmage runs through the football to each sideline. It separates the two teams.

A football team has some players who play offense and others who play defense. The two teams take turns playing offense and defense.

The team with the ball plays offense. It tries to move the ball down the field for a score. The offense can move the ball either by running with it or by throwing, or passing, it. The different types of running or throwing tactics that the offense uses are called plays. The offense designs plays to move forward by overpowering or fooling the defense. The

offensive player called the quarterback begins most plays. The quarterback usually hands or passes the ball to a teammate.

The defense tries to prevent the other team from scoring. Defensive players can tackle the quarterback or any other player who has the ball. They can also catch a pass that the quarterback meant to throw to a teammate. This is called an interception. The team that makes the interception then switches to offense.

The offense has four tries, called downs, to move the ball at least 10 yards. If the offense fails to do this, the other team gets the ball. If the offense does move the ball 10 yards or more, it gets another four downs. This continues until the offense scores, the defense takes away the ball, or time runs out.

The offense can score touchdowns or field goals. Running or passing the ball across the goal line scores a touchdown. A touchdown is worth six points. After a touchdown the scoring team has a chance to earn extra points. Kicking the ball between the goalposts is worth one point. Getting the ball into the end zone

Did You Know?

American football is also called gridiron football.

An American professional football field is almost the same as a college football field.

Did You Know?

Touch football and flag football are versions of football that are often played in U.S. elementary schools. They are not as rough as tackle football.

by running or passing earns two points. When the offense does not score a touchdown, it can score three points by kicking the ball between the goalposts. This is a field goal.

Sometimes the defense scores, too. If an offensive player drops the ball, a defensive player can pick it up and carry it for a touchdown. Also, a defensive player can run with the ball after intercepting a pass. The defense scores two points by trapping the offense in its own end zone. This is called a safety.

History

Football started in the late 1800s in the United States as a college sport. Princeton and Rutgers played the first college football game in 1869. This game was similar to soccer. In 1871 students at Harvard University invented their own game. It combined soccer and the English game called rugby. In 1876 representatives from Harvard, Princeton, Yale, and Columbia universities wrote a set of football rules based on rugby.

Walter Camp, a coach at Yale, helped to separate the game of American football from rugby. Camp introduced the 11-man team and the line of scrimmage. He also began the system of downs.

The first professional football game was played in 1895. In 1920 professional football teams formed the organization that would later be called the National Football League (NFL). In 1970 the rival American Football League became part of the NFL. Since 1967 the two best teams at the end of each season

have competed for the Super Bowl championship. This game is one of the most watched shows on television.

Force

A force is a push or a pull on an object. A force happens when two objects interact—that is, when one object does something to the other object. When the interaction stops, the force stops, too.

Contact Forces and Field Forces

There are two types of forces: contact forces and field forces. Contact forces happen when objects touch each other. For example, contact forces happen when a person kicks a ball or pulls a wagon. Other examples of contact forces are sandpaper rubbing on a piece of wood and wind blowing against a moving car.

Each side in a tug-of-war game uses force to try to pull down the other side.

Field forces happen when two objects interact without touching each other. Field forces can create a push or a pull even at a distance. Gravity is a field force. When an apple falls from a tree, the force of gravity pulls the apple toward the ground. Another field force is magnetism. Paper clips stick to a magnet because its magnetic force is pulling on the paper clips.

Measuring Force

Most scientists measure force using a unit called the newton. Newtons measure the force needed to accelerate, or speed up, objects. Force may also be measured in pounds.

Forces and the Laws of Motion

In the late 1600s, the English scientist Isaac Newton came up with three laws that deal with forces and motion. The first law says that the motion of an object will not change unless a force pushes or pulls it. The second law says that a force on an object will make the

object speed up in the same direction as the force. Also, a strong force will make the object speed up faster than a weak force on the same object. The third law says that whenever a force pushes on an object, the object pushes back with an equal and opposite force.

Ford, Gerald R.

Gerald Ford was the 38th president of the United States. He was not elected to office. President Richard M. Nixon appointed him vice president in 1973. Ford became president in 1974 after Nixon resigned over the scandal known as Watergate.

Early Life and Career

Originally named Leslie Lynch King, Jr., Gerald Ford was born on July 14, 1913, in Omaha, Nebraska. His parents

TIMELINE

Ford is born in Omaha, Nebraska.

July 14, 1913

Ford is elected to the U.S. House of Representatives.

1948

President Richard Nixon appoints Ford as his new vice president after Agnew resigns.

1973

August 8, 1974

Nixon resigns and Ford becomes president.

Ford pardons Nixon.

September 1974

Ford loses the presidential election to Jimmy Carter.

1976

Ford dies in California.

December 26, 2006

Gerald R. Ford

divorced soon after his birth. His mother, Dorothy Gardner King, moved to Grand Rapids, Michigan, and married Gerald Rudolph Ford. The elder Ford adopted the boy and gave him his name. The younger Ford attended the University of Michigan, where he was a star football player. In 1941 he earned a law degree from Yale University.

Ford joined the U.S. Navy in 1942 and served in World War II. After the war he returned to practicing law. In 1948 Ford married Elizabeth Anne Bloomer. They had four children.

Congress and Vice Presidency

A Republican, Ford was elected to the U.S. Congress in 1948. He served in the House of Representatives for 25 years. In 1973 Vice President Spiro T. Agnew resigned after being charged with not paying taxes and other crimes. President

Nixon named the popular and honest Ford as Agnew's replacement.

Presidency

After Nixon resigned in 1974, Ford was sworn in as president. Ford granted Nixon a full pardon for any crimes that he might have committed as president. The pardon angered many people. Many also opposed Ford's pardons of men who had avoided military service during the Vietnam War.

Ford tried to stop rising prices and unemployment, but he could do little to help the poor economy. Twice in September 1975 people tried to assassinate him. Secret Service agents stopped one shooter; the other shooter missed.

Defeat and Retirement

By the 1976 election many voters viewed Ford as a weak president. He lost to Democrat Jimmy Carter. In 1980 Ronald Reagan asked Ford to run as his vice president, but Ford chose to retire to private life. Ford died on December 26, 2006, in Rancho Mirage, California.

Forest

A large area filled with many trees is called a forest. Forests grow in almost every part of the world. The only places bare of forests are deserts, some prairies

Forests are home to many plants besides trees.

and mountaintops, and the North and South poles.

Types of Forest

Two basic types of tree make up most forests: hardwoods and softwoods. Many forests contain either hardwoods or softwoods, but some forests have both types.

Maples and oaks are examples of hardwood trees. Hardwoods have wide leaves and grow fruits. They are often deciduous, meaning they drop their leaves every fall. However, some hardwoods, such as mahogany trees, keep their leaves all year. Hardwood forests grow in places with temperate (mild) or tropical (hot) weather.

Pines and redwoods are examples of softwood trees. Softwoods have cones and needles rather than fruits and wide leaves. Softwoods do not lose their needles each year. Many softwoods are known as evergreens because their needles remain green year-round. Soft-

wood forests often grow near mountains and in cool regions.

Thick forests that grow in wet parts of the world are called rain forests. Rain forests may contain hardwoods, softwoods, or both.

Life in the Forest

Every forest is a complex living system made up of thickly growing trees, bushes, vines, fungi, and other plants. Forests are also the homes of mammals, birds, insects, and many other animals. These living things all depend on each other to survive.

As a forest ages or changes, it affects all the living things in it. Diseases or insect attacks may weaken its trees and plants. Fire can destroy the food and shelter that animals need to survive. Humans can also endanger forest plants and animals by chopping down too many trees. After a forest changes, it may have a new set of plants and animals.

Forest Products

Many important natural resources come from the world's forests. Forests provide food, wood, fuel, natural fibers, and other materials. These resources may be made into furniture, shelter, paper, clothing, medicines, and many other products.

To save natural forests people sometimes plant tree farms. As workers cut down the trees grown on these farms, they plant new trees to replace them.

Did You Know?

Tropical rain forests may have trees that are more than 150 feet (45 meters) tall.

A woman walks through a tropical forest in Seychelles, an island country in the Indian Ocean. Hiking is a popular activity in many forests.

Other Benefits of Forests

Forests are known as the lungs of the planet. This is because they supply a huge amount of Earth's oxygen, which animals need to breathe. The trees of a forest give off oxygen as part of a process called photosynthesis. Forest trees also help to protect soil from erosion. They block the forces of wind and water that wear away the land. In addition, forests offer a peaceful place for hiking, camping, bird-watching, and exploring nature.

Protecting Forests

For thousands of years people have been cutting down forests for wood and to make room for farms and cities. Now many of the world's forests are in danger of disappearing. Many people work to protect forests.

Forestry is the science of managing forests. People who work in forestry study the life cycles of trees and other forest plants. Foresters usually have a college degree in forest sciences. They work to prevent the spread of tree diseases, keep trees safe from harmful insects, and control forest fires. Many professional foresters work for the government.

To save forests many governments also create national forests, state parks, and wilderness preserves. In these places forests are left in their natural state for people to enjoy. Sequoia National Park in California was created in 1890 to protect groves of giant sequoia trees.

Fossil

Fossils are the remains or traces of plants and animals that lived long ago. Fossils give scientists clues about the past. For this reason, fossils are important to paleontology, or the study of prehistoric life.

Most fossils are found in earth that once lay underwater. They usually formed from the hard parts—such as shells or bones—of living things. After a living thing died, it sank to the bottom of the sea. Layers of earth and the remains of other living things built up on top of it. Over time, these layers turned into rock. Eventually, part or all of the living thing's hard parts also turned into rock. The fossil is the shape of these hard parts in the rock.

Other fossils are imprints on soft material that later hardened into rock. For example, scientists have found dinosaur footprints in rock that formed from mud. Many plants left leaf prints, too.

Another kind of fossil can form after a small insect or a piece of a plant gets trapped in resin. (Resin is a sticky substance made by pine and fir trees.) When the resin hardens into a rocklike material called amber, the object inside is preserved.

Fossil Fuel

All the machines of modern life require energy to make them run. About 90 percent of that energy comes from burning fossil fuels. Fossil fuels include petroleum (oil), coal, and natural gas. These materials are called fossil fuels because, like fossils, they are the remains of organisms that lived long ago. Organisms are plants, animals, and other living things.

How Fossil Fuels Formed

Fossil fuels formed in the ground hundreds of millions of years ago. Dead organisms sank into mud and rock. Over time many layers of rock built up. The remains of the organisms slowly changed in form to become different kinds of fossil fuels. Coal came from plants. Petroleum and natural gas came mainly from microscopic organisms such as algae.

Uses and Producers

Fossil fuels and their products have many uses. Power plants use fossil fuels to produce electricity. People heat their

Did You Know?

Fossil fuels contain an element (basic substance) called carbon. The burning of fossil fuels sends carbon into the air in the form of a gas called carbon dioxide.

A rock contains the fossilized skeleton of a mammal-like reptile. This animal lived more than 200 million years ago.

Coal is an important type of fossil fuel. It is buried underground and must be dug up.

homes and other buildings by burning fossil fuels. Gasoline, a product made from petroleum, fuels cars and other kinds of motorized equipment.

Many countries produce fossil fuels. The greatest producer of petroleum is Saudi Arabia. Russia has the largest reserves of natural gas. Major coal-producing countries include the United States and China. The United States uses more fossil fuels than any other country.

Disadvantages of Fossil Fuels

Since the late 1700s people have been using fossil fuels at a faster rate than ever before. But the planet's supply of fossil fuels is limited. Fossil fuels are called nonrenewable resources. Once they are used up, they will be gone forever.

The use of fossil fuels harms the environment as well. When petroleum and coal burn, they release harmful gases. These gases react with moisture to create acid rain, a dangerous form of pollution. Burning fossil fuels also increases the

temperature of Earth's atmosphere. This warming, called the greenhouse effect, may be harmful to living things.

For these reasons scientists and engineers have developed new ways to generate power without using fossil fuels. For example, some cars are now powered by electricity instead of gasoline. Homes can be heated by sunlight. Some electric power plants run on nuclear energy, water power, or wind power.

Fox

The Fox were a Native American tribe that traditionally lived in the western Great Lakes region. By the 1600s they had settled in what is now northeastern Wisconsin. Europeans called them the Fox, but they called themselves

Five Fox men pose in about 1890.

Mesquakie, meaning “Red-Earth People.”

During the spring and summer the Fox lived along river valleys in large houses made from poles and elm bark. They grew corn, beans, squash, and pumpkins and gathered wild nuts and berries for food. After the harvest the Fox left their villages to hunt bison (buffalo) on the prairies. They also hunted deer and other game. While on the hunt they lived in small, portable dome-shaped houses called wigwams.

During the 1600s traders from France and England began arriving in Fox territory. The French, with the help of the Ojibwa tribe, drove the Fox into what are now Illinois and Iowa. The United States later forced the Fox to give up their land. In the mid-1800s the tribe moved to what is now Oklahoma, where they shared a reservation with the Sauk. Americans called both groups the Sauk and Fox tribe. In 1857 some Sauk and Fox returned to Iowa, where they bought land. At the end of the 20th century there were more than 4,000 Sauk and Fox. Most lived in Kansas, Nebraska, Oklahoma, and Iowa.

Fox

Foxes are mammals that look like small, bushy-tailed dogs. They live all over the world. Different kinds favor different habitats. The red fox likes farmland. The gray fox lives in forests. The silver fox is

Long fur keeps a red fox warm in winter.

found in cold areas. The Arctic fox lives around the North Pole.

Foxes have pointed ears, short legs, and a narrow snout. They are about 32 to 57 inches (81 to 145 centimeters) long, including the tail. Foxes usually weigh 6 to 17 pounds (3 to 8 kilograms). They have long fur that varies in color. Red foxes are reddish brown. Silver foxes are black with gray-tipped hair. The Arctic fox is brownish in the summer and white in the winter.

Foxes usually live in dens. The den is often a burrow that another animal dug and left. Most foxes hide by day and hunt by night. Foxes will eat almost anything they can find. They like to eat birds, including chickens, and small mammals such as gophers and rabbits.

Foxes have few enemies except for humans. People hunt foxes for sport and for their fur. People also raise foxes on farms for their fur.

France

France is a large country in western Europe. France is known for its proud history and rich culture. The capital is Paris.

Geography

France shares borders with Belgium, Luxembourg, Germany, Switzerland, Italy, Spain, and Andorra. The Mediterranean Sea lies to the south, and the Atlantic Ocean lies to the west.

In the north and west the Seine and Loire rivers run through broad plains. In the southeast are the French Alps. France's highest point—Mont Blanc, which rises 15,771 feet (4,807 meters)—is in the Alps. In the southwest the Pyrenees Mountains lie between France and Spain.

The north of France has cool to cold winters, warm summers, and moderate rainfall. On the Mediterranean coast

Dinan is a town on the Rance River in the region of Brittany in western France.

winters are sunny, and it rarely rains in summer.

Plants and Animals

Forests cover about one fourth of the land. Pine, fir, ash, oak, beech, maple, chestnut, and olive trees are common. The country's wild animals and birds include foxes, beavers, wildcats, deer, wild pigs, hawks, and storks.

People

Most of the people are French. The French language is one of the world's most widely spoken languages. The population also includes small groups of North Africans and other Europeans. Some Basque people live in southern France. More than three fourths of the people are Roman Catholics. Other religious groups include Muslims, Protestants, and Jews.

Economy

France is one of the major economic powers of the world. Its economy is based on services, including tourism and banking. Manufacturing is also important. France produces machinery, cars, aircraft, medicines, food products, iron and steel, cosmetics, clothing, and other goods.

Though agriculture is a small part of the economy, France is a top producer of wheat, cattle, pigs, and chickens. It is also well known for its cheeses and wines.

History

People lived in what is now France more than 100,000 years ago. The Gauls, a Celtic people, migrated to the area in about 1200 BC. By about 50 BC the ancient Romans had conquered the region, which they called Gaul.

As the Roman Empire weakened, German tribes invaded Gaul. The Franks

were the strongest of those tribes, and they gave France its name. The greatest Frankish ruler was Charlemagne, who came to power in AD 768. By the early 800s Charlemagne's empire covered most of western Europe. When Charlemagne died, however, his empire was divided into three parts. After 843 the western section became known as the kingdom of France.

Wars over Land and Religion

In 1066 the French duke of Normandy conquered England. Because of that connection to France, English kings later claimed parts of France for themselves. This led to many battles between the two countries.

One particularly difficult period was the Hundred Years' War, which began in 1337. France was close to defeat when a peasant girl named Joan of Arc led the French army to victory. By the end of the war in 1453, the English had lost nearly all of their land in France.

TIMELINE

Ancient Rome conquers Gaul.		The Hundred Years' War with England begins.		Emperor Napoleon I is defeated.		France joins the European Union.
about 50 BC	AD 768	1337	1789	1815	1940	1993
Charlemagne becomes king of the Franks.		The French Revolution begins.		Germany invades France during World War II.		

During the 1500s Protestantism spread across Roman Catholic France. Wars broke out between Protestants (known as Huguenots) and Roman Catholics. Peace came in 1598 when King Henry IV signed the Edict of Nantes, which granted Protestants some rights.

French Revolution and Napoleon

During the 1600s France became the greatest power in Europe. Louis XIV, who reigned from 1643 to 1715, raised the power of the king to new heights. In the 1700s, however, France lost a series of costly foreign wars. At home, political disorder and public anger resulted in the French Revolution in 1789. This uprising by the French people led to the end of the French monarchy. After the revolution France became a republic.

Nice

After a period of weak government France fell into the hands of General Napoleon Bonaparte in 1799. He named himself emperor of France in 1804. Napoleon set out to conquer Europe. He was finally defeated in 1815. Afterward the monarchy was restored, but it fell in 1870. France once again became a republic.

World Wars

Germany invaded France in 1914, at the beginning of World War I. France and its allies narrowly defeated Germany during that war. Less than 30 years later, however, Germany again invaded France, during World War II. While occupied by Germany, France was led by a French government that worked with the Germans. But part of the French

Frank

The Franks were a group of people who lived in Europe more than a thousand years ago. The country of France was named after them. The Franks moved to the land that became France from a region that is now in Germany. They spoke a language that is related to German.

In ancient times the Romans ruled what is now France as part of the Roman Empire. The land was then called Gaul. The Roman Empire lost power in the AD 400s. Franks and other Germanic peoples moved into Gaul during this time.

King Clovis I was the first important Frankish king. He brought several groups of Franks together under his leadership. In the late 400s Clovis started to follow the religion of Christianity. His followers became Christians,

too, which helped to unite them as a people. By the early 500s Clovis ruled most of Gaul.

A later king named Charles became known as Charlemagne, which means Charles the Great. Charlemagne added to the lands ruled by the Franks. Charlemagne also spread Christianity. In 800 the pope (leader of the Christians in Rome) rewarded Charlemagne by giving him the title of emperor. Charlemagne's empire became known as the Holy Roman Empire.

Charlemagne's sons and grandsons were unable to hold the Frankish empire together after Charlemagne died. The Frankish lands in the east continued as the Holy Roman Empire. The Frankish lands in the west became France.

Frank, Anne

During World War II a young Jewish girl, Anne Frank, kept a diary for two years while hiding from the Nazis with her family. Anne and her family were victims of the Holocaust, which was Nazi Germany's campaign to destroy the Jews. From the diary, readers have found out what Jewish people experienced and felt during the time of the Holocaust.

Early Life

Anne Marie Frank was born on June 12, 1929, in Frankfurt, Germany. In 1933 Adolf Hitler's Nazi Party came to power,

Did You Know?

Anne Frank's diary shows remarkable hope in the face of fear and evil. She wrote, "In spite of everything I still believe that people are really good at heart."

Anne Frank

and Germany became a dangerous place for Jews. Anne's family soon moved to Amsterdam, The Netherlands.

In May 1940, during the early months of World War II, Germany took over The Netherlands. By 1942, Jews were being rounded up and sent to camps where most of them would die.

The Secret Annex

Anne's father prepared some rooms upstairs from his business offices. This was to be a "secret annex" where his family could hide. On July 6, 1942, the Frank family and four other people went into hiding. Some non-Jewish friends supplied them with food.

For two years the eight people shared the small space. They were always afraid, but they tried to live normally. Anne wrote in her diary about her daily life and her hopes.

After the Annex

Somehow the Gestapo (German secret police) found out about the annex. On August 4, 1944, they arrested everyone. Anne and her sister went to the Bergen-Belsen camp in Germany. In March 1945 they both died of a disease called typhus. Except for her father, everyone from the secret annex died in the camps.

After the raid, friends discovered Anne's diary. In 1947 Mr. Frank had it published. The English translation was titled *The Diary of a Young Girl*. The annex building in Amsterdam is now a museum called the Anne Frank House.

Frankfort

Population
(2000 census)
27,741

Frankfort is the capital of the U.S. state of Kentucky. The Kentucky River flows through the city.

Frankfort is a trade center for the area. Its farms produce tobacco and corn. Some farmers in Frankfort raise Thoroughbreds, a breed of horse used in horse racing. Factories in the city make bourbon whiskey, candy, furniture, and electronics.

The Kentucky Capitol in Frankfort is 210 feet (64 meters) high.

A U.S. general founded Frankfort in 1786. The city became the capital of Kentucky in 1792. The Capitol burned down twice in the 1800s. Both times the cities of Louisville and Lexington tried to take over as state capital. But Frankfort remained the capital of Kentucky. In 1937 floods greatly damaged the city.

Franklin, Benjamin

Benjamin Franklin won fame as a writer, a publisher, a scientist, and an inventor. He is best remembered, however, for his leadership in the American colonies and the early United States.

Printer and Inventor

Franklin was born in Boston, Massachusetts, on January 17, 1706. He left

school at age 10. At age 12 he went to work in his brother's printing shop.

In 1723 Franklin moved to Philadelphia, Pennsylvania. He worked there as a printer. His most popular publication was *Poor Richard's Almanack*. The almanac featured Franklin's witty sayings and verses. A famous one was "Early to bed and early to rise, makes a man healthy, wealthy, and wise."

Franklin started many public services in Philadelphia. They included a fire department, a hospital, an insurance company, and a library. A school he founded became the University of Pennsylvania.

Franklin was a great scientific thinker and inventor. He invented the Franklin stove, which was used to heat rooms, and a type of eyeglasses called bifocals. His experiments with electricity led to the invention of the lightning rod. That

Benjamin Franklin

metal rod is used to protect buildings from lightning.

Politician

Franklin became a respected political leader in the years leading up to the American Revolution. In 1765 the British Parliament passed the Stamp Act, a tax on printing in the colonies. The act angered the colonists. Franklin persuaded the British to withdraw it.

In 1775, as war with Great Britain grew closer, Franklin took part in the Second Continental Congress. There he helped write the Declaration of Independence. In 1776 he went to France to seek aid for the Revolution. In 1787 he signed the U.S. Constitution.

In his last years Franklin wrote his autobiography. He also worked to end slavery. He died in Philadelphia on April 17, 1790.

Frederick the Great

Frederick II ruled Prussia, a kingdom in what is now Germany, from 1740 to 1786. He was a great military leader who made Prussia a major power in Europe. Because of his military genius, he earned the title Frederick the Great.

Frederick was born on January 24, 1712, in the city of Berlin. His father

Frederick the Great

was Frederick William I, king of Prussia. Frederick's early life was unhappy. He liked music, art, and literature, but his father wanted him to become a soldier. The king criticized and beat him. At age 18 Frederick ran away, but he was caught. His father put him in prison as punishment.

Frederick became king of Prussia when his father died in 1740. As king he was called Frederick II. He spent the first half of his reign waging war. He took land from Austria and conquered other German lands. Later he added a large part of Poland to Prussia's territory.

Building a great army was always Frederick's most important goal. He used most of the kingdom's money to feed, equip, and pay his soldiers. But Frederick also encouraged industry, education, and culture. He wrote poetry and books on history and politics. He also composed

music. Frederick died near Berlin on August 17, 1786.

Freetown

Freetown is the capital of the West African country of Sierra Leone. The city lies on the coast of the Atlantic Ocean. It is Sierra Leone's main port and largest city.

The city is named Freetown because it began as a home for freed slaves. An Englishman named Granville Sharp founded Freetown in 1787. Sharp was an abolitionist, or a person who worked to end slavery. Africans who had been slaves in England began settling the new town. Freed and escaped African slaves from other parts of the world also moved there.

In the early 1800s Sierra Leone became a British colony. In the middle of the 1800s Freetown was the capital of all of Great Britain's colonies in West Africa. Sierra Leone became an independent country in 1961. Freetown became its capital.

Rebels fought the government of Sierra Leone from 1991 to 2002. Freetown was often the site of terrible violence.

Frémont, John Charles

John Charles Frémont was a U.S. explorer, soldier, and politician. He blazed many trails in the American West. He also played a key role in the early history of California.

Frémont was born on January 21, 1813, in Savannah, Georgia. He attended college in South Carolina. Then he became a surveyor. In that job he measured land in the wilderness.

In 1838 Frémont helped to survey the upper Mississippi and Missouri rivers. While in Missouri Frémont met Senator Thomas Hart Benton. With Benton's support, Frémont led expeditions to

John Charles Frémont

map much of the area between the Mississippi River valley and the Pacific Ocean. He explored the Oregon Trail in 1842. In 1843 he reached California.

In 1845 Frémont returned to California. California was then part of Mexico. American settlers were rebelling against Mexican rule. The United States went to war with Mexico around the same time. Frémont joined the Army and helped the Americans take control of California. Then he was governor for a time.

After California became a state in 1850, Frémont was elected one of its first senators. Later, from 1878 to 1883, Frémont was governor of Arizona Territory. He died on July 13, 1890.

French and Indian War

From 1754 to 1763 France and Great Britain fought each other in the French and Indian War. The war was part of a bigger war, called the Seven Years' War, in Europe. However, the French and Indian War took place in North America. Even though France got help from its Native American allies, Britain won the war. The victory gave Britain control over most of the colonies in North America.

Background

In the middle of the 1700s both Britain and France controlled land in North

The British general Edward Braddock was badly wounded in the fight for Fort Duquesne in 1755. He left the battlefield on a cart and died soon afterward.

America. Britain controlled the 13 colonies that later became the United States. France's lands were called New France. New France included large parts of what is now eastern Canada. It also covered much of the Great Lakes region and areas west of the Appalachian Mountains.

Both countries wanted the upper Ohio River valley, in what is now northeastern Ohio and western Pennsylvania. The French were trading with the Native Americans, while people from the British colonies were starting settlements. Both sides built forts in the area.

War

War began in 1754, when British colonial troops under George Washington tried to drive the French from what is now western Pennsylvania. They failed. British soldiers arrived in 1755. They lost a battle for Fort Duquesne, near what is now Pittsburgh.

The next few years of the war continued to be difficult for the British. The French had a better army, and the Native Americans knew how to fight in the woodlands.

By the end of 1757, however, the British had begun to gain ground. They had collected more money and better supplies than France. They also had become experts in wilderness fighting. By 1760 the British had captured all of New France. The war ended when Britain and France signed the Treaty of Paris on February 10, 1763.

French Guiana

A part of France lies on the northeastern coast of South America. French Guiana is an overseas department (a type of province) of France. Cayenne is its largest city and capital.

Geography

Suriname and Brazil border French Guiana. The Atlantic Ocean is to the north. About 10 miles (16 kilometers) off the coast is Devil's Island, once known for housing France's political prisoners and wartime spies. The land is mostly low-lying. The Tumac-Humac Mountains in the south rise to 2,300 feet (700 meters). The climate is hot and humid.

Plants and Animals

Tropical rain forests cover much of French Guiana. Animals of the region

Devil's Island was once known for the horrible treatment of prisoners there. Today the island is a popular tourist destination.

include tapirs, ocelots, sloths, great anteaters, armadillos, monkeys, and parrots.

People

Mulattoes, or people with both black and white ancestors, form the largest ethnic group in French Guiana. There are smaller groups of French, Haitians, Surinamese, Antilleans, Chinese, Brazilians, East Indians, and others. French is the official language, but different groups also speak their own languages. Most people are Roman Catholics. French Guiana has a small population for the amount of land it covers. Most residents live in urban areas along the coast.

Economy

French Guiana receives much of its income from a European rocket-launching base near the town of Kourou. Most people work for the government or in services, including health care, banking, and tourism. French Guiana also produces gold, shrimp, rice, meat, wood products, and rum.

History

The original inhabitants of French Guiana were Carib and Arawak Indians. French traders settled there in the 1600s. The French later brought African slaves to work on sugar plantations. By the mid-1800s France was sending prisoners to the territory. French Guiana became a department of France in 1946.

French Polynesia

French Polynesia is a group of about 130 islands in the southern Pacific Ocean. It lies between South America and Australia. French Polynesia is an overseas country of France. It mostly rules itself, but for some things it depends on the French government. The capital of French Polynesia is Papeete, on the island of Tahiti.

Geography

French Polynesia is part of the region called Oceania. Most of the islands are the

Volcanoes created Bora-Bora, an island in French Polynesia.

rugged tops of ancient volcanoes. Atolls make up the rest of the land. They are coral reefs surrounding a pool of water.

French Polynesia's climate is tropical. Sometimes the islands are hit by powerful storms called typhoons. Rain forests and coconut, breadfruit, and other fruit trees grow on the islands.

People

Most of the people of French Polynesia are Polynesian. They are descended from the people who first settled the islands. The rest of the population consists mostly of French and Chinese. Most of the people live in or around Papeete. They speak Polynesian languages or French. Most people are Christians.

Economy

Tourism is very important to French Polynesia's economy. Other industries include fishing and raising shrimp and oysters. Pearls, which are made by oysters, are a valuable export.

History

Polynesians might have settled on the islands as early as 200 BC. Europeans started arriving in the 1700s. France made Tahiti and some surrounding islands into a colony in 1880. In 1946 France made French Polynesia an overseas territory, which gave the islands some power to rule themselves. In 2004 France gave French Polynesia more independence and named it an overseas country.

French Revolution

There were many protests during the French Revolution. In 1789 a crowd marched to the royal palace in Versailles, France. They brought the royal family back to Paris (the French capital) to face the people's demands.

In 1789 the people of France began the French Revolution. The revolution brought down their king and made France a republic—a country ruled by the people. This republic did not last, but France never returned to its old, unequal form of society. The ideas of the French Revolution spread to many other countries.

Background

In the 1780s several groups in France were pushing for change in society. One of them was a new class of wealthy city people called the bourgeoisie. They wanted more power. Meanwhile, farm-

workers and other common people were tired of working hard for the nobles, or rich landowners. Many were angry about paying taxes that nobles did not have to pay. At the same time, French thinkers called philosophers called for new forms of society and government.

The French government was weak. It had spent too much money on costly wars. The most recent of its wars was the American Revolution, in which France had helped the colonists defeat the British. King Louis XVI and Queen Marie-Antoinette also spent a great deal of money on themselves while the rest of the country suffered.

Revolution Begins

To help him solve France's problems, Louis XVI called together the Estates-General in May 1789. The Estates-General was a group made up of representatives from the three classes, or estates, of French society: the church, the nobles, and the commoners. In June most of the commoners and some members of the other groups broke away from the Estates-General. They declared that they were now a National Assembly that represented the entire country.

On July 14 a crowd in Paris stormed an old prison called the Bastille. The crowd released the prisoners that the government had held there. This event is now considered the start of the French Revolution.

A New Government

Other regions in France followed the lead of Paris and formed revolutionary

governments. Peasants in many places burned the castles of the wealthy land-owners. After that some nobles willingly gave up their privileges.

In August 1789 the National Assembly approved the Declaration of the Rights of Man and of the Citizen. This important document stated that all people are born free and have equal rights. The National Assembly also made many changes that would affect all the French people. It said that peasants no longer had to farm nobles' land for no pay. The Assembly also took property away from the Roman Catholic church. Finally, it gave most male citizens the right to vote.

At first the National Assembly let the king remain on the throne. But in September 1792 France changed its form of government from a kingdom to a republic. In 1793 the revolutionaries put Louis and Marie-Antoinette to death.

Reign of Terror

The French republic had a new assembly called the National Convention. Soon an extreme group called the Jacobins took control of it. They feared that not enough people supported the revolution. They began a period called the Reign of Terror.

The Jacobins arrested more than 300,000 people for being against the revolution. They put at least 17,000 people to death. Many had their heads cut off by a new machine called the guillotine. Finally, in July 1794 other members of the Convention arrested the

Maximilien de Robespierre was a leader during the Reign of Terror. He was blamed for many of the killings that took place. In 1794 Robespierre was arrested and executed.

leaders of the Reign of Terror. They sent these leaders to the guillotine.

Rise of Napoleon

In 1795 a less extreme government called the Directory took power. However, the Directory did not provide strong leadership. In 1799 Napoleon Bonaparte, a successful young general, did away with the Directory. He made himself the leader of a new government called the Consulate.

Napoleon grew so powerful that in 1804 he declared himself Napoleon I, emperor of France. Emperors and kings then ruled France for most of the next 70 years. France finally became a republic for good in 1871.

Frog

Frogs are small animals that can jump very well. Frogs are similar to toads. However, a frog has smooth skin and long legs. A toad has rough skin and shorter legs.

Frogs are found throughout the world except in very cold places. They are most common in rain forests. Frogs are amphibians, meaning that they can live in water or on land. Most frogs spend most of their lives in water. Some live in underground holes or in trees.

A frog has smooth, moist skin and big, bulging eyes. Its hind legs are more than twice as long as its front ones. Most frogs have webbed back feet to help them leap and swim. Tree frogs have sticky disks on the tips of their fingers and toes. These disks help them climb slippery surfaces.

The red-eyed tree frog is a brightly colored frog that lives in rain forests of Central and South America.

The bullfrog is the largest North American frog. It can be 8 inches (20 centimeters) long.

Many frogs are tiny. They can be less than an inch (2.5 centimeters) long. The largest frogs are about a foot (30 centimeters) long. Most frogs are green, brown, gray, or yellow. Some are brightly colored.

A frog catches prey by flicking out its long, sticky tongue. Most frogs eat insects and worms. Some also eat other frogs, rodents, and reptiles.

Frogs have glands in their skin that make poison. But this poison does not protect them from snakes, birds, and other enemies. Instead, frogs most often protect themselves by blending in with their surroundings.

Frogs usually lay their eggs in water. Within a few weeks the eggs hatch into tadpoles. Tadpoles are fishlike creatures that breathe through gills instead of lungs. To become an adult frog, a tadpole loses its tail and develops lungs and limbs.

Fruit

Fruits are an important part of a healthy diet. They contain fiber as well as many minerals and vitamins.

A fruit is the part of a flowering plant that contains the seeds. The skin of a fruit may be thin, tough, or hard. Its insides are often sweet and juicy. But some fruits, including nuts, are dry. Fruits develop from a plant's flowers.

Some foods that people call vegetables are actually fruits. For example, cucumbers, squashes, and tomatoes are all fruits. They contain seeds, while true vegetables do not. True vegetables are the stems, leaves, or roots of plants.

There are two main types of fruit: fleshy fruits and dry fruits. In fleshy fruits, the part of the fruit around the seeds is juicy and soft. Apples, berries, oranges, and other fleshy fruits contain many seeds. Some fleshy fruits—for example, cherries and peaches—contain only one seed, or pit. These are called stone fruits. Dry fruits are not as juicy as fleshy fruits. Dry fruits include beans and nuts.

People and many wild animals eat fresh fruits. Fruits are important sources of fiber and vitamins, especially vitamin C. They contain minerals and a large amount of water.

People also eat frozen, canned, and dried fruits. They make fruits into jams and jellies. They add fruits to a variety of desserts and main dishes. People also drink the juice of fruits.

Fuchsia

Fuchsias are flowering plants. They are known for their brightly colored, hanging flowers. Many people grow fuchsias in gardens and window boxes. Hummingbirds also like fuchsias.

Fuchsias can be found in Central America, South America, Europe, and

Fuchsia plants are prized for their drooping flowers.

the United States. They grow best in sheltered areas. Fuchsias need to be kept away from strong winds. They also need to be protected from heat.

There are about 100 species, or kinds, of fuchsia. They can be small plants, shrubs, or trees. Fuchsia flowers can be many colors, including white, red, pink, and purple. The color fuchsia, a bright reddish purple, got its name from these plants. Fuchsias also come in many sizes. Some are 6 inches (15 centimeters) tall. Others grow to 18 feet (5.5 meters).

The main part of a fuchsia flower is shaped like a tube or a bell. At the end are four brightly colored petals. The colors attract hummingbirds and insects. These animals drink the flowers' nectar, which is a sweet liquid. When they do this, pollen sticks to their bodies. The animals then carry the pollen to other flowers. This is how fuchsias reproduce, or create new plants.

Fugitive Slave Acts

In the United States before the American Civil War many people in the Southern states owned slaves. The Northern states did not allow slavery.

A notice warned African Americans in Boston, Massachusetts, a city in the North, about the Fugitive Slave Act of 1850.

Slaves therefore often tried to escape from the South to the North. To stop this, Congress passed two laws called the Fugitive Slave Acts, in 1793 and 1850. The laws stated that escaped, or fugitive, slaves must be returned to their owners. These laws applied even if an escaped slave was captured in a free state (state with no slavery). The second act was so harsh that it became a major problem between the North and the South.

Fugitive Slave Act of 1793

The U.S. Constitution of 1789 stated that escaped slaves had to be returned to their owners. Congress passed the Fugitive Slave Act of 1793 to enforce this part of the Constitution. The act allowed any slaveholder to capture a suspected runaway slave and bring the slave before a judge. The judge alone then decided whether the slave was a runaway.

The act angered abolitionists, or people who opposed slavery. Northern states voted to give some legal rights to escaped slaves. Abolitionists formed a secret network called the Underground Railroad to help slaves escape.

Fugitive Slave Act of 1850

Southern states soon demanded stronger laws to protect slavery. In 1850 Congress passed the second Fugitive Slave Act. The new act set severe penalties for anyone who helped a slave to escape.

The main effect of this act was to strengthen the abolitionist movement. Eventually the disagreement over slavery led to the American Civil War. During the war, the government sometimes enforced the Fugitive Slave Acts. In 1864 Congress finally did away with the acts.

Fuji, Mount

The highest mountain in Japan is Mount Fuji, or Fujiyama. It rises to a

Mount Fuji is considered the sacred symbol of Japan.

height of 12,388 feet (3,776 meters). A volcano, Mount Fuji last erupted in 1707. It lies near the Pacific Ocean on the island of Honshu. Tokyo, Japan's capital, lies 60 miles (100 kilometers) to the east.

Many Japanese consider Mount Fuji to be sacred. Its name means “everlasting life.” Temples and shrines surround the mountain. The Sengen (Asama) Shrine, at the western foot, has been the main shrine for worship of Mount Fuji since the 800s. The city of Fujinomiya has developed around the shrine.

Climbing Mount Fuji has long been a religious practice. Today huge crowds flock there, mostly during the climbing season from July 1 to August 26. Cities such as Fuji and Gotemba, at the foot of the mountain, serve as bases for thousands of climbers.

Funafuti Atoll

Funafuti Atoll is a group of about 30 small islands in the Pacific Ocean. They are part of the country of Tuvalu. The capital of Tuvalu, named Vaiaku, is on one of the islands in Funafuti Atoll. The islands are made of coral. They form a ring around a pool of water.

About half the people of Tuvalu live on Funafuti Atoll. Most of them make a living by fishing and farming.

Great Britain took over all the islands of Tuvalu in 1892. The United States built military bases on Funafuti Atoll in 1943, during World War II. Tuvalu became an independent country in 1978. Vaiaku became its center of government.

Fungus

A fungus is a simple organism, or living thing, that is neither a plant nor an animal. When there is more than one fun-

gus they are called fungi. Some familiar fungi are mushrooms, molds, mildews, truffles, and yeasts.

Fungi are found all over the world. They grow especially well in mild, moist regions and in the tropics. Fungi can be found in the water, soil, and air. Some live on or inside plants and animals.

A fungus is usually a mass of threadlike strands. A fungus usually reproduces by forming tiny cells called spores. Some fungi have a special part that makes spores. This is usually the part of a fungus that can be seen. For example, a mushroom is the spore-producing part of a fungus that is mostly underground. Wind, water, and insects carry spores away from the fungus that made them. If a spore lands in a damp place, it can grow into a new fungus.

A fungus grows by feeding on other organisms. Most fungi feed on dead plant and animal material. They are called saprophytes. These fungi help the environment by breaking down fallen trees, animal droppings, and other dead matter. But saprophytes can also ruin foods such as bread, cheese, and fruits and vegetables. Some saprophytes destroy timber, textiles, paper, and leather. Other fungi get their food from living plants and animals. These fungi are called parasites. Parasitic fungi often sicken or kill the organisms they attack.

Some fungi are useful. Many mushrooms and truffles can be eaten. Some yeasts are used to bake bread. In addition, penicillin and many other drugs

Fur Trade

Native Americans traded furs for supplies at places called trading posts.

The fur trade was a booming business in North America from the 1500s through the 1800s. When Europeans first settled in North America, they traded with Native Americans. The Native Americans often gave the settlers animal furs in exchange for weapons, metal goods, and other supplies. The settlers then sold many of the furs back to Europe. There, wealthy people had a high demand for furs. They used beaver, fox, mink, and other types of fur for hats and clothing. Eventually several fur-trading companies in North America grew rich by selling furs to Europe.

Two important figures in the early history of fur trading were Pierre Esprit de Radisson and Médart Chouart, sieur de Groseilliers. These two Frenchmen become successful fur traders in the middle of the 1600s. This brought them to the attention of King Charles II of England. In 1670 King Charles set up the Hudson's Bay Company to trade for fur in what is now Canada. He put Radisson and Groseilliers in charge of the company.

Over the next 150 years the successful Hudson's Bay Company faced many competitors. One of these was the North West Company, set up by French adventurers in 1783. In 1808 a German American businessman named John Jacob Astor opened the American Fur Company. Sometimes the companies traded with Native Americans for furs. Sometimes they bought furs from white men, called trappers.

Their search for furs led trappers to explore large areas of the continent. Because of their knowledge of the land they were able to serve as guides for later settlers.

North American fur-trading companies supplied many furs into the 1900s. But since then, furs have become much less popular. Today many people think that killing animals for their fur is wrong.

Gabon

The small nation of Gabon is one of the richest countries in Africa, thanks to its large petroleum (oil) deposits. Gabon's capital and largest city is Libreville.

Geography

Gabon lies along the equator on Africa's west coast. It is bordered by Equatorial Guinea, Cameroon, the Republic of the Congo, and the Atlantic Ocean. A low-lying plain along the coast rises to plateaus and mountains in the interior. The Ogooué River flows through the center of Gabon. The weather is hot and humid.

Plants and Animals

Dense rain forests cover much of Gabon. Its wild animals include antelope, monkeys, gorillas, and elephants.

People

There are more than 40 ethnic groups in Gabon. The Fang people form the largest group. Small groups of Pygmies live

Gabon has created a number of parks and reserves to protect its rain forests.

in the rain forests. The people of Gabon speak many different Bantu languages, but French is the official language. The majority of the population is Christian.

Economy

Gabon's economy is based on its natural resources, especially petroleum. Gabon also produces wood products and the metal manganese. Most farmers grow enough to feed only their families. Crops include plantains and sugarcane.

History

Pygmies and Bantu-speaking peoples lived in Gabon when Portuguese explorers arrived in 1472. The Portuguese and other Europeans used the coast for the slave trade. In 1849 France established Libreville (meaning "free town") as a settlement for freed slaves. In 1886 Gabon became a French colony. Gabon gained independence in 1960.

Gadsden Purchase

In 1853 the United States bought a large piece of land from Mexico. That sale is known as the Gadsden Purchase. It moved the border between the two countries south, to where it lies today. The Gadsden Purchase is named for James Gadsden, a U.S. businessman who helped to bring about the purchase.

Background

At the end of the Mexican War in 1848, the United States took more than 525,000 square miles (1,360,000 square kilometers) of land from Mexico. That land later became the states of California, Colorado, Nevada, Texas, and Utah. The land also included the northern parts of what are now Arizona and New Mexico.

At that time, James Gadsden was president of the South Carolina Railroad Company. He wanted to create the first transcontinental railroad—a railroad across the entire continent. He believed the best route for this new railroad was through part of northern Mexico. U.S. president Franklin Pierce agreed with Gadsden's idea. Pierce sent Gadsden to Mexico to buy land for the railroad.

Did You Know?

Completed in 1869, the first trans-continental railroad went through the Rocky Mountains, not across the land Gadsden had purchased.

A worker's hands sort rough diamonds in Gaborone, Botswana. Diamonds are Botswana's most valuable product.

The United States issued a postage stamp 100 years after the Gadsden Purchase. The stamp honored the pioneers who settled on the land that was purchased from Mexico.

The Purchase

Gadsden met with Mexico's president, Antonio López de Santa Anna, in 1853. Mexico badly needed money, so Santa Anna agreed to sell the land that Gadsden wanted. The United States paid 10 million dollars for almost 30,000 square miles (78,000 square kilometers) of land. The land would become the southern parts of Arizona and New Mexico.

Galápagos Islands

The Galápagos Islands are famous because of the scientist Charles Darwin. After studying the plants and animals on the islands in the 1800s, Darwin developed his theory of evolution. The theory explains how living things change over time. It changed the science of biology forever. Darwin was not the first person

to see the Galápagos Islands, but they were not a common destination before his visit. They are so far from other land that they are sometimes called “world’s end.”

The Galápagos consist of 13 major islands, 6 smaller islands, and many very small islands called islets. They lie along the equator in the eastern Pacific Ocean, 600 miles (1,000 kilometers) west of Ecuador.

The Galápagos were formed by volcanoes. Some of the volcanoes are still active. The landscape includes many mountains, craters, and cliffs. The islands receive little rainfall, and temperatures are fairly low.

Because the Galápagos are so isolated, the plants and animals found there are very unusual. Cactus forests grow in the dry lowlands, while the uplands are covered with thick, moist vegetation, such as ferns and mosses. Giant tortoises were once so abundant that Spanish explorers named the islands for them. The Spanish word *galápagos* means “tortoise.” The islands also have rare marine iguanas.

Isabela Island is the largest of the Galápagos Islands. Giant tortoises can be found there.

The Galápagos Islands belong to Ecuador, and most of the people living there are Ecuadorans. They live on the larger islands. Many of the islands have no people. The island of Baltra has a military base. Tourism, fishing, and agriculture are the main parts of the economy.

Galaxy

A galaxy is a group of stars, clouds of gas, and dust particles that move together through the universe. There are billions of galaxies in the universe. They probably formed billions of years ago, soon after the universe began.

The sun, Earth, and the other planets of the solar system are part of the Milky Way galaxy. Most galaxies move through the universe as part of clusters, or groups, of galaxies. The Milky Way is at one end of a cluster called the Local Group. It includes about 40 galaxies.

Size

Even the smaller galaxies are made up of millions of stars. These galaxies may be 5,000 light-years across. (A light-year is the distance light travels in a year—about 5.8 trillion miles, or 9.5 trillion kilometers.) The Milky Way is roughly 20 times larger than that. It includes hundreds of billions of stars. The largest galaxies are even more huge and contain trillions of stars.

Shape

Galaxies are divided into three main categories based on their shape: spiral, elliptical, and irregular. Spiral galaxies look like pinwheels. They have a central disk and two or more curved arms winding outward. The disk consists mainly of older stars, while the arms have younger stars. The arms contain much dust and gas, from which new stars can form. The Milky Way is a spiral galaxy.

An elliptical galaxy may be shaped like a round ball or may be more stretched out, like an American football. It has more stars near its center and fewer stars

The Whirlpool Galaxy is a large spiral galaxy. To the right is a smaller galaxy.

in its outer regions. Elliptical galaxies vary widely in size. Small elliptical galaxies are the most common kind of galaxy in the universe.

Unusually shaped galaxies are called irregular galaxies. They are not very common. Many of them have no obvious center point. Some of them appear to be the result of a crash between several galaxies.

Milky Way • Star • Universe

Galileo

Galileo has been called the founder of modern science. He was one of the first people to examine the heavens with a telescope. He also made breakthrough discoveries in the study of motion.

Galileo Galilei, who is generally known by his first name, was born in Pisa, Italy, on February 15, 1564. He entered the University of Pisa to study medicine but later switched to mathematics.

Galileo

Early Work

Galileo was interested in studying the effect of forces on the motion of bodies. In the Cathedral of Pisa he observed a chandelier swaying back and forth. He realized that it took the same time for each swing, whether the swings were large or small. This discovery became known as the law of the pendulum. It led to the use of the pendulum to keep track of time.

Use of the Telescope

In about 1609 Galileo learned of the invention of the telescope in the Netherlands. He later built his own version. The telescope allowed Galileo to make discoveries about space. On January 7, 1610, he discovered four moons revolving around the planet Jupiter. In his honor, these bodies are known as the Galilean satellites.

Discoveries Galileo made provided evidence that the sun is the center of the solar system. Nicolaus Copernicus, another famous astronomer, had put forth this theory in 1530.

Punishment and Death

Galileo's studies brought him into conflict with the Roman Catholic church. The church still taught that Earth was the center of the universe. Galileo was ordered not to teach or defend the ideas of Copernicus. He continued to do so, however.

In 1633 Galileo was brought before the Inquisition, a Roman Catholic institution that held power then. He was pun-

ished by being told he could not leave his house.

Galileo became blind in 1637 but continued to work. He died on January 8, 1642.

Gama, Vasco da

Vasco da Gama

The Portuguese navigator Vasco da Gama made three sea voyages to India between 1497 and 1524. His voyages opened a sea route from Western Europe to the East and made Portugal a world power.

Early Life

Little is known about Vasco da Gama's early life. He was born in the Alentejo province in southwestern Portugal in about 1460. His father, Estêvão da Gama, was the commander of a fortress there. Vasco's studies probably included mathematics and navigation.

Voyages

In 1495 the Portuguese king asked da Gama to lead an expedition eastward to India. In da Gama's time, Europeans wanted many goods from the East, particularly spices. Muslim traders controlled the land routes to the East. The Portuguese and Spanish monarchs knew that if they could control another trade route to the East, they would gain great wealth and power. They were eager to find a sea route to India. Another Portuguese explorer, Bartolomeu Dias, had earlier discovered that there was a passage around the bottom of Africa called the Cape of Good Hope. But he had not made it to India.

Da Gama made three voyages to India. On the first voyage, from 1497 to 1499, he and his fleet reached Calicut, an important trading center in southern India. However, da Gama was unable to make a trade agreement with the ruler of the city. Da Gama returned to Portugal with samples of spices and precious stones.

On his second trip, in 1502–03, da Gama returned to Calicut but also went on to Cochin, where he made an agreement with the ruler of that city. In 1524 da Gama was sent back to India as the Portuguese viceroy, or governor. His task was to improve the administration of the Portuguese colony at Goa, on the west coast of India. Da Gama reached Goa in September 1524. He soon fell ill, possibly because of overwork. Da Gama died in Cochin on December 24, 1524.

Did You Know?

On his first trip to India, da Gama offended Calicut's ruler by offering him trade goods of poor quality.

Gambia, The

The Gambia is the smallest self-governing country in Africa. It is located on the continent's west coast. The capital is Banjul.

Geography

The Gambia is a narrow strip of land. It is 295 miles (475 kilometers) long but only 15 to 30 miles (24 to 48 kilometers) wide. Except for a short coastline on the Atlantic Ocean, The Gambia is surrounded by Senegal. The Gambia River flows westward through the country into the Atlantic. The Gambia has warm weather and a long dry season.

Plants and Animals

Savanna, or grassland with scattered trees, covers most of the country. Mangroves, oil palms, cedars, mahogany trees, and rubber vines grow near the river. The Gambia is home to leopards, wild boars, monkeys, antelope, crocodiles, and hippopotamuses.

People

The Malinke (or Mandingo) people make up more than one third of the population. The Fulani, the Wolof, the Diola, and the Soninke are other important ethnic groups. The official language is English, but Wolof and Mandingo are widely spoken. Nearly all the people are Muslims. Most people live in rural areas.

Economy

The majority of Gambians are farmers who grow food for themselves. Crops

include millet, peanuts, rice, corn, sorghum, and vegetables. The Gambia's most important export is peanuts. Tourism and shipping also contribute greatly to the economy.

History

The Malinke and the Wolof developed kingdoms in the region before the Portuguese arrived in the mid-1400s. Great Britain took control in the late 1700s. The region was a major source of slaves until the early 1800s.

The Gambia gained independence in 1965. From 1982 to 1989 The Gambia and Senegal were united as the confederation of Senegambia. In 1994 the military overthrew The Gambia's government, but presidential elections resumed two years later.

Gandhi, Indira

As a child Indira Gandhi had an interest in politics. These early years foretold her future. As an adult Gandhi became the prime minister, or leader, of India.

Early Life

Indira Nehru was born on November 19, 1917, in Allahabad, India. At that time Great Britain ruled India. Many Indians disliked this rule by outsiders and fought against it. They created a political party called the Indian National Congress.

Children also joined the fight for independence. They formed their own organization: the Monkey Brigade. At only 12 years old Indira became the leader of the Monkey Brigade. As she grew up Indira stayed active in politics. She joined the Indian National Congress. She married Feroze Gandhi, a journalist, in 1942.

Indira Gandhi addresses a crowd in Delhi, India, in 1971.

Career

In 1947 India won independence from Great Britain. Indira Gandhi's father, Jawaharlal Nehru, became prime minister. Gandhi worked closely with her father. She became president of the Indian National Congress in 1959.

In 1967 Gandhi was elected prime minister of India. She served until 1977, when she lost a national election. But in 1980 she became prime minister again.

By that time some followers of the Sikh religion had begun to fight for complete independence from the Indian government. Gandhi considered these Sikhs terrorists. In June 1984 she ordered an attack on the Golden Temple, the Sikhs' holiest place. More than 450 Sikhs died.

On October 31, 1984, two Sikhs got revenge. While working as Gandhi's bodyguards, the Sikhs assassinated Gandhi in her garden.

Gandhi, Mahatma

Mohandas Gandhi was a leader of India's independence movement. When India was a colony of Great Britain, Gandhi used nonviolent methods to protest against British rule. His efforts earned him the title Mahatma. Mahatma means "great soul."

Did You Know?

Before becoming prime minister, Gandhi served as the minister of information and broadcasting, an important job in Indian government.

Mahatma Gandhi shares a laugh with his granddaughters.

Early Life

Mohandas Karamchand Gandhi was born on October 2, 1869, in Porbandar, India. In his youth he learned the religions of Hinduism and Jainism. Non-violence is one of Jainism's main ideas.

Politics in South Africa

In 1893 Gandhi took a job in South Africa. At the time it was also a British colony. There he saw Europeans mistreating Indian settlers. He got into politics to fight for Indian rights.

Gandhi first used his method of nonviolent protest in 1906. He told Indians that they should not obey the British laws that they thought were wrong. He also said they should stay peaceful no matter how they were punished for their actions.

Protests in India

Gandhi returned to India in 1915. Within a few years he became India's most powerful political leader. He led several major protests against the British. He was sometimes jailed for his actions.

Independence

India won its independence in 1947. It was a great victory for Gandhi. But he was disappointed because Hindus and Muslims fought each other. He tried to make peace. On January 30, 1948, in the city of Delhi, Gandhi was shot and killed by a Hindu man.

India

Ganges River

Followers of Hinduism believe that dying on the banks of the Ganges River and having one's ashes cast on its waters is the way to a happy afterlife. One of the world's great rivers, the Ganges flows across the plains of northern India for most of its course. In India the river is called the Ganga.

The Ganges is 1,560 miles (2,510 kilometers) long. It begins in the southern Himalayas, near India's border with the Chinese region of Tibet. After emerging from the mountains, the river flows onto the plains. Midway in its course, the

Ganges merges with the Yamuna River. It then flows into Bangladesh, where it is joined by the mighty Brahmaputra River. The combined stream empties into the Bay of Bengal.

Hindus make religious pilgrimages to many places along the Ganges. They believe that bathing in its waters washes away sin. Hindus also have built many temples for cremating, or burning, the dead along the Ganges. They scatter the ashes on the river, believing that the dead will go straight to heaven.

Water from the Ganges has been used for irrigation for more than 2,000 years. Rice and other crops grown in the Ganges region feed most of India and Bangladesh.

Garden

People have been growing plants in special areas of land, called gardens, since ancient times. Early gardens led to the many different kinds of gardens that people enjoy today.

Types of Gardens

The first gardens had useful purposes. They provided food and herbs. Herbs are plants that are used as medicines or for adding flavor to food. Vegetable and herb gardens remain popular today for the same reasons.

A mother and a daughter work in their garden.

People grow flower gardens, such as rose gardens, for their beauty. Cottage gardens are a well-known kind of flower garden, especially in England. They have showy flowers bunched tightly together. An indoor garden is called a conservatory. Gardens can be large areas set aside by a city or they can be a small plot in a backyard.

Botanical gardens are large gardens that are usually open to the public. Botanists,

A path of purple flowers blooms between rows of trees at Keukenhof Gardens near Amsterdam, The Netherlands.

Did You Know?

Tulips became so popular in Europe in the 1600s that the price of some bulbs rose to thousands of dollars each.

or scientists who study plants, help to grow botanical gardens. These gardens are organized in a scientific way. Groups of plants from similar climates grow in different sections of a botanical garden.

History

People began growing plants about 10,000 years ago. This was the earliest form of agriculture, or growing plants for food and other uses. People in ancient China, Egypt, and the Middle East later grew gardens for their beauty. In the 1600s the Dutch sold many tulip bulbs to Europeans who wanted to grow the flowers in their gardens. Today's gardens may contain plants from almost anywhere in the world.

Garfield, James A.

James A. Garfield, the 20th president of the United States, held office for less than a year. Garfield was shot four months after taking office and died slightly more than two months later, in September 1881.

Early Life and Career

James Abram Garfield was born in a log cabin near Orange, Ohio, on November 19, 1831. He grew up on his family's farm. Garfield graduated from Williams College in Massachusetts in 1856. In 1858 Garfield married Lucretia Rudolph. They had seven children.

James A. Garfield

Military and Political Career

After studying law and becoming a minister, Garfield turned to politics. He joined the Republican Party and was elected to the Ohio legislature in 1859.

When the American Civil War started in 1861, Garfield fought in several battles for the North. In 1862 Ohio elected Garfield to the U.S. House of Representatives. Serving until 1880, Garfield supported strict policies toward the defeated South. In 1880 the Ohio legislature elected him to the U.S. Senate. That year Republicans chose Garfield to run for president. He defeated General Winfield Scott Hancock, another Civil War veteran.

Presidency

President Garfield soon angered the conservative Republicans known as the Stalwarts. The leader of the Stalwarts, Senator Roscoe Conkling, gave out gov-

TIMELINE

Garfield is born near Orange, Ohio.

November 19, 1831

Garfield is elected to the U.S. House of Representatives.

1862

Garfield fights for the North in the American Civil War.

1861–63

Senator Roscoe Conkling resigns.

May 1881

Garfield is elected president.

1880

Garfield dies.

September 19, 1881

Garfield is shot in the back.

July 2, 1881

ernment jobs as rewards. Garfield wanted more control over that process. When he gave a job to one of Conkling's enemies, Conkling resigned from the Senate. Garfield's actions strengthened the power of the presidency.

A Stalwart supporter, Charles J. Guiteau, became angry when Garfield refused to give him a job. On July 2, 1881, Guiteau shot Garfield in the back at a railroad station in Washington, D.C. The president lay ill for 80 days before dying on September 19, 1881, in New Jersey. Vice President Chester A. Arthur became president the next day.

Did You Know?

Carvings of strange creatures that are not waterspouts are called grotesques, not gargoyles.

the gargoyle's open mouth and onto the streets below. Today people often call any stone carving of a strange creature a gargoyle. However, if such carvings are not waterspouts they are not technically gargoyles.

Gargoyles have been used for more than 2,000 years. They were most popular in parts of Europe during the later Middle Ages, from about AD 1000 to 1500. During that time the largest and most important building in any town was the church or cathedral. Those buildings were costly to build. Rainwater running down the walls would eventually ruin the building. Therefore, workers carved decorative statues to act as waterspouts. At the end of the Middle Ages people began using lead drainpipes, so true gargoyles became less common.

Garlic

Garlic is a plant that is closely related to the onion. Its bulbs are a very popular cooking ingredient. The garlic plant belongs to the lily family. Its scientific name is *Allium sativum*.

Garlic first grew in central Asia. Today it also grows wild in Italy and southern France. In the United States garlic is grown mostly in California.

There are dozens of varieties of the garlic plant. The top of the stalk usually produces flowers and bulblets, or tiny bulbs. The useful garlic bulbs are in the soil.

The useful part of a garlic plant is the bulb that grows underground.

Each bulb contains up to 20 sections, called cloves. The cloves are covered by a thin, papery skin. The garlic plant does not produce seeds. New plants grow from planted bulblets or cloves.

Garlic has a powerful, onionlike smell and a strong taste. Peeled cloves may be chopped up or crushed to flavor sauces, stews, and salad dressings. Since ancient times garlic has also been used in medicine. In addition, people once carried garlic as a charm to keep away vampires and other supposed evils.

Garvey, Marcus

Marcus Garvey was a black leader of the early 1900s. He encouraged blacks to be proud of their African heritage. His goal was to start a new black country in

Africa. Garvey had so many followers that he was known as the Black Moses.

Marcus Moziah Garvey was born on August 17, 1887, in Saint Ann's Bay, Jamaica. As a young man he worked to improve conditions for black workers in Jamaica and elsewhere. In 1912 he moved to London, England. There he met blacks from many countries. He became very interested in African history and culture.

Garvey returned to Jamaica in 1914. He founded a group known as the Universal Negro Improvement Association (UNIA). In 1916 Garvey went to the United States to start UNIA offices there.

Garvey taught that blacks would be respected only when they were successful in business. He started a newspaper and several companies. He also promised to create a black-governed country in

Marcus Garvey was named Jamaica's first national hero in 1964.

Africa. At that time European countries ruled nearly all of Africa as colonies.

In the early 1920s Garvey was found guilty of fraud (cheating people out of money). He lost many of his supporters and spent two years in jail. After being released in 1927, Garvey was forced to leave the United States. Garvey died in London on June 10, 1940.

Gas, Natural

Many stoves and home furnaces burn a fuel called natural gas. Natural gas is really a mixture of several different gases that formed slowly beneath Earth's surface.

How Natural Gas Formed

Natural gas often formed along with petroleum (oil) hundreds of millions of years ago. As plants and tiny animals died, their remains built up in many layers. Underground pressure and heat gradually changed the remains into gas and petroleum.

Types of Gas

The gases that make up natural gas include methane, ethane, propane, butane, and other substances. Because these gases burn very easily, they are valuable as fuels.

Gas may also be made from coal and petroleum. This type of gas is called manufactured gas.

Did You Know?

Russia has the largest group of natural gas reservoirs in the world.

A pumping station in Russia moves natural gas through a pipeline.

Mining and Transportation

Natural gas may be trapped in an underground pocket, or reservoir, above a deposit of petroleum. Natural gas may also be trapped in its own reservoir.

To get natural gas out of the ground, workers drill a well into the gas reservoir. The gas rises through a pipe to the surface. Special equipment then purifies, or cleans, the gas.

The clean gas may be stored underground or sent through pipelines to where it is needed. Gas pipelines can be hundreds of miles long. Natural gas may also be cooled into a liquid form and then shipped in tanks.

Gecko

Geckos are small lizards known for their incredible climbing ability. There are about 750 species, or kinds, of gecko. They live in warm areas of the world in

a variety of habitats, from rain forests to deserts.

Geckos are among the world's smallest lizards. Most species are 1 to 6 inches (3 to 15 centimeters) long, including the tail. Geckos have a short, stout body and soft skin. Most are gray, brown, or dirty white, but a few kinds are green.

A gecko can climb very well because of the way its feet are designed. Each of its toes has thousands of tiny hairs on the bottom. At the end of each hair are hundreds of even tinier pads. As a gecko climbs, these pads spread out to create a strong sticking power. They allow a gecko to climb up polished glass walls and even run across ceilings.

Geckos usually are active at night, when they feed on insects. Unlike other rep-

Geckos are great climbers because their feet stick to many surfaces.

tiles, most geckos have a voice. Their sounds range from soft clicks or chirps to sharp cackles or barks.

Genetics

Genetics is the study of heredity, or how certain features pass from parents to their offspring, or young. Every kind of plant and animal produces young of its own species, or type. The young resemble their parents. But offspring are not usually exactly the same as their parents. For example, their hair color or height may be different. Genetics explains how offspring get some of their parents' features, or traits, but not others.

Genes, Chromosomes, and Reproduction

Genes are the basic units of heredity. They carry information about a living thing, including its traits. Genes exist inside the cells that make up living things. Threadlike structures called chromosomes carry the genes. Each chromosome is made up mainly of a substance called deoxyribonucleic acid, or DNA. The genes are short sections of DNA.

In human beings most cells have 23 pairs of chromosomes, or 46 in all. The sex cells—sperm cells and egg cells—each have only one set of 23 chromo-

somes. This is because of the way reproduction works. Every human baby begins as an egg cell from the mother. First, though, a sperm cell from the father must enter the egg. When this happens, the sperm's chromosomes unite with the chromosomes from the egg. Together they form 23 pairs of chromosomes. The egg then begins to divide over and over to grow into a baby. As the baby grows, each of its cells gets a copy of the original chromosomes.

A Boy or a Girl?

One pair of chromosomes in a baby causes it to be a boy or a girl. This pair consists of chromosomes labeled X or Y. Sperm cells have either an X or a Y chromosome. But an egg cell always has an X chromosome. Therefore, when a sperm unites with an egg, the new cell has either one X and one Y chromosome or two X chromosomes. A cell with one X and one Y chromosome produces a boy. A cell with two X chromosomes produces a girl.

If a sperm with an X chromosome unites with an egg cell, the result is a baby girl. If a sperm carrying a Y chromosome unites with an egg cell, the result is a baby boy.

How Traits Are Inherited

A baby's chromosomes carry a set of genes from the father and another set from the mother. These genes work together to produce the baby's traits. Each gene has a special task—for example, giving color to the baby's eyes.

Some genes are dominant, or stronger than others. A child may get a brown-eye gene from the father and a blue-eye gene from the mother. Because the brown-eye gene is dominant, it takes over the job of coloring the child's eyes. A child has blue eyes only if he or she receives two blue-eye genes, one from each parent.

Children of the same parents can end up with different traits. This is because each parent carries two genes for every task but gives each child only one of these. The father, for example, may have one gene for brown eyes and one gene for blue eyes. His first child may get the brown-eye gene. His second child may get the blue-eye gene.

Every human has two genes to control traits such as eye color. They get one gene from each parent. This is how traits get passed from one generation to the next.

Identical twins can be hard to tell apart.

There are two kinds of twins: identical twins and fraternal twins. Identical twins have exactly the same traits because they have exactly the same genes. Identical twins form from one egg that has united with a sperm. This egg splits in half, and each half grows into a separate baby. Fraternal twins have different sets of genes. This is because they form from two separate eggs that united with two different sperm.

Genetic Problems

Sometimes a gene does not work as it should, or it works in a harmful way. The result may be a defect in a part of the body or a disease. A condition called albinism is an example. It occurs when the gene that controls the body's production of coloring substances does not work properly. People with this condition are born without color in their eyes, hair, or skin. Muscular dystrophy is a disease caused by a defective gene. The disease causes the muscles to weaken over time.

History of Genetics

In the 1850s and 1860s an Austrian monk named Gregor Mendel studied pea plants in his garden. He found that there were rules for how traits passed from one generation of pea plants to the next. The rules are the same for every plant and animal. During his lifetime no one understood how important these findings were.

In 1900 people rediscovered Mendel's work. From then on, the new science of genetics grew rapidly. In 1953 James Watson of the United States and Francis Crick of England discovered the structure of DNA. Their studies helped scientists understand how genes work and how they make copies of themselves.

By the mid-1970s, scientists had learned how to locate, remove, and insert specific genes in DNA. This work is called genetic engineering. By the 1990s scientists could clone animals, or produce animals that have exactly the same DNA as another animal. In 1996 researchers in Scotland produced the first clone of an adult mammal—a sheep. Some scientists worked toward cloning human beings. But others saw this work as dangerous and wrong.

In 2003 a team of researchers finished a project to identify and locate all the genes in all human DNA. The results will help scientists in the study of human biology and medicine.

Genghis Khan

Genghis Khan was a conqueror who brought together the wandering peoples of central Asia more than 800 years ago. He made their lands into the state of Mongolia. Then he took his armies beyond Mongolia. They built up a huge empire. They also killed many people and destroyed many cities.

Genghis Khan was born in about 1162 in northern Mongolia. His name at first was Temüjin. At that time Mongolia was home to a number of related, but separate, peoples called Mongols. Temüjin's father was Yesügei, the chief of one Mongol group. When Temüjin was 9 years old, his father was killed by enemies from another Mongol group, the Tatars. Temüjin then became chief. Though he was young, Temüjin won many followers.

Genghis Khan

Did You Know?

Temüjin was named after an enemy his father had defeated.

Temüjin gradually built up a large army. He used it to conquer neighboring groups, including the Tatars. He unified those groups into a single Mongol nation. In 1206 the people named him Genghis Khan, which means “universal ruler.”

Genghis Khan then set out to conquer other lands. First he invaded northern China. In less than 10 years he and his generals took over most of China. Genghis Khan next conquered the land that now makes up Turkmenistan and Uzbekistan. His generals raided Iran and Russia.

Genghis Khan began his last battle against China in 1226. He died on August 18, 1227. Mongols then controlled land from the China Sea to the European part of Russia. Genghis Khan’s sons and grandsons expanded the Mongol Empire even more.

Geography

Geography is a science that deals with Earth’s surface. People who study geography are called geographers. Geographers are interested in Earth’s physical features, such as mountains, deserts, rivers, and oceans. They are also interested in the ways that people affect and are affected by the natural world.

Branches of Geography

Geography can be divided into two branches: physical geography and human geography. Physical geographers

A map is a helpful tool in the study of geography.

observe, measure, and describe Earth’s surface. They study how landforms develop and how they change. They look at how different landforms affect climate. They also study how people change the land through such activities as building cities, digging mines, and clearing forests.

Human geography focuses on where people live, what they do, and how they use the land. Human geographers might study why cities and towns develop in certain places. Others study the cultures of different peoples, including their customs, languages, and religions.

How Geographers Work

Geographers use a number of methods and tools in their work. The simplest method is going out to a place to observe and gather information. This is called fieldwork. Geographers use photographs taken from the air to see things that they cannot see from the ground. They also depend on spacecraft called satellites to take photographs and collect information from far above Earth.

Geographers use computers to help them make sense of the information they receive.

The main tool used by geographers is the map. People who make maps are called cartographers. Geographers use maps to display the information they have gathered. Topographic maps show natural land formations, such as the huge landmasses called continents. Geographers also use maps to show how people have divided the land. Political maps show the boundaries of countries and other divisions.

Geology

Geology is the study of the physical features and history of Earth. Scientists who work in geology are called geologists.

Geology is an important science for many reasons. It answers questions about how Earth came to have its present shape and form. It is useful for finding important materials in Earth's crust, such as oil. Geology is also helpful for predicting earthquakes and other natural hazards.

Branches of Geology

Geologists work in many different branches of geology. Some geologists study rocks and minerals and how they formed. Some study the structure of Earth and the different forces and

actions inside it. Some study how landforms, such as mountains, on Earth's surface develop and change. Some geologists, called paleontologists, study fossils. (Fossils are the traces of prehistoric plants and animals.) Still other geologists work out how humans can use Earth's resources without harming the environment.

Geologic Time

Most geologists agree that Earth started forming about 4.6 billion years ago. After about 700 million years it had developed a solid crust. Geologists use the words geologic time to describe the vast amount of time that has passed since then. They divide this time into three broad periods, called eons. The two oldest eons are part of what is called Precambrian time. The third eon, which includes present time, is called the Phanerozoic eon. It is divided into three periods called eras—the Paleozoic, Mesozoic, and Cenozoic eras.

Geologists learn about these different periods by studying the many layers of rock in Earth's crust. The deepest layers

Geologists set up equipment at Mount Saint Helens in Washington State.

Did You Know?

Petrology and petrography are branches of geology that deal with the study of rocks.

are the oldest. More recent layers are closer to the surface. Each layer contains unique types of rocks and fossils. These give geologists many clues about Earth's history.

Geometry

Geometry is a kind of mathematics that deals with shapes and figures. Geometry explains how to build or draw shapes, measure them, and compare them. People use geometry in many kinds of work, from building houses and bridges to planning space travel.

Points, Lines, and Angles

Points, lines, and angles are basic terms of geometry. A point is an object that has no length or width. It is usually represented by a dot. A line is an object that

extends without end in both directions. It is usually drawn with arrowheads to show that it goes on forever. A line segment is a part of a line with two end points. A ray is half of a line, with one end point.

Two rays with the same end point form an angle. If the rays are the two halves of a single line, the angle is called a straight angle. A straight angle can be thought of like a book opened flat on a desk. An angle opened half that far is called a right angle.

Angles are measured in degrees. A right angle measures 90 degrees. Angles that are smaller than a right angle are called acute. Angles that are larger than a right angle but smaller than a straight angle are called obtuse.

Polygons

A polygon is a closed figure formed by joining together line segments. A polygon with three sides is a triangle. Some kinds of triangles have special names. If all three sides of a triangle are equal, it is an equilateral triangle. A triangle with one right angle is a right triangle.

A polygon with four sides is called a quadrilateral. A rectangle is a quadrilateral with sides that form four right angles. A square is a special kind of rectangle with four sides of equal length.

Polygons with more than four sides are named by combining Greek words for numbers with the letters "-gon." For example, a pentagon is a five-sided fig-

ure. A hexagon has six sides, and an octagon has eight.

Circles

Some geometric shapes have curves instead of straight lines. The most familiar of these shapes is the circle. All the points on the edge of a circle are the same distance from the center. This dis-

tance is called the radius. The diameter is the distance across a circle through the center. It is twice the length of the radius. The length around the outside of the circle is called the circumference.

Solid Figures

Triangles, squares, and circles are flat. Other geometric shapes are solid figures. A cube is a solid figure with flat surfaces. A square box is an example of a cube. A sphere, such as a baseball, is a solid figure with a curved surface. Cones, cylinders, and pyramids are other solid figures.

George III

King George III ruled Great Britain during the time of the American Revolution. Problems with the colonies had started before George became king. Even so, people remember George III as the king who lost the American colonies.

Early Life

George William Frederick was born in London, England, on May 24, 1738. He became king when his grandfather, King George II, died in 1760. George III's father had died earlier.

Losing the Colonies

By the time George became king, British monarchs (kings and queens) had lost much of their power to Parliament. Parliament was the group of lawmakers in Britain. Beginning in the 1760s Parlia-

Did You Know?

King George III wears his military uniform in a portrait from about 1800.

ment tried to raise money by taxing the American colonies. The colonists complained that Parliament had no right to tax them because they had no representatives in it.

In 1775 George announced that the colonists were committing treason, the crime of betraying one's country. In the same year, the colonists began fighting for independence. In the U.S. Declaration of Independence, Thomas Jefferson attacked George and called him a tyrant (a cruel, lawless ruler). The colonies won independence from Britain in 1783.

Illness and Death

After the American Revolution, George became very ill. Modern doctors think that he may have suffered from a disease called porphyria. His disease made him hallucinate (see things that were not there). At the time, people called his condition madness.

In 1811 his son Prince George took over the throne as regent, or substitute king. George III died on January 29, 1820. Prince George became King George IV.

Georgetown

Population
(2002 estimate)
137,330

Georgetown is the capital of Guyana, a country on the northern coast of South America. The city lies on the Atlantic Ocean. It is Guyana's only large city.

Georgetown is the country's center of business and manufacturing. It is also the main port. Sugar processing is a major industry in the city.

The British founded Georgetown in 1781. They named the settlement after King George III of England. French and later Dutch settlers took over the town. The British regained control in 1812. In 1831 they made all of Guyana into a British colony. Guyana became an independent country in 1966. Georgetown was made its capital.

Guyana

Georgia

The U.S. state of Georgia is called the Empire State of the South. This nickname reflects Georgia's large size and economic strength. Georgia is as important to the South as New York (the Empire State) is to the Northeast. The state was named for King George II of England. In 1732 the king granted permission for the area to become a colony. It is the only United States state with a name honoring an English king. The capital is Atlanta.

Geography

Georgia is bordered on the south by Florida, on the east by the Atlantic Ocean and South Carolina, on the north by North Carolina and Tennessee, and on the west by Alabama. The Savannah River runs along the eastern edge of the

state and the Chattahoochee River runs along the western edge. The Sea Islands lie off Georgia's Atlantic coast.

The southern part of Georgia is a coastal plain that covers about three fifths of the state. A belt of hills separates the upper edge of this region from a raised flat area that contains most of the state's important cities and farms. The Appalachian Mountains are in the north. In general, Georgia has mild winters and hot and humid summers.

People

The majority of Georgians are of European heritage. Many are of Irish, British, or German descent in particular. African Americans make up about 30 percent of the population.

Almost three quarters of Georgia's people live in urban areas. More than half of the state's entire population lives in and around Atlanta. The city is an important commercial and financial center of the Southeast as well as the region's transportation hub.

Economy

The service sector is the largest part of Georgia's economy. The state's valuable tourism industry provides service jobs in hotels, restaurants, and transportation businesses. Major farm products are broiler chickens, chicken eggs, cotton, and peanuts. Georgia is sometimes called the Peach State because of the

large number of peaches it grows. Manufacturing in the state includes the production of textiles, foodstuffs, chemicals, and paper. One Georgia product, the soft drink Coca-Cola, is famous worldwide.

History

When the first Europeans arrived in the area they encountered mostly Cherokee and Creek Indians. In about 1540 the Spanish explorer Hernando de Soto passed through the region. As a result of de Soto's travels, the territory was claimed by Spain. By the second half of the 1600s, however, the British were also in the area. The English colony of Georgia was founded at Savannah in 1733 by General James Oglethorpe.

Georgia was a major battlefield during the American Revolution. After the

revolution it entered the Union in 1788 as the nation's fourth state. Georgia's economy in the 1800s depended heavily on slave labor. The state therefore joined other slave states in forming the Confederacy during the American Civil War. In 1864 Union Army troops under General William T. Sherman left a path of destruction in their "march to the sea" from Atlanta to Savannah. Georgia's economy suffered as a result of the war. Many factories were built during World War II, in the 1940s, and that helped Georgia recover.

One of Georgia's most famous political figures is Jimmy Carter. After serving as the state's governor in the early 1970s, he served a term as U.S. president from 1977 to 1981. Georgia's population grew by more than 25 percent between 1990 and 2000. This increase made Georgia one of the fastest-growing U.S. states during that period.

Georgia, Republic of

The Republic of Georgia is a small country in the Caucasus Mountains of Asia. Georgia's name in the Georgian language is Sakartvelo. The capital is Tbilisi.

Geography

Georgia borders Russia, Azerbaijan, Armenia, and Turkey. The Black Sea lies to the west. The Caucasus Mountains run through the north and the south. Near the Black Sea are fertile lowlands. Most of Georgia has a mild climate.

Plants and Animals

Forests of oak, beech, alder, and fir trees cover more than one third of the land. The mountains are home to goats and Caucasian antelope. Wild boars, deer, brown bears, lynx, wolves, and foxes live in the forests.

People

Ethnic Georgians make up most of the country's population. Armenians, Rus-

sians, and Azerbaijanis are the largest minority groups. Most people follow Georgian Orthodox Christianity or no religion at all. Muslims form a significant religious minority. More than half of the population lives in cities.

Economy

Manufacturing, mining, agriculture, and tourism are all key parts of Georgia's economy. Factories manufacture food products, iron and steel, and transportation equipment. Farms produce mainly potatoes, wheat, and corn. Wine made from local grapes, tea, and citrus fruits are important exports. The Black Sea coast has many tourist resorts.

History

Ancient Romans, the Byzantine Empire, Persians, and Arabs controlled parts of Georgia at different times until the 1100s. Then a united kingdom of Georgia was formed. It lasted until 1220, when Mongols invaded. Ottoman Turks and Persians later ruled the region. Russia took over in the 1800s. In 1921 Georgia became a republic of the Soviet Union.

Georgia declared its independence in 1991. The country soon faced rebellions in several of its regions that continued into the 21st century.

Geranium

The geranium is a popular flower-garden plant.

Geraniums are flowering plants that grow in the wild as well as in gardens. There are many different types of geranium. Most have strong fragrances, or smells. Geraniums are common in mild, somewhat moist climates in North America, Europe, and Africa.

Geraniums' flowers may be round, ragged, or frilled. The flowers occur in clusters and come in shades of pink, deep red, violet, and white.

Many of these plants have been developed for their pleasant fragrances. When their leaves are rubbed, they may smell like mint, fruit, flowers, spice, or even chocolate. The leaves tend to be thick, though the leaf shapes vary.

Gerbil

Gerbils are small rodents that are similar to mice and rats. There are almost 100 species, or kinds, of gerbil.

They live in Africa and Asia, mainly in deserts and other dry, sandy areas. For this reason, gerbils are sometimes called sand rats. Some kinds also live in grasslands, farm fields, or forests. The Mongolian gerbil is a popular household pet.

Gerbils have soft fur that is usually pale brown or gray. Their eyes and ears are large. Most gerbils are about 4 to 6 inches (10 to 15 centimeters) long, not including the tail. The tail is usually long and hairy. Many species have long hind legs used for leaping.

Gerbils live in burrows, which are underground holes and tunnels that they dig. Most species come out of their burrows at night to collect food. A few kinds are active during the day. Gerbils mainly eat seeds, roots, nuts, and insects.

A hairy-footed pygmy gerbil rests on the sand of an African desert.

Germany

A farmhouse stands in the mountains of Germany's Black Forest.

For 45 years after World War II, the European country of Germany was divided into two republics. East Germany was a Communist country, while West Germany was a democracy. The collapse of Communism led to the reunification of Germany in 1990. Germany's capital is Berlin.

Geography

Germany shares borders with Denmark, Poland, the Czech Republic, Austria, Switzerland, France, Luxembourg, Belgium, and The Netherlands. Its northern coasts touch the North and Baltic seas.

The south contains the Bavarian Alps. The vast Black Forest, so called for its thick, dark groves of trees, covers the southwest. Central Germany is hilly and forested. The north is a wide, sandy

plain. Germany's longest river is the Rhine, which runs along the western border. Much of Germany has a temperate climate, with warm summers and cool, overcast winters.

Plants and Animals

Germany's main type of tree is pine, followed by beech and oak. Millions of trees have been damaged by a form of pollution known as acid rain. Germany's animals include deer, wildcats, hares, wild boars, badgers, beavers, and foxes. Birds include thrushes, starlings, sparrows, owls, woodpeckers, herons, and falcons.

People

Almost 90 percent of the population is German. There are small groups of Turks and other Europeans. German is the official language. Most Germans are Christians. The north and east are largely Protestant, while the south and

west have more Roman Catholics. Many people follow no religion. Nearly 90 percent of the population lives in urban areas.

Economy

Services, including health care, education, and tourism, form the largest part of Germany's economy. However, Germany is one of the top industrial countries in the world. It produces automobiles, machinery, chemicals, food products, electrical equipment, metals, and other goods. Germany also has deposits of coal and natural gas.

Although agriculture is a small part of the economy, German farms generally produce more grains, milk, and meat than the country needs. One major crop is hops, which is used in Germany's famous beer industry.

History

During ancient and medieval times hundreds of Germanic, Celtic, and Slavic tribes lived in what is now Germany. The Franks unified the tribes in the 500s. After the death of the Frankish king Charlemagne in 814, the eastern part of his empire became Germany. Germany was made up of loosely connected states. Many kings of Germany also ruled the Holy Roman Empire, which covered much of central Europe.

In the 1500s the German priest Martin Luther led the Reformation. The movement criticized Roman Catholicism and led to the formation of Protestant forms of Christianity.

People sit in an outdoor restaurant in Munich. The city is one of the largest in Germany. It attracts many tourists.

The German Empire

The Holy Roman Empire weakened in the mid-1600s, and the German state of Prussia rose in importance. In the late 1800s Prussia united many of Germany's states to form the German Empire, or the Second Reich. Germany became Europe's leading power. It also acquired colonies in Africa, Asia, and the Pacific Ocean.

During World War I (1914–18) Germany and its allies, Austria-Hungary and Turkey, battled Great Britain, France, Russia, Italy, and the United States. The war ended with a disastrous defeat for the German Empire. Germany lost land to surrounding countries. It also lost its colonies.

The Third Reich

After World War I a democratic government known as the Weimar Republic took power in Germany. It collapsed, however, as the country struggled with a poor economy. Adolf Hitler and his Nazi Party gained control in 1933. Hit-

ler wanted to create a new German Empire, called the Third Reich.

Hitler's plans led to World War II. Germany, allied with Italy and Japan, formed the Axis Powers. They fought the Allies—Britain, the Soviet Union, and the United States. By the time the Allies defeated the Axis in 1945, the Nazis had killed millions of people, including about 6 million Jews, in a massacre called the Holocaust.

Division of Germany

Following World War II the Allies divided Germany into four zones. The United States, Britain, France, and the Soviet Union each controlled a zone. In 1949 the United States, Britain, and France merged their zones to create the Federal Republic of Germany, or West Germany. West Germany had a democratic government.

The Soviet zone became the German Democratic Republic, or East Germany.

Like the Soviet Union, East Germany had a Communist government. Within East Germany was the city of Berlin, which was also divided into eastern and western sections. Millions of East Germans fled to West Germany through Berlin. In 1961 East Germany built the Berlin Wall, which kept western Berlin separate from the rest of East Germany.

Reunification

In 1989 the Communist government of East Germany collapsed. People began tearing down the Berlin Wall. Tens of thousands of East Germans crossed into West Berlin to celebrate their new freedom. East and West Germany were officially reunited in 1990. The country then began modernizing eastern Germany's economy. Germany also joined the European Union.

Did You Know?

Geronimo's Apache name was Goyathlay, which means "one who yawns." The Mexicans were the first to call him Geronimo.

Geronimo

The legendary warrior Geronimo was a leader of the Chiricahua band of the Apache people. The Apache lived in northern Mexico and what is now the southwestern United States. Geronimo spent most of his life fighting Mexican and U.S. settlers and soldiers who wanted to take the tribe's land.

Geronimo was born in June 1829 in a part of southeastern Arizona that was then part of Mexico. At the age of 17 he became a member of his tribe's warrior council and took part in fights between the Apache and the Mexicans. In 1858 the Mexicans killed his mother, wife, and children. Wanting revenge, Geronimo fought even more fiercely. His skill and courage in battle made him an Apache leader.

Geronimo

In 1874 the U.S. government forced Geronimo and some 4,000 other Apache to move to a reservation in Arizona. There they were often short of food and denied their traditional customs. Geronimo and his followers left the reservation and led violent raids against settlers in Arizona for more than 10 years. He surrendered in 1886, and he and his followers were sent to Florida as prisoners and forced to do hard labor. In 1894 Geronimo was moved to Fort Sill in Oklahoma Territory. He died there on February 17, 1909.

Gestation

Gestation is the period of time that a mammal carries her offspring, or babies, inside her body before giving birth. The length of gestation is different for each type of mammal. Larger animals usually have longer gestations than smaller animals. Human gestation, or pregnancy, lasts about nine months. An elephant's gestation lasts about 22 months. In squirrels, gestation lasts only about six weeks.

Before birth, mammals grow inside an organ called the uterus in the mother's belly. The uterus is a part of the body's reproductive system. A structure called a placenta usually connects the developing baby to the uterus. The placenta brings nutrients from the mother's body to the developing baby, or fetus.

All animals go through a period of development before they are born. For mammals this takes place inside the mother's body during gestation. For other animals this may take place inside an egg. The developing animal is called an embryo. The embryos of many animals look alike in the earliest stages. But they soon start to develop into their different forms.

Gestation in Marsupials

Marsupials are mammals whose babies usually develop in a pouch after birth. Some examples are kangaroos, koalas, and opossums. Marsupials do not have true placentas. For this reason, marsupial gestation is relatively short. Even the largest type of kangaroo is born after about 40 days.

Marsupial babies are born tiny and undeveloped. Right after they are born they crawl inside a pouchlike flap of skin at the front of their mother's body. There they continue to develop until they are ready to leave the pouch.

Gestation in Placentals

Placentals are mammals that have placentas during gestation. Humans, cats, dogs, deer, whales, and most other mammals are placentals. The gestation of placentals is usually longer than the gestation of marsupials. This means that the babies of placentals are born more developed than marsupial babies.

However, the babies of different placentals are born at different levels of development. Placentals also have different lengths of gestation. Horses have a gestation of about 11 months. Their babies can walk hours after birth. Chimpanzees have a gestation of about eight months. Their babies are helpless for a few months after birth.

Human Gestation

Human gestation, or pregnancy, is divided into three periods called trimesters. Each lasts about three months.

In the first trimester, the fetus develops a heartbeat and the beginnings of all the other body parts. The fetus also grows an umbilical cord, which connects it to the placenta. At three months, the fetus weighs less than 1 ounce (28 grams). In the second trimester, the fetus starts to move around in the uterus. At six months, it weighs up to 2 pounds (900 grams). In the third trimester, the baby continues to grow bigger and stronger. By the time of birth, the baby weighs about 7.5 pounds (3.5 kilograms).

Did You Know?

The Virginia opossum has the shortest known gestation—about 12 days.

Ghana

Ghana is a country in western Africa. In 1957 it became the first African colony south of the Sahara Desert to win independence. Ghana then led the way in establishing industries and a modern educational system. It also produced important leaders, including Kofi Annan, a secretary-general of the United Nations. Ghana's capital and largest city is Accra.

Geography

Ghana is bordered by Côte d'Ivoire on the west, Burkina Faso on the northwest and north, and Togo on the east. On the south Ghana has a coastline on the Gulf of Guinea, which is part of the Atlantic Ocean. Ghana's climate is warm year-round, with dry and rainy seasons.

Ghana's land is mainly flat. The southwest, northwest, and north contain higher plateaus and some hills and valleys. Low mountain peaks rise in the

Women paint the walls of a village in Ghana.

east. The Black Volta and White Volta rivers flow southward from Burkina Faso. The two rivers feed Lake Volta, one of the largest artificial lakes in the world. It was formed behind the Akosombo Dam, which produces electricity for Ghana.

Plants and Animals

Tall grasses and scattered trees cover the northern two thirds of the country. Forests cover most of the southern third. Ghana's trees include the silk cotton tree, the wawa tree, and the African mahogany.

Ghana's large mammals include lions, leopards, hyenas, antelope, elephants, buffalo, wild hogs, chimpanzees, and monkeys. Crocodiles and hippopotamuses live in the rivers. Ghana also has numerous birds, including parrots, hornbills, and kingfishers. Among its snakes are cobras, pythons, puff adders, and horned adders.

People

The people of Ghana belong to one broad group divided into about 75 different tribes. The largest tribe is the Akan. Other large tribes include the Mole-Dagbani, the Ewe, the Ga-Adangme, and the Gurma. English is the official language, but each tribe has its own language. More than half of the people are Christian. Many others practice traditional religions or Islam.

Economy

Ghana's economy is based on farming and mining. More than half of its workers are involved in agriculture. The country's main exports are gold and cocoa. Other crops include cassava, yams, bananas, corn, sorghum, rice, and millet. Ghana also mines diamonds, manganese, and bauxite, which is used to make aluminum. Logging, fishing, and manufacturing are also important.

History

Most of Ghana's present ethnic groups lived in the region when Portuguese explorers arrived in 1471. Because of its

gold mines, the area became known as the Gold Coast. In 1482 the Portuguese began building forts on the coast as headquarters for the gold trade. In the 1600s traders from other European countries set up their own forts.

Soon the Europeans began trading slaves as well as gold. In the 1700s the Ashanti, an Akan people, developed a kingdom in the south. They supplied slaves to the Europeans.

The British defeated the Ashanti and made the Gold Coast a colony in 1874. Beginning in 1949 Kwame Nkrumah led a movement for independence. The people held protests and set up their own government. In 1957 Britain gave Ghana its independence. Ghana was a model for other colonies to follow in their independence movements.

Independent Ghana was ruled at first by a prime minister. In 1960 the country became a republic with a president. Nkrumah was elected the first president. He took away some freedoms for groups that opposed his rule. In addition, the country became poorer.

The army and the police seized control of Ghana in 1966. Many different groups tried to take control for the next 26 years. In 1981 one government banned political parties. In 1992 the country gained a new constitution that restored democracy and political parties.

Ghana Empire

Ghana was a powerful trading empire in western Africa. The empire was most active from the 700s to the 1200s. It grew rich and strong by controlling large amounts of gold. The empire's lands are now partly in Mauritania and partly in Mali. It was not related to the current country called the Republic of Ghana.

Ghana was founded by the Soninke people. To their north lived Arab and Berber peoples who had salt and wanted gold. To their south lived African tribes who had gold on their lands and wanted salt. The Soninke handled trade between the two groups.

By 800 the Soninke had become highly organized. They conquered other tribes to form a mighty empire. They called their empire Wagadu, but other people called it Ghana because *ghana* was the king's title.

Several times in its history Ghana moved its capital. The last capital city was Kumbi. It was located about 200 miles (320 kilometers) north of modern Bamako, Mali. At its peak, before 1240, Kumbi was western Africa's largest city, with more than 15,000 people.

In 1076 a northwestern African Muslim group called the Almoravids took control of Kumbi. The Almoravids ruled for only a short time but did lasting damage to the empire. They disrupted trade routes and destroyed croplands with their flocks of grazing animals.

In 1203 the various groups living under Ghana's rule began to break away. One of these, the Susu, occupied Kumbi. In 1240 a chief named Sundiata destroyed the city. Sundiata then incorporated what was left of the Ghana Empire into his new Mali Empire.

Giant Sequoia

The giant sequoia is a huge evergreen tree. It grows only on the western slopes of the Sierra Nevada mountains in the U.S. state of California. Its scientific name is *Sequoiadendron giganteum*. It is related to the redwood.

The giant sequoia is so large that it is sometimes called simply the big tree. Some giant sequoias are more than 280 feet (85 meters) tall. They have huge trunks that are sometimes more than 100 feet (30 meters) around at the bot-

Giant sequoias tower above tourists in Sequoia National Park in California.

tom. The reddish brown bark can grow to more than 12 inches (30 centimeters) thick. Giant sequoias usually have branches only near the top because the lower branches fall away as the tree grows. The leaves are blue-green.

The giant sequoia is a conifer, which means that it produces cones that hold its seeds. At 3.5 inches (9 centimeters) long, the cones are tiny compared to the tree.

Giant sequoias can live to a very old age. Some are more than 3,500 years old. The wood is rich in chemicals that keep away insect pests and prevent rotting. The thick bark does not burn easily and helps to protect the giant sequoia from fire.

Gibbon

Gibbons are small apes of the rain forests of southeastern Asia. They spend most of their time in trees. They use their long arms to swing quickly from branch to branch. A gibbon can travel an amazing 10 feet (3 meters) in a single swing. On the ground, gibbons walk upright on two legs.

All apes belong to the group of mammals called primates, along with monkeys, humans, and some other animals. Gorillas, orangutans, chimpanzees, and bonobos are called great apes. Gibbons are called lesser apes. They are smaller and less intelligent than the other apes.

There are 14 species, or types, of gibbon. They vary in length from about 16 to 35 inches (40 to 90 centimeters). The

Gibbons live high up near the tops of the trees in rain forests. They have long, thin hands and feet that help them climb and hold onto branches.

siamang is the largest of the gibbons. Like all apes, gibbons lack tails. But gibbons have longer arms and thicker hair than the great apes do. Most gibbons are mainly shades of cream, brown, black, or gray. Some kinds have white hands and feet. In many species the males and females are different colors.

Gibbons eat mostly fruit. They may also eat leaves, insects, birds' eggs, and young birds.

Gibbons usually have only one mate during their lives. They live in small family groups. These families defend their home range with loud calls. These sounds warn other gibbons to stay away.

Gibraltar

As a fortress and colony, Gibraltar has been a symbol of British military strength since the 1700s. Commonly referred to as the Rock, it is the site of a British air and naval base that guards the Strait of Gibraltar. This important waterway between Spain and Africa con-

nects the Mediterranean Sea to the east with the Atlantic Ocean to the west.

Gibraltar is a peninsula that is about 3 miles (5 kilometers) long and less than a mile wide. It consists of a limestone mountain that rises sharply to a height of 1,396 feet (426 meters). A low, sandy strip of land connects it to Spain, 1 mile (1.6 kilometers) to the north. The Strait of Gibraltar is to the south. Across the strait is the African country of Morocco.

Two thirds of the residents of Gibraltar are Gibraltarians—people born in Gibraltar before 1925 and their descendants. Most Gibraltarians are of mixed British, Italian, Spanish, Maltese, and Portuguese descent. Many of the rest of the people are British.

Shipping, banking, and tourism are major sources of income in Gibraltar. The British military post and naval shipyard are also important to the economy. The leading manufacturing industries are shipbuilding and ship repair.

People have lived on Gibraltar since prehistoric times. Muslims held Gibraltar from 711 to 1462, when they lost it to Spain. In 1501 Gibraltar became part of Spain. Captured by the British in 1704, it became a British colony in 1830. It was an important port in World Wars I and II. Control of the territory has remained a source of dispute between Great Britain and Spain.

Ginkgo

Ginkgo leaves turn golden yellow in autumn.

More than 200 million years ago several types of ginkgo trees grew throughout the world. Today only one type of ginkgo still exists. Its scientific name is *Ginkgo biloba*.

The ginkgo trees of today came from China, where they grew in the wild. People in ancient China and Japan also grew them in the gardens of temples and palaces. Today ginkgos grow in cities, parks, and gardens on every continent but Antarctica. Some plant experts believe that groups of ginkgos no longer grow in the wild.

Ginkgos are very hardy trees. They resist damage from insects and fungi, plantlike living things that sometimes grow on trees. City pollution also does not harm ginkgos.

Ginkgo trees have the shape of a pyramid. They sometimes grow to be 100

feet (30 meters) tall. Their trunks may measure as much as 8 feet (2.5 meters) across. Ginkgo leaves are a dull gray-green color. They have a tough, almost rubbery texture. They are shaped like fans with a split in the middle.

Ginkgo trees are either male or female. Winds carry pollen from male trees to female trees. Female trees then produce large seeds. The seeds are round, silvery nuts surrounded by a smelly, yellowish covering.

People grow ginkgo trees for their beauty and the shade they provide. Roasted ginkgo nuts are considered special foods in China and Japan. Ginkgo leaves are used in some medicines.

Giraffe

The giraffe is the tallest living animal. It reaches a height of 18 feet (5.5 meters) or more. Giraffes live on the plains of eastern Africa. The scientific name of the giraffe is *Giraffa camelopardalis*.

Giraffes have a short body, but their legs and neck are very long. The coat is light brown with reddish brown spots. Many giraffes have two short horns between the ears. Giraffes have large nostrils and a good sense of smell. Their tongues are over 18 inches (45 centimeters) long.

Giraffes are plant eaters. They can reach leaves at the top of trees. But they do not eat grass. It is very hard for them to

Did You Know?

The ginkgo is also known as the maiden-hair tree.

The giraffe is built for reaching the treetops.

reach the ground because the neck is stiff. To drink, a giraffe must spread its legs far apart to reach down.

Giraffes live in herds of up to 20 animals. They use their good eyesight to watch for danger. Lions are the giraffe's main enemy. Giraffes try to gallop away from enemies, but they will fight if necessary. They can run more than 30 miles (48 kilometers) an hour.

A female giraffe gives birth to one calf at a time. The newborn can usually follow its mother around within hours. Giraffes live about 20 to 25 years.

Giraffes are still common in eastern Africa. They are protected there inside national parks. In other places, however, hunting has reduced the number of giraffes. People use giraffe skin to make leather.

Glacier

A glacier is a large area of thick ice that remains frozen from one year to the next. Glaciers also slowly flow over the land. Thousands of years ago, large parts of the world were covered with glaciers. At times glaciers covered about 30 percent of Earth's surface. At other times there were fewer glaciers than there are today.

Where Glaciers Are Found

Glaciers exist all over the world today. Most of Greenland is covered by thick sheets of glacier ice, as is Antarctica. There are smaller glaciers in the Rocky Mountains of North America, in the European Alps, in the Andes of South America, and even at mountainous points along the equator.

Glaciers cover about 10 percent of Earth's surface.

How Glaciers Form

Glaciers are formed when snow is packed down into ice. Snow crystals accumulate year by year in areas where the temperatures never become high enough to completely melt the snow and ice. When a large amount has accumulated, the snow is under great pressure from the weight. Eventually the snow becomes packed so tightly together that it turns into ice. It usually takes several years for glacier ice to form. In some cases, however, it may take thousands of years.

Effect on the Environment

Glacier ice today stores about three fourths of all the freshwater in the world. Many people believe that if temperatures around the world increased enough that the glaciers melted, sea levels would increase greatly and flood coastal areas. The world's sea levels are already rising about 0.08 inch (2 millimeters) every year. Scientists believe that melting glaciers cause much of this rise.

Despite this activity, it is unclear how much sea levels might eventually rise because of melting glaciers. Some scientists believe that if temperatures on Earth were to rise dramatically, the warming of the air would cause moisture to form in the atmosphere. This moisture would fall as rain and snow, which could balance out any melting that might occur.

Gladiator

Gladiators were professional fighters in ancient Rome. Their fierce battles—sometimes to the death—thrilled stadium crowds.

Gladiators were usually slaves and criminals. They trained at special schools. They used many kinds of weapons. Some fought with swords, while others used knives or tridents (three-pointed spears). Some had to battle wild animals.

The shows were held in huge arenas called amphitheaters. A fight usually went on until one gladiator was wounded. The crowd then decided whether the loser had fought bravely enough to be allowed to live.

The winner received palm branches and sometimes also money. A champion might be allowed to retire. Sometimes he gained his freedom.

A gladiator spears a leopard in a Roman artwork.

The first known gladiator show in Rome took place in 264 BC. Some later shows went on for weeks and used thousands of gladiators. Shows were held throughout the Roman Empire.

Gladiator shows gradually became unpopular. Constantine I outlawed them in AD 325. But they may have continued for at least 100 years after that.

Rome, Ancient

Glass

Onion-shaped pieces of blown glass float on a pond. They are part of an art display.

Glass is a useful and unique material. It usually lets light shine through, but it blocks liquids and air. Glass is easily breakable, but it can also be made very strong. And glass can be formed into all kinds of shapes.

Glass feels hard like a solid, but it is built more like a liquid. The tiny particles that make up true solids are arranged in a specific order. The particles in glass are arranged randomly, as in a liquid.

How Glass Is Made

The main ingredient for glass is pure silica, or sand. It takes very high temperatures to make glass from sand. By adding certain chemicals to the silica, the process needs much less heat. Chemicals can also make the glass stronger or add colors to it.

The silica and chemicals are called the batch. To begin, glassmakers add to the batch some glass that has already been made. This scrap glass helps the silica to melt.

Once the batch is melted, glassmakers remove any bubbles or streaks. Then the melted glass can be molded into shapes or rolled into sheets and allowed to harden.

Modern machines can quickly and easily create huge numbers of glass items. But artists still create unique items through a method called glassblowing. Glassblowers blow air through a tube into melted glass to create different shapes.

Uses

People use glass in countless ways. Glass windows allow light to pass through but keep out cold and rain. Electric light-bulbs are made of glass. Glass containers store all kinds of things, including food, drinks, and chemicals. Glass mirrors

Glassblowing was invented more than 2,000 years ago. Today most people who blow glass are artists.

reflect images. Lenses made of high-quality glass are used in microscopes and telescopes. Fiber-optic cables are bundles of tiny glass threads that carry information in the form of light. These cables are used to link telephones and computers over long distances.

History

The oldest known glass is more than 4,000 years old. Ancient Egyptians made glass beads and jars in about 2500 BC. Glassblowing probably began in Syria more than 2,000 years ago.

Glassmaking became important in Europe after the 1100s. Many European churches were decorated with stained-glass windows. In stained-glass windows, strips of lead hold pieces of colored glass together.

People in the American colonies started making glass in 1608. In 1825 a company in Pittsburgh, Pennsylvania, invented a glass-pressing machine. The

machine helped to make glass in huge amounts.

In the 1900s glass became easier to make, less expensive, and stronger. Glass windows and containers became everyday features of most homes.

Glider

A glider is an aircraft that soars through the air without the help of a motor. Some gliders look very much like airplanes. They have wings, a tail, a cockpit, an instrument panel, and a fuselage, or body. Some are even called sailplanes.

How Gliders Work

Gliders and airplanes with engines work in a similar way. A pilot controls both kinds of aircraft. Unlike airplanes with engines, however, gliders must be towed, or pulled, into the air to begin their flight. People may tow gliders using an automobile or a winch, which is a reel attached to a motor. A rope called a tow-

Sailplanes are the most advanced type of glider. They can soar for hours.

line connects the glider to the automobile or winch. The automobile or winch pulls the glider forward along the ground and into the wind. As the glider's speed increases, air flows over its wings at a faster and faster rate. This produces an upward force, called lift, on the wings. When this force becomes greater than the downward force of gravity, the glider can stay in the air. Then the glider pilot releases the towline. An airplane with an engine may also tow a glider into the air.

Did You Know?

A glider's wings are long and narrow. The shape helps the glider soar through the air.

Once the glider is flying, its pilot uses controls to move it higher, lower, and to the right or left. Glider pilots search for upward-moving air currents, called updrafts. The updrafts push the glider higher into the sky.

History

Gliders were developed in the late 1800s in Germany. By experimenting with gliders the Wright brothers were able to develop the first airplane in the early 1900s. Gliders were later used in warfare. For example, gliders carried many soldiers into enemy lands during World War II. Today gliders are used mostly for sport.

Global Warming

The average surface temperature on Earth is slowly increasing. This trend is known as global warming.

Factories that burn fossil fuels help to cause global warming.

Greenhouse Effect

To understand global warming, it helps to understand the greenhouse effect. A greenhouse is a glass house where plants grow. Glass lets light in and keeps heat from escaping. This trapped heat keeps the plants warm even when it is cold outside.

Likewise, Earth's atmosphere traps energy from the sun. Carbon dioxide and other gases—called greenhouse gases—in the air do this trapping. Without these gases too much heat would go back into space, and living things could not survive. However, as more greenhouse gases get into the air, they also trap more heat. This leads to global warming.

Causes

For much of Earth's history, greenhouse gases were not a problem. This situation changed as people came to depend on fossil fuels (oil, gas, and coal). People burn fossil fuels to power factories, run cars, produce electricity, and heat

houses. As fossil fuels burn, they release carbon dioxide into the atmosphere.

Also, people have cut down many forests. Trees use carbon dioxide when they make their own food. Fewer trees mean that less carbon dioxide is being taken out of the atmosphere.

Reasons for Concern

Scientists cannot tell how warm Earth may get over time. Some guess an increase between 2.5° F and 10.4° F (1.4° C and 5.8° C) by the year 2100. The warmer weather could harm living things. It also could cause polar ice caps to melt. This would cause sea levels to rise. Plants, animals, and buildings along coastlines would be in danger.

Stopping Global Warming

Global warming is a worldwide concern. Governments are trying to find ways to limit the amount of greenhouse gases put into the air. Individual people can help by driving less. They also can save energy by turning off unneeded lights and other electrical devices.

Goat

Goats are horned mammals that can be either wild or tame. People keep goats

People cut the long hair of Angora goats to use as a fiber called mohair. Mohair can be made into sweaters, scarves, and other types of clothing.

for their meat, milk, and wool. They are hardy animals that can live on coarse, thin grass. Goats can be raised on land that does not have enough plants for cows or sheep.

Goats are closely related to sheep, but they are not as solidly built. A domestic (tame) goat usually weighs about 100 to 120 pounds (45 to 54 kilograms). Goats also have straighter hair and a shorter tail than sheep. Both male and female goats may have horns. Some male wild goats grow horns up to 4 feet (1.2 meters) long. Most males also grow beards.

Goats eat grass and shrubs. A goat digests its food by swallowing and then regurgitating it, or bringing it back up from the stomach. The goat then chews it again in a form called cud.

Wild goats are animals of the mountains. They live in rugged parts of Europe, Asia, and northern Africa. They

can climb on cliffs and rocks without losing their footing. Most wild goats live in herds of 5 to 20 animals. Males and females usually come together only to mate.

Goats have been kept by people for about 9,000 years. People eat goat meat and drink goat milk. They also use goat milk to make cheese. Angora and cashmere goats are prized for their wool, which is made into clothing and rugs. Goatskins are used to make gloves, shoes, and other leather items.

Gobi

The Gobi is a vast desert in central Asia. It covers parts of Mongolia and China. The word *gobi* means “waterless place” in the Mongolian language.

The Gobi is surrounded by mountain ranges. Its land is mostly rocky plains with some hills. Summer in the Gobi is very hot, and winter is cold and harsh. Temperatures range from -40°F

The Gobi is bordered by several mountain ranges, including the Altai Mountains.

(-40°C) in January to 113°F (45°C) in July. The Gobi gets very little rain or snow. There are few rivers that flow year-round. Most of the water is underground.

Because of the dry climate, few plants grow in the Gobi. Rough grasses and low bushes are most common. Animals of the Gobi include wild camels and horses, gazelles, and antelope. There are also rodents, such as gophers.

The Gobi has a small population spread out over its huge area. Most of the people are Mongols, but some are Chinese. The people are mostly nomads who raise sheep, goats, cattle, and camels. They move around the desert with their animals.

Goldfish

The goldfish is a popular fish to keep as a pet in aquariums and ponds. It also lives in the wild, in rivers and lakes. The goldfish is a member of the carp family. Its scientific name is *Carassius auratus*.

Goldfish are naturally greenish brown or gray. But about 1,000 years ago people in China began breeding goldfish to create more colorful varieties. There are now more than 125 breeds of goldfish found throughout the world. They can be gold, red, orange, white, black, or a combination of colors.

Some breeds of goldfish have unusual features. For example, the celestial goldfish has eyes that jut out and always look upward. The lionhead has a growth on its head that looks something like a lion's mane.

Wild goldfish eat mostly plants and small animals. They grow to a size suitable for their environment. For example, aquarium goldfish are only 2 to 4 inches

(5 to 10 centimeters) long. But goldfish living in bigger spaces can reach a length of 2 feet (0.6 meter).

Goldfish breed during spring or summer. A female goldfish can produce thousands of eggs during each breeding season. The eggs usually hatch in less than a week. Goldfish have an average life span of 7 to 10 years. Some live as long as 25 years.

Gold Rush

The metal gold has been considered valuable for centuries. At times people have discovered places where gold can be dug out of the ground. This has created a gold rush, when many other people go to the same place hoping to find gold of their own.

The biggest North American gold rush took place in the U.S. state of California. It started in 1848 when a carpenter found gold at Sutter's Mill, near the Sacramento River. By 1849 there were 80,000 gold seekers—called “forty-niners”—in the area.

A gold rush in 1851 brought people to the Ballarat and Bendigo regions of Victoria, Australia. People found nuggets, or chunks, of gold as heavy as 200 pounds (75 kilograms).

Another major gold strike took place along the Klondike River in the Yukon Territory of Canada. Despite cold

Aquarium goldfish eat flake or pellet food. They also like to eat plants.

During the 1890s some people in Alaska looked for bits of gold in panfuls of river gravel. This was called panning for gold.

weather, about 30,000 people came between 1896 and 1899. Some gold was found in Alaska also.

In 1886 a diamond digger discovered gold in the Transvaal region of South Africa. Today, South Africa is the world's largest producer of gold.

Gold is often discovered in isolated areas with few people or towns. But because so many people are attracted by the gold, several major cities have grown up around such areas. These include San Francisco, California; Melbourne, Australia; and Johannesburg, South Africa.

Metal

Golf

Golf is an outdoor sport played with clubs and a small ball. It is played on a large, grassy area called a course. Golfers hit the ball into a series of holes on the course. The goal is to finish playing the course with as few hits, or strokes, as possible.

Playing Area and Equipment

A standard golf course has 18 holes. The playing area for each hole varies in length from about 100 to 600 yards (90 to 550 meters). Play begins at a spot called the teeing area. It is a flat, rectangular patch of short grass. In front of the

U.S. golfer Michelle Wie putts during a tournament in 2005.

teeing area is a mowed strip called the fairway. The fairway is the longest section of each hole. The fairway extends to an area of closely mowed grass called the green. Each green has a hole, called the cup, that measures about 4 inches (10 centimeters) across.

Many golf holes have features that make play more difficult. These include obstacles called hazards. One type of

hazard is a sand-filled pit called a bunker, or sand trap. Holes may also have water hazards, such as streams or ponds. An area called the rough runs along both sides of the fairway. The rough is made up of long grass, bushes, and trees.

Golfers use a variety of clubs to hit the ball. Each club has a small hitting area at the end of a shaft. Golfers may choose a different club for each swing at the ball. They choose a club based on how far they want to hit the ball.

A golf ball is small and hard. It is made mostly of rubber. It is usually white.

Playing the Game

Golfers start playing in the teeing area. From there, they hit the ball toward the hole. They try to keep the ball on the fairway and the green. They try to avoid hitting the ball into bunkers, water hazards, or the rough. When the ball reaches the green, a golfer uses a club called a putter for the final hits toward the cup. Every time the ball is hit, one stroke is counted.

The most common type of golf competition is called stroke (or medal) play. In stroke play, the player with the lowest total number of strokes is the winner. Individual golfers have another way of judging how well they are doing. They measure their play against a standard score known as par. Par is the number of strokes an expert player would need to complete a hole.

History

Historians believe that early forms of golf were played in the Netherlands first and then in Scotland. The modern game developed in Scotland. The first golf courses were fields of grass that sheep had clipped short while grazing. The world's oldest golf organization was formed in Scotland in 1744. It created the earliest-known rules of the game.

Golf balls were originally made of wood. Wood was replaced in the 1600s by boiled feathers stuffed in a leather cover. In the 1800s people started making balls with gutta-percha, a leathery material

A water hazard surrounds a green at the Augusta National Golf Club in Augusta, Georgia, in the United States.

that comes from certain trees. Balls made of hard rubber appeared in the 1900s.

Golf started to gain some world attention in the second half of the 1800s. At that time British golfers were generally considered to be the best in the world. John Henry Taylor, Harry Vardon, and James Braid were famous British golfers of the period. In the 1920s golfers from the United States began to excel. Bobby Jones, Walter Hagen, and Gene Sarazen were outstanding U.S. golfers from that time. Arnold Palmer, Jack Nicklaus, and Tiger Woods were later stars. Great women golfers included Patty Berg, Mickey Wright, and Annika Sorenstam.

Goodall, Jane

The British scientist Jane Goodall is known for her research on chimpanzees. She studied the animals for many years in the East African country of Tanzania. Her discoveries changed the way chimpanzees are studied and understood.

Jane Goodall was born on April 3, 1934, in London, England. At a young age she became interested in animals. By age 11 she dreamed of living among Africa's wildlife.

To earn money to travel to Africa, Goodall left school at age 18 and began working. At age 23 she arrived by boat in Kenya. She soon became an assistant to Louis Leakey, a famous scientist.

Jane Goodall watches chimpanzees in Kenya.

In 1960 Goodall set up camp on the shores of Tanzania's Lake Tanganyika. She studied chimpanzees close-up in their natural setting. It took months for Goodall to gain the chimps' trust, but her patience paid off.

Through her observations, Goodall changed many ideas about chimpanzees. She saw a chimpanzee make a tool, which it used to get food. Scientists had believed only humans were toolmakers. She also found that chimpanzees eat both meat and plants. Finally, Goodall observed that each chimpanzee had a distinct personality and emotions.

Goodall stayed in Tanzania until 1975. She wrote several books about her work.

Chimpanzee

Goose

Geese are large birds with loud, honking calls. Along with ducks and swans, they belong to a group of birds

called waterfowl in North America and wildfowl in Europe. These birds are equally at home on the water, on the land, or in the air. Common species, or types, of goose include the Canada goose, the greylag, the barnacle goose, and the snow goose.

People have kept and bred geese for at least 4,000 years. People eat goose meat and use goose feathers to stuff pillows and quilts. In addition, hunters shoot wild geese for sport.

Where Geese Live

Geese live near water, mostly in the northern half of the world. Many geese migrate, or fly long distances between their summer and winter homes. They nest in cold northern regions during the summer and fly south for the winter. However, some Canada geese live in the same parts of the United States or Canada year-round.

Physical Features

Geese are generally larger than ducks but smaller than swans. For instance, the

The Canada goose is the most common wild goose in North America.

Did You Know?

A male goose is called a gander. Young geese are called goslings.

Canada goose is about 36 inches (91 centimeters) long. But geese have many features in common with ducks and swans. They have webbed feet, which help them paddle through water. They also have a gland near the tail that makes oil. This oil helps protect the feathers from water. An inner layer of soft feathers called down helps to keep waterfowl warm.

Most geese are black, brown, gray, or white. They have heavier bodies and longer necks than ducks do. Geese are also better at walking than other waterfowl are. This is because their legs are farther forward on their bodies.

Geese have humped bills that become narrower toward the tip. Their bills are good for grasping grasses, which is their main food.

Gorbachev, Mikhail

Mikhail Gorbachev was the last leader of the country called the Soviet Union. Gorbachev's efforts to change his country helped to lead to the breakup of the Soviet Union in 1991.

Mikhail Sergeyevich Gorbachev was born on March 2, 1931, at Privolye, in southwestern Russia. At that time, Russia was a part of the Soviet Union. A group called the Communist Party ruled

Mikhail Gorbachev

the Soviet Union. Gorbachev joined the Communist Party in 1952. He received his law degree from Moscow State University in 1955.

Gorbachev rose steadily in the Communist Party. In 1985 he became the party's general secretary. This made him the leader of the Soviet Union.

When Gorbachev came to power the Soviet Union was a very strict country. The people were not allowed to voice their opinions openly. The country was often in conflict with other countries, especially the United States. Over time Gorbachev began to make changes. He allowed greater freedom of speech. He also developed better relations between the Soviet Union and other nations.

Gorbachev's changes led to an unexpected result—the end of Communism in Europe. Communists ruled several countries around the Soviet Union. The people in those countries began to demand change as well. Eventually the governments collapsed. In the Soviet Union itself, Gorbachev allowed real elections for the first time.

Many people praised Gorbachev for the changes he made. However, some Communists opposed Gorbachev's rule. In August 1991 a group of them tried to take control of the government by force. The takeover failed, but Gorbachev's position had weakened. On December 25, 1991, Gorbachev quit the presidency. By the end of the year the Soviet Union had officially ceased to exist.

Gorilla

Gorillas are the largest apes. They are also the largest animals of the group called primates, which also includes the other apes, humans, and monkeys. After

Adult male gorillas are called silverbacks because they have gray or silver hairs on their lower back.

chimpanzees and bonobos, gorillas are the closest living relatives to humans. Movies often show gorillas as fierce creatures. But they are actually peaceful and gentle animals.

Gorillas live in rain forests in Africa. There are three kinds of gorilla. The western lowland gorilla is found in western Africa. The eastern lowland gorilla and the mountain gorilla are found in east-central Africa. All gorillas are endangered, or at risk of dying out completely. The mountain gorilla has become especially rare.

Adult male gorillas may be 5.5 feet (1.7 meters) tall and weigh 300 to 600 pounds (140 to 270 kilograms). The females weigh about half as much as the males. Adult gorillas have long, strong arms and short, stocky legs. The chest is very thick and strong. The males have a bony crest on top of the head. Gorillas have a coat of black hair except on their faces, hands, and feet.

Gorillas live in family groups of about 6 to 30 animals. One or two older males lead the group. Gorillas use their arms and legs to walk. They support part of their weight on the knuckles of the hands. They rarely stand up straight. Gorillas spend most of their time on the ground. But they may also climb trees to sleep and feed. Gorillas eat plants, including fruits, leaves, stalks, and shoots.

Did You Know?

If threatened, a male gorilla may beat his chest and make loud sounds to scare away intruders.

Gospel Music

Gospel music is a form of African American religious music. Worshippers play and sing gospel music at some Protestant Christian church services. The word gospel means “good news,” and gospel songs often praise God or Jesus. Many gospel songs also describe struggles and hard times.

Small groups of singers, choirs, and soloists (single singers) perform gospel music. Singers are usually very emotional and expressive. A wide range of instruments—for example, organ, guitars, banjos, or brass instruments—may provide background music.

Many gospel songs have parts known as call and response. In this type of singing, the leader sings a phrase and then the group responds with a repeated line.

Many gospel singers are very expressive when they sing.

The roots of gospel music can be traced back to African slaves in North America in the 1700s. At that time slave owners made slaves attend church services. At these services the slaves learned Christian hymns. They made up work songs and religious songs, called spirituals, based on these hymns.

After the end of slavery African American preachers used music during their sermons. During the early 1900s recordings of these sermons became available. In this way gospel music spread to a wider audience. Popular singers began using the forms and sound of gospel music. In turn, popular music, such as the blues, also influenced gospel music. Some of the best-known gospel singers and songwriters were Thomas A. Dorsey, C.A. Tindley, C.L. Franklin, and Mahalia Jackson.

Gourd

Gourds are hard-shelled fruits. They are generally used as decorations or in crafts. Gourds come in a wide variety of shapes and are often very colorful. They are related to pumpkins, squashes, cucumbers, and melons.

Gourds first grew in the Americas and in tropical Africa and Asia. They were among the first plants grown by people. Today gourds are grown throughout the world in the tropics and in mild areas.

Colorful gourds are often used as decorations.

Gourds grow on vine plants. The vines are sticky and covered with rough, prickly hairs. The leaves are large, and the flowers are white or yellow. The smallest gourds are the size of a marble. The largest are more than 7 feet (2 meters) long. Some gourds are white, but many others have bands, stripes, or spots in shades of yellow and green. Some have smooth skin, while others have bumps or spines.

In some countries people eat gourds. But mostly people use gourds to make musical instruments, pipes, masks, and containers such as water jugs. The inside of one type of gourd is dried and used as a sponge called a loofah.

Government

The government of a modern nation, or country, is an organization that does many things. It defends the country from outside enemies. It keeps order within the

country. And it does services for its people. In return, the people of the country must pay money called taxes to the government. They also must obey the government's rules, which are called laws. States and cities have governments, too.

Powers of Government

There are three kinds of government power: legislative, executive, and judicial. The legislative branch of the government makes laws. The executive branch enforces the laws and runs most government departments. The judicial part settles disagreements about the law and runs the courts.

Forms of Government

Governments can be set up in many ways. Most modern governments fit into a few types.

Democracy

Democracy is government of the people, by the people, and for the people. In direct democracy all citizens vote on everything. Direct democracy works best in places where there are few people. Modern democratic countries have representative democracy instead. In a representative democracy citizens vote for representatives to make decisions for them.

In a democracy people are free to start and join political parties. Parties are groups of people who agree with each other on political issues.

Most modern democracies have constitutions. A constitution is a document

Did You Know?

The word government comes from a Greek word meaning "to pilot a ship."

Two justices (high-level judges) of the Navajo Supreme Court hear a case. The court is a part of the judicial branch of the government of the Navajo people.

that organizes the government and sets limits on its power. The two main types of constitutional democracy are the presidential system and the parliamentary system.

Presidential System

The presidential system is common in republics (countries with no king or queen), including the United States. In a presidential system the executive and legislative branches are separate. The people elect representatives for a legislature, or lawmaking body. They also elect a president to be the head of the executive branch. The president is not allowed to be a member of the legislature.

Parliamentary System

The United Kingdom and many of its former colonies have a parliamentary system. In a parliamentary system, the legislative and executive branches of government are not separate. The people elect members of a legislature, called a

parliament. But they do not elect the head of the executive branch, called the prime minister. The prime minister is a member of the parliament. Usually, the prime minister is the leader of the political party with the most members in the parliament.

Monarchy

Hundreds of years ago almost all countries were monarchies. A monarch is a king or a queen. Monarchs are not elected. They inherit their titles from their families.

In the kind of monarchy called an absolute monarchy, the monarch has unlimited power. A few absolute monarchies still exist. But most modern monarchies, including the United Kingdom, are limited, or constitutional, monarchies. In a constitutional monarchy the monarch has little or no power. An elected parliament and a prime minister run the country. This is why constitutional monarchies also count as democracies.

Students outside the Arkansas Capitol protest a proposed change to Arkansas's constitution. A constitution is a document that explains how a government works.

Dictatorship

Some countries have a ruler who is not a king but still has unlimited power. Such a person is called a dictator. Many dictators take power by force. Some call themselves the president. Others are generals in the army. Only the dictator's political party is allowed to exist.

Levels of Government

People in modern countries live under several levels of government at the same time. For example, most people in the United States live in a city or village, a county, and a state. In general, national governments fit together with lower levels of government in two different ways. They are called the unitary system and the federal system.

Most of the world's countries, including the United Kingdom, France, and Japan, have a unitary political system. In such a system the national government supervises local governments. Some unitary governments allow local areas to elect some of their leaders. In others the national government chooses local leaders.

A federal political system is found in other countries, including Argentina, Australia, Brazil, Canada, India, Russia, and the United States. In a federal system the national government shares power with local governments. Local governments elect their own leaders and make their own laws, as long as they do not go against national law. Federal systems are found most often in large countries.

Each of the 50 U.S. states has its own government. The legislative or lawmaking branch meets in the state's Capitol.

World Government

Throughout history disputes between countries have often led to wars. In the 1900s countries of the world began to work together to settle disputes peacefully instead. These efforts led to the United Nations (UN). The organization was formed in 1945 after the end of World War II.

The majority of the countries of the world belong to the UN. The UN is not considered a world government because it does not create and enforce laws for individual people to follow. However, because the UN attempts to set rules for all the countries of the world, it could be described as a government of governments.

Graham, Martha

As a dancer and choreographer (creator of dances), Martha Graham had a powerful influence on modern dance. She rejected traditional graceful styles of dancing and used forceful movements that expressed strong emotions.

Graham was born near Pittsburgh, Pennsylvania, on May 11, 1894. She moved to California with her family in 1908. As a teenager she studied at the Denishawn dance school, where she learned dance styles from around the world. She later became a member of the Denishawn dance company. Her great dramatic power made her a favorite with audiences.

In 1923 Graham went to New York, where she danced and later taught dance. In 1926 she formed a dance company. Not all her early pieces were immediately successful. They were

unlike dances that audiences were used to seeing and were set to unfamiliar modern music. Graham later won wide praise for her works. Among them were *Appalachian Spring* (1944), which was about American frontier life.

In the late 1920s Graham founded a dance school, where she developed a distinctive dance technique. Important dancers who studied with Graham include Merce Cunningham, Paul Taylor, Twyla Tharp, and Alvin Ailey.

Graham did not retire from dancing until she was 75. She continued to choreograph until she died, on April 1, 1991, in New York City. She created 181 dance works in all. The dance technique she developed is still taught at many dance schools.

Grain

Grains are types of grass that produce seeds that can be eaten. Grains are also called cereals. Wheat, rice, and corn are the most commonly grown grains. Other important grains include barley, oats, rye, millet, and sorghum.

A grain seed has three parts: the bran, the germ (or embryo), and the endosperm. The bran is the outer layer. It protects the inside of the grain. The germ is the part of the grain that can grow into a new plant. The endosperm provides food for the germ. A grain described as “whole” has all three parts.

A woman in Nigeria pours grains of millet into a bowl. Uneatable pieces are lighter and blow away.

Processed, or refined, grains usually have had the bran and the germ removed. Whole grains have more nutrients than refined grains.

People eat grains in a number of ways. They eat rice and corn on their own. They also eat grains as ingredients of other foods, such as breakfast cereals and soups. Grains are also eaten in the form of flour. Flour is made by crushing grains into tiny pieces. The grain most commonly used to make flour is wheat. People use flour to make bread, cookies, crackers, cakes, and pastas.

Baskets hold grains for sale at a market.

Grains have other uses, too. Farmers use grains to feed farm animals. They use straw, or the stalks of grain plants, as bedding for animals. People also use grains in industry. Grains are used to make oils, alcohols, and other products.

Grammar

Grammar is a set of rules that tells how a language works. Every language has its own set of rules. The rules of grammar explain what different kinds of words do and how they work together.

Types of Words

In English, there are nine basic types of words. These types are called parts of speech. The parts of speech are nouns, articles, pronouns, verbs, adjectives, adverbs, prepositions, conjunctions, and interjections.

How Words Work Together

In English, grammar mainly involves the order of words. The meaning of a sentence changes if the word order changes. Here are two sentences: The car hit the tree. The tree hit the car. These two sentences have the same words. But because the word order is different, the meaning is different.

The word order also decides whether the sentence makes sense. In English, the subject, or main noun, of a sentence usually comes before the verb. For

Did You Know?

Many people think that it is important for children to learn grammar. U.S. elementary schools used to be called grammar schools.

Grammar		
Part of Speech	What It Does	Examples
noun	stands for people, places, or things	teacher school book
article	tells whether a noun is specific or general	the (specific) a (general)
pronoun	replaces a noun	she it they
verb	tells what a noun or a pronoun does	talk read
adjective	describes a noun or a pronoun	smart large funny
adverb	describes a verb, an adjective, or another adverb	happily always
preposition	tells how words in a sentence relate to one another in time or space	to with
conjunction	combines parts of a sentence, or whole sentences, into one sentence	and but or
interjection	shows emotion	oh yuck

example, “Ran quickly the girl” does not make sense because the subject (the girl) comes after the verb (ran). Other languages have different rules about word order.

Grand Canyon

Noted for its fantastic shapes and colors, the Grand Canyon is one of the most

spectacular sights in the United States. The vast canyon was cut through many layers of rock by the muddy waters of the Colorado River. It runs for 277 miles (446 kilometers) through north-western Arizona, ranging from about 0.1 to 18 miles (0.2 to 29 kilometers) wide. In places the canyon is more than a mile (1.6 kilometers) deep.

Some of the rocks in the Grand Canyon are 4 billion years old. The Colorado River began eroding, or wearing down, the rocks about 6 million years ago. Wind and rain have helped the erosion process. Some of the rock towers that rise from the depths of the canyon look like castles and temples. The canyon is mostly red, but different layers of rock are buff, gray, green, pink, and violet.

Willow trees and cottonwoods grow at the bottom of the canyon where there is plenty of water. There are magnificent forests of pine, fir, spruce, and aspen on the canyon’s north rim. Cacti are common in drier areas. Wildlife includes coyotes, foxes, deer, badgers, pumas,

The Grand Canyon’s unique beauty attracts millions of visitors each year.

bobcats, rabbits, squirrels, and chipmunks.

Grand Canyon National Park was created in 1919 and enlarged in 1975. A paved road and a trail connect the north and south rims of the canyon. Mule-pack trips and river rafting are popular ways of exploring the canyon.

Grant, Ulysses S.

Ulysses S. Grant became the 18th president of the United States in 1869. A few years earlier Grant had led the Union armies to victory in the American Civil War. He was less successful as a president than as a general.

Early Life

Hiram Ulysses Grant was born in Point Pleasant, Ohio, on April 27, 1822. His parents were Jesse Root Grant, a tanner and a farmer, and Hannah Simpson. At age 17 Grant entered the U.S. Military Academy at West Point, New York. By mistake, the academy recorded his name as Ulysses S. Grant. After graduating in 1843, Grant kept the new name.

From 1846 to 1848 Grant fought in almost every battle of the Mexican War. He then married Julia Boggs Dent, with whom he had four children. In 1852 Grant took an assignment on the Pacific coast. Homesick, he soon resigned from the Army and settled

Ulysses S. Grant was the 18th president of the United States.

with his family near Saint Louis, Missouri. After failing at farming, he joined his brothers in their leather business in Galena, Illinois.

Civil War

At the start of the Civil War in 1861, Grant gathered and trained troops for the Union. In 1862 he and his forces won the first major Union victory of the war at Fort Donelson in Tennessee. After that battle Grant earned the rank of major general.

In 1863 Grant led Union victories at Vicksburg, Mississippi, and Chattanooga, Tennessee. The next year he gained command of all the Union armies. Grant accepted the surrender of Confederate general Robert E. Lee in Virginia in 1865. After the war Grant became a general, the highest rank in the Army.

Presidency

In 1868 the Republican Party nominated Grant for president. He defeated his Democratic opponent, Horatio Seymour, and took office in March 1869. He was reelected in 1872.

President Grant faced serious problems resulting from the Civil War. He favored harsh policies against the defeated Southern states. He also supported civil rights for former slaves. Grant worked for the 15th Amendment to the Constitution, which gave African Americans the right to vote.

Grant's popularity fell in his second term because of political scandals. The public learned that important Republican politicians had made illegal business deals.

Retirement

After leaving office in 1877, Grant toured Europe and Asia and then moved to New York City. In the 1880s he lost

most of his money in a failed business. To support his family he began to write the story of his life. Grant finished his book about a week before his death from cancer on July 23, 1885.

Fruit

Grapefruit

The grapefruit is a tart, juicy citrus fruit that grows on trees. It is a good source of vitamin C. It is called grapefruit because it grows in clusters like grapes do. The scientific name of the grapefruit tree is *Citrus paradisi*.

The United States is one of the world's leading grapefruit producers. Grapefruit are grown mainly in the warm, sandy soils of Florida, Texas, Arizona, and California. Other major grapefruit producers include Israel, Mexico, Cuba, and South Africa.

The grapefruit tree has spreading branches, thorny twigs, and dark, shiny green leaves. It grows about 25 feet (7.6 meters) tall in orchards, but it can be larger. It has large, sweet-smelling white flowers.

The fruit is round and measures 4 to 6 inches (10 to 15 centimeters) across. It has a lemon-yellow rind, or outside covering, when it is ready to be picked. The

Grapefruit grow in clusters on trees with shiny, green leaves.

pulp, or soft inside, is light yellow, pink, or red. The pulp has about 10 to 14 sections. Each section is surrounded by a bitter skin and may include seeds.

Grapefruit are picked by hand or harvested with a machine that shakes the tree's limbs. They are usually eaten fresh. The juice is sold fresh, frozen, or canned.

Graph

Graphs are drawings that show mathematical information with lines, shapes, and colors. Graphs are also known as charts. People use graphs to compare amounts of things or other numbers. Graphs are useful because they can be easier to understand than numbers and words alone.

There are many different kinds of graphs. Some of the most common kinds are circle graphs, bar graphs, and line graphs.

Circle Graphs

Circle graphs are also called pie graphs because they look like a pie divided into wedges. Circle graphs show amounts of different things as small or large sections of the circle. For example, a circle graph

could show that three quarters of the students in a classroom play video games. The whole circle would represent all the students. Three quarters of the circle would be one color, to represent the video-game players. The remaining quarter of the circle would be another color, to represent the students who do not play.

Bar Graphs

A bar graph shows amounts as bars of different sizes and, sometimes, of different colors. Longer bars represent larger numbers. For example, a bar graph could show that one classroom had 30 students and another classroom had 15 students. Two bars would represent the different classrooms. The bar for the classroom with 30 students would be twice as long as the bar for the classroom with 15 students.

Line Graphs

A line graph uses dots connected by lines to show how amounts change over time. For example, a line graph could show the highest temperature for each month during one year. One side of the graph would show a range of temperatures. The bottom of the graph

would show the months. A dot over each month would represent the highest temperature for that month. Each dot would line up with the correct temperature on the side of the graph. A line connecting the dots would show how temperatures rose and fell over the year.

Grass

Grasses are a family of plants with leaves that usually look like blades. Most of them also have hollow stems and many branching roots. The green grass found in yards, the grasses growing on open land, grains, and bamboos all belong to the grass family.

Where Grasses Grow

Grasses grow almost everywhere on Earth because they can survive in many different climates. Large areas of wild grass are called grasslands.

Physical Features

Some grasses, such as bluegrass, are very short. Others, such as giant bamboos, grow as tall as 100 feet (30 meters). Most grasses are soft and bendable, but bamboos are harder, woody grasses.

In tropical regions grass leaves are broad. Desert grasses have spiky leaves that help keep moisture inside. The leaves of some water grasses are waxy. The waxiness protects them from the water.

Uses

Since ancient times people have eaten the seeds of many grasses. These grasses, called grains or cereals, include corn, barley, millet, oats, rice, rye, sorghum, and wheat. Livestock, or farm animals that are raised by people, also eat grains. Both livestock and wild animals graze on wild grasses.

After people take the seeds from cereals, the stalks of the plants are left. When dried, these stalks are called straw. Farmers cover the floors of barns with straw.

The green grass in Central Park helps New York City look nice and is also good for the environment.

People in some parts of the world use straw to build roofs. People also weave straw to make furniture, mats, baskets, and hats.

People grow grass lawns because grass makes a yard look green and attractive. But grasses are also important to the environment. Grass roots spread in all directions. These roots prevent erosion, or the loss of soil, by holding the soil in place.

Bamboo • Grain • Grassland

Grasshopper

Grasshoppers are leaping insects that are found all over the world. They live mostly in forests or grasslands, but they are also common in gardens. Their brown or green coloring helps them blend in with the plants and dirt around them. Grasshoppers are closely related to crickets.

Compared to many other insects, grasshoppers are large. Some are more than 4

inches (11 centimeters) long. Grasshoppers have long hind legs that are good for jumping. They have antennas, or feelers, on their heads that they use to touch and smell. They also have special eyes that allow them to see in all directions at once.

Most grasshoppers eat only plants. Some kinds, such as locusts, move in swarms and destroy farmers' crops.

Usually only male grasshoppers chirp or sing. They make their song by rubbing their wings together or by rubbing their hind legs against their front wings. The song is the male's way of calling females.

Cricket • Insect • Locust

Grassland

Grasses grow in wide, open spaces around the world. Large areas covered with grasses are called grasslands. Tropical grasslands grow close to the equator. Temperate grasslands grow in regions farther from the equator.

Features

Many different kinds of grass grow on the world's grasslands. Grasslands may have no trees or only a scattered few. Usually the land is flat. Sometimes it has rolling hills.

Grasslands are good for grazing livestock. Grasslands also have good soil for farming. Wheat, oats, corn, and other crops have replaced many wild grasses.

Grasshoppers use their long hind legs for jumping.

Types of Grasslands

Tropical grasslands are often called savannas. Africa, India, Southeast Asia, Brazil, and Australia all have areas of tropical grassland. The climate of savannas is extreme. Temperatures are high, and there are wet and dry seasons.

The climate in temperate grasslands is less extreme. The prairies of North America are temperate grasslands. So are the pampas of Argentina, the veld of southern Africa, and the steppes of central Asia. The huge rangelands in Australia's southeastern corner are also temperate grasslands.

Life in the Grasslands

The large animals that live in tropical grasslands include zebras, gazelles, lions, and kangaroos. Horses, antelope, hawks, and prairie dogs are a few of the animals that live in temperate grasslands.

In the past wandering peoples lived on many of the world's grasslands. For example, the Mongols lived on the steppes of central Asia. The Plains Indians lived on the prairies of North America.

The grasslands in central North America are called prairies.

Changing Grasslands

In the 1800s farmers moved onto the grasslands of southern Africa, Australia, South America, and North America. They began changing the grasslands into farmland. In North America the prairies once extended down the middle of the continent, from Canada to Texas. Now most of this land is farmland. The Australian grasslands and the South American pampas have also become mostly farming and grazing lands. Grasslands have also disappeared as cities and towns have expanded.

But much grassland still exists. The veld still carpets large parts of southern Africa. Steppes extend 5,000 miles (8,000 kilometers) from eastern Europe to eastern China. They are mostly unspoiled wilderness, and few people live there.

Grass

The sun sets on a savanna in the African country of Kenya.

Gravity

All objects attract other objects because of a force called gravity. Gravity is a pulling force that works across space. That is, objects do not have to touch each other for the force of gravity to affect them. For example, the sun, which is millions of miles from Earth, pulls on Earth and the other planets and objects in the solar system.

Gravity on Earth

On Earth gravity pulls objects toward the center of Earth. This is what makes objects fall. It is also what gives an object weight. Weight is a measurement of the force of gravity between an object and the surface it stands on. If a person stands on a scale, gravity pulls the person against the scale. The scale shows the strength of this force, or the person's weight.

Gravity is what gives weight to objects on Earth. Scales measure the pull of gravity as weight.

Gravity keeps the Moon moving in an orbit around Earth.

Gravity in Space

In the solar system the planets all orbit, or travel around, the sun in a constant path. They would move in a straight line, but the force of gravity pulls them toward the sun. At the same time, the speed of the planets in their orbits keeps them from falling into the sun.

Spacecraft and satellites travel around Earth in a similar way. Earth's gravity keeps them in orbit, and their speed keeps them from falling back to Earth.

When astronauts are inside a spacecraft in orbit, they experience weightlessness. The astronauts float freely because they are traveling around Earth at the same speed as the spacecraft. But even though Earth's gravity does not pull them toward the floor—as it does on Earth—they have not escaped it. Earth's gravity

keeps the astronauts in orbit, just as it does the spacecraft.

Newton's Law of Gravity

Isaac Newton, an English scientist, discovered a law, or truth, about gravity in the late 1600s. Newton said that the force of gravity between objects depends on their mass, or the amount of material they contain. The greater the mass of an object, the greater is its force of gravity. For example, the sun, which has a very large mass, has a greater force of gravity than Earth, which has a much smaller mass. Even a speck of dust has a force of gravity. But its gravity is very, very small.

The force of gravity also depends on the distance between two objects. The smaller the distance, the greater is the force of gravity between them.

Great Barrier Reef

The Great Barrier Reef is the largest coral reef on Earth. A barrier reef is a long, narrow coral formation that lies parallel to the shoreline of a landmass and is mostly underwater. The Great Barrier Reef is in the Coral Sea, off the northeastern coast of Australia. It extends 1,250 miles (2,000 kilometers) from north to south.

The Great Barrier Reef is a tourist attraction and a protected marine environment. The sea life of the reef is

Colorful corals and fish help to create the striking beauty of the Great Barrier Reef.

extraordinary. The reef has been formed over millions of years from the skeletons of millions of tiny corals. There are at least 300 types of hard coral on the Great Barrier Reef. Other animals include sponges, anemones, worms, snails, lobsters, crayfish, prawns, jellyfish, and giant clams. Certain algae give the reef a purplish red rim. There are also hundreds of different birds in the area and more than 1,500 types of fish, many with brilliant colors and unusual shapes.

Great Depression

During the 1930s much of the world faced harsh economic conditions. Many people were out of work, hungry, or homeless. This period is called the Great Depression. It started in the United States, but it quickly spread throughout the world.

Effects in the United States

During the 1920s many people invested their money in stocks (shares of ownership in companies). For a few years the value of stocks rose rapidly. In September 1929, however, stock prices began to fall. On October 29 they “crashed.” This meant that people’s stocks were now worth almost nothing. This day became known as Black Tuesday.

Many people lost all the money they had. Banks were hurt as well. People who had borrowed money from banks were unable to pay it back. Many banks failed because crowds of people tried to take out all their money at once. When a bank failed, people with accounts there lost their savings. In addition, factories and businesses closed because not enough people were able to buy the goods they produced or sold.

By 1932 about 12 to 13 million people were out of work. People with jobs were paid only about half of what they had earned before. Dry weather in the Great Plains made things even worse for farmers. They could not grow enough crops to sell. The land was so dry that it was called the Dust Bowl.

Effects Around the World

The situation in the United States affected countries all over the world. The United States could no longer lend as much money or trade as many goods

Women serve soup and bread to the unemployed during the Great Depression.

with other countries. Great Britain, Germany, and other countries suffered from the loss of U.S. loans and trade.

End of the Great Depression

In the United States angry voters turned President Herbert Hoover out of office in 1932. The new president, Franklin D. Roosevelt, had a program that he called the New Deal. The New Deal put some people back to work right away. It also changed the financial (banking and money) system to prevent the same problems from happening in the future.

The Great Depression ended in the United States only after the country entered World War II in 1941. Factories began to produce weapons, airplanes, ships, and other products necessary for the war effort. Many people were then able to get jobs.

Great Lakes

The Great Lakes are five large lakes in eastern North America. They are Lakes Superior, Michigan, Huron, Erie, and Ontario. Together the Great Lakes cover an area of about 94,850 square miles (245,660 square kilometers). They form the largest connected area of freshwater on Earth.

Lake Michigan is the only one of the Great Lakes that is completely within the United States. The other four form a natural border between Canada and the

United States. Lake Superior is the largest and the deepest of the Great Lakes. Lake Ontario is the smallest. Lake Erie is the shallowest. Lake Huron has the longest shoreline.

The Great Lakes affect the climate of the surrounding land. They absorb a lot of heat in the summer. In the winter they release heat into the air. As a result, the land closest to the lakes has cooler summers and warmer winters than areas farther inland. Large parts of the lakes freeze during winter.

The Great Lakes are important to the economy of North America. Major cities in the region include Milwaukee, Wis-

consin; Chicago, Illinois; Cleveland, Ohio; Detroit, Michigan; and Toronto, Ontario. ships carry iron ore, coal, grain, and manufactured goods to and from the cities. The Saint Lawrence Seaway connects the Great Lakes with the Atlantic Ocean. The lakes also supply water to nearby cities.

Fishing was once a major industry on the lakes. However, pollution and other factors led to its collapse. Today only some commercial fishing takes place. Sport fishing is more common.

The Great Lakes are popular recreation areas. Powerboating and sailing are popular. Many beaches stretch along the shores.

Great Victoria Desert

The huge Great Victoria Desert stretches across southern Australia. It lies in the states of Western Australia and South Australia. Sand dunes cover much of the desert. In some places a layer of tightly packed pebbles covers the ground.

Summers in the Great Victoria Desert are very hot. Winters are cooler, and nighttime temperatures may drop below freezing.

Scattered eucalyptus and acacia trees, shrubs, and grasses grow in the desert. Skinks, geckos, monitor lizards, copperhead snakes, and other reptiles live there. Mice, dingoes, and foxes also make their home in the desert.

Few people live in the Great Victoria Desert. The government of Australia uses parts of the desert for weapons testing. Some Aboriginal people live in the eastern regions. There are also several national parks in the desert.

Great Wall of China

The Great Wall of China winds across the Chinese countryside for more than 4,000 miles (6,500 kilometers). It is one of the biggest structures ever made by humans. The ancient Chinese built the wall to protect against invading armies. Today it is a tourist attraction and a symbol of China.

The Great Wall of China winds through a hilly area.

The Great Wall is made of dirt, stone, and brick. Its height ranges from 15 to 30 feet (5 to 9 meters), and its width is 15 to 25 feet (5 to 8 meters). Many watchtowers rise above the wall, and a roadway runs along the top.

Workers began constructing the Great Wall in the 600s BC. It was built in several sections. In the 200s BC the Chinese joined the sections together. The Chinese stopped using the wall for protection in the 1600s. The wall fell into ruin, but in the 1900s parts of it were rebuilt.

Great Zimbabwe

Great Zimbabwe was a city at the heart of an African trading empire from about

1100 to 1500. Ruins of the city can still be seen in what is now the country of Zimbabwe in southern Africa.

The people of Great Zimbabwe were part of a group called the Shona. The Shona are Bantu-speaking peoples who still live in Zimbabwe. They farmed and raised cattle. They made pottery, sculpture, and

A hut has been built close to the ruins of the Great Zimbabwe city.

bone tools. However, they are best known as traders of gold. They traded along the coast of the Indian Ocean.

People stopped living in Great Zimbabwe before 1500. They left behind stone and brick buildings that archaeologists study today.

The oldest part of the city was built on a hill. Archaeologists call it the Hill Complex. It may have been a religious center. Its walls are up to 20 feet (6 meters) thick and 36 feet (11 meters) high. They were built partly with odd-shaped rocks and partly with blocks of cut stone.

South of the Hill Complex is something known as the Great Enclosure. The outer wall is about 820 feet (250 meters) around. It rises 36 feet (11 meters) at its highest point. The Great Enclosure was the largest structure in ancient Africa south of the Sahara. Archaeologists do not know what it was used for.

Greco, El

Paintings by El Greco are known for their brilliant colors and strong contrasts of light and shadow. El Greco also stretched out the figures in his paintings. Their bodies and limbs are unusually long, thin, and muscular. Although El Greco was Greek, he lived much of his life in Spain, where he became the first great master of Spanish painting.

El Greco was born in 1541 in Candia (now Iráklion), on Crete, an island south of Greece. His original name was Doménikos Theotokópoulos. Not much is known about his early life. In the 1560s he traveled to Italy, where he studied the painting style of Italian artists of the period. While in Italy he acquired the nickname El Greco, which means “The Greek.”

El Greco painted Saint John the Evangelist. El Greco often used secondary colors—green, purple, and orange—in his paintings.

El Greco left Italy for Spain in the late 1570s. He settled in Toledo, Spain, which was then a religious and cultural center. He created many religious paintings for the city’s Roman Catholic churches and monasteries as well as for private clients. El Greco died in Toledo on April 7, 1614. He remains one of the world’s most admired painters.

Painting

Greece

In ancient times Greece was a center of science, philosophy, and art. In the 1900s the country experienced wars and changes of government. Today Greece has become an important member of the European Union. The capital and largest city is Athens.

Geography

Located in southeastern Europe, Greece includes a mainland and about 2,000 islands. The Greek mainland shares borders with Albania, Macedonia, Bulgaria, and Turkey. The Ionian, Mediterranean, and Aegean seas surround all of Greece.

About 80 percent of Greece consists of mountains. The Pindus Mountains run north and south on the mainland. Greece's highest peak, Mount Olympus, is in the east; it rises to 9,570 feet (2,917 meters). Summers are hot and dry, and winters are mild and rainy. Earthquakes are common.

Plants and Animals

About one fourth of Greece is forested. The northern mountains have forests of chestnut, ash, and beech trees. Firs and pines grow on the upper slopes. Other plant life includes evergreen oak and cypress trees, as well as juniper, myrtle, and oleander shrubs.

Bears, wolves, wildcats, martens, wild boars, lynx, and deer live in the mountain forests. Jackals, wild goats, and porcupines live in the south.

Greece's birds include herons, storks, and pelicans.

People

Ethnic Greeks make up more than 90 percent of the population. There are small numbers of Macedonians, Albanians, Turks, and others, but the Greek government does not view them as separate groups. Nearly all people speak modern Greek, a language similar to ancient Greek. Most Greeks belong to the Greek Orthodox church, which is a branch of Christianity. Muslims form a small religious minority. More than half of the population lives in cities.

Economy

Services—including tourism, shipping, and banking—are the main economic activities. Each year, Greece's natural beauty and ancient ruins draw more than 10 million tourists.

Manufacturing is also important to the economy. Factories produce food and beverages, chemicals, machinery, clothing, petroleum products, and other goods. Mines provide bauxite, the raw material for making aluminum. Greece also has high-technology and telecommunications industries.

Agriculture forms a smaller part of the economy. However, Greece is known for making wine and olive oil from its grapes and olives. The grapes and olives, as well as oranges and lemons, grow in the warm coastal regions. Other crops include sugar beets, wheat, corn, tomatoes, cotton, and tobacco. The mountain regions are used mainly for herding sheep and goats. The

fishing industry also provides food for Greece.

History

Greece became part of the Byzantine Empire in the late 300s. (For the early history of Greece, read the article *Greece, Ancient*.) In 1453 the Turkish Ottoman Empire conquered Greece, along with the rest of the Byzantine Empire. The Greeks often revolted against Turkish rule. In 1821 they began a war of independence. Supported by Great Britain, France, and Russia, Greece declared its independence in 1829.

Unification

The new state did not include all of the territory of ancient Greece. During the 1800s and early 1900s Greece regained control over much of its historic land. In 1912–13 Greece fought alongside Serbia, Bulgaria, and Montenegro in the First Balkan War against Turkey. In 1913 Greece joined Serbia in the Second Balkan War against Bulgaria. As a result of the Balkan Wars, Greece regained control over Crete and much territory on the mainland.

Wars with Turkey

In 1917 Greece entered World War I on the side of the Allies. Turkey sided with the Germans. Fighting between Greece and Turkey continued long after the end of World War I in 1918. By 1919 Greece had won significant territory from Turkey, including the city of Smyrna. In 1921–22 Greece and Turkey fought another war. Turkey easily

defeated Greece and reclaimed much of the land that Greece had taken.

World War II and Civil War

In 1941, during World War II, Nazi Germany invaded Greece. The German army withdrew from Greece in 1944.

After World War II, civil war broke out in Greece between Communist and anti-Communist forces. Many Greeks supported the Communists, who had played a leading role in the war against Germany. Worried by the spread of Communism, the United States and Britain supported the anti-Communist forces. The anti-Communists won the war in 1949.

Postwar Greece

After the war, political problems made rebuilding difficult. In 1967 a group of army officers seized control of the country. The military government remained in power until 1974, when a democratic government was elected.

Greek women perform a folk dance.

That year Greece and Turkey nearly fought a war over control of the island of Cyprus.

During the late 20th and early 21st centuries Greece worked to improve relations with its neighbors. Athens hosted the Summer Olympics in 2004.

Greece, Ancient

The area that is now Greece was home to the first civilizations in Europe.

Ancient Greece had powerful cities, great thinkers called philosophers, and fine art. The idea of democracy—rule by the people—also came from ancient Greece.

Aegean Civilizations

Greek civilization began sometime after 3000 BC on the island of Crete. Crete lies south of Greece, on the southern border of the Aegean Sea. This first civilization is called the Minoan civilization.

In the 1500s BC Greek-speaking people developed another civilization on the Greek mainland. This civilization was called the Mycenaean civilization. The Mycenaeans conquered the Minoan capital between 1500 and 1400 BC. In about 1200 BC they probably fought a war against Troy, a city in Asia Minor (modern Turkey). Many Greek legends tell of this war, called the Trojan War.

Many remains from ancient Greece are still standing today. Three columns remain from a temple called the Tholos at Delphi. The temple was built in the early 300s BC.

Two great poems from ancient Greece tell of Mycenaean times. The poems, the *Iliad* and the *Odyssey*, were said to be the works of a man named Homer.

In about 1100 BC the Dorians, a people from the north, invaded. Mycenaean civilization came to an end. Many Mycenaeans moved across the Aegean Sea. They settled in Ionia in Asia Minor.

Greek Cities

The Dorians settled mostly in the western sections of Greece. The people in the eastern parts became known as Ionians. Together, the Dorians and the Ionians formed the civilization known as classical, or ancient, Greece. They built cities in most of what is now Greece.

By 800 BC the Greeks were building cities in new lands, too. Some went east to the Black Sea. Others settled in the west, on the island of Sicily and the mainland of Italy.

Most of the classical Greek cities, called city-states, were independent of each other. Athens and Sparta grew to be the most important city-states. Athens spread its influence by uniting all the surrounding villages. By contrast, Sparta sent armies to make slaves of its neighbors. By the 500s BC Sparta had the strongest army in Greece.

The Hellenes

Despite their differences, the Greeks came to think of themselves as one people. They called themselves the Hellenes.

The Hellenes shared a similar culture and spoke forms of the Greek language. They even invented the word barbarian to describe anyone who did not speak Greek.

The ancient Greeks believed in many gods. They pictured their gods as larger, more beautiful, and more powerful humans. These gods were said to live on Mount Olympus in northern Greece.

People often gathered together for festivals in ancient Greece. The most famous festival was the original Olympic Games, which began in about 776 BC.

Democracy and Culture in Athens

Powerful leaders ruled most of the city-states. Eventually, Athens took the first steps toward democracy. In 621 BC a ruler named Draco drew up a written code of laws. Then, in the last years of the 500s BC, another leader set up a

democratic government. All free men with Athenian parents were members of the city's lawmaking group. However, women, foreigners, and slaves were not included.

Athens also became the Greek center of literature and the arts. The philosophers Socrates, Plato, and Aristotle were great teachers there. Poets and playwrights wrote works that are still read and performed today. Painted pottery became a fine art and a great industry. Athenians built beautiful buildings and sculptures out of marble.

The Persian Wars

In the 500s BC the empire of Persia (modern Iran) took over the Greek cities in Ionia. In about 499 BC the city of Miletus started a rebellion against the Persians. Athens sent 20 ships to aid the Ionian Greeks, but the Persians crushed the revolt.

An ancient Greek mosaic shows the sea god Poseidon riding two dolphins. The mosaic was made from many small, flat colored stones.

Beginning in 490 BC the Persians attacked the Greek mainland several times. The Greeks fought back and finally defeated the Persians in 479 BC. After the Greek victory, Athens grew stronger.

The Peloponnesian War

By the 400s BC Athens controlled most of eastern Greece, many of the Aegean islands, and the Ionian coast in Asia Minor. The Spartans thought that Athens was too powerful. They began the Peloponnesian War against Athens in 431 BC.

At first, the Athenians avoided battle on land. They stayed within the walls of their city. Their navy attacked Sparta from the sea. The Athenians stayed safe until 430 BC, when plague (a deadly disease) broke out in the city. The disease killed one quarter of the people, including Pericles, their leader.

Sparta won the war in 404 BC. Sparta kept a leading position for only 30 years, however. In 371 BC another Greek city, called Thebes, defeated Sparta.

Rise of Macedonia

In the 300s BC Macedonia, a kingdom to the north, gained strength. The Macedonians were distantly related to the Greeks. The Macedonian king Philip II conquered the Greek city-states by 338 BC. When he died in 336, his son Alexander came to power.

Alexander, called Alexander the Great, was a military genius. First he defeated the Persian king Darius III in 333 BC.

Then he spent a decade conquering lands from Egypt to India. He took Greek civilization to much of the ancient world.

The Hellenistic Age

A sculpture from about 320 BC shows a young woman of the Hellenistic Age of ancient Greece.

Alexander died in 323 BC. The period following his death is called the Hellenistic Age. “Hellenistic” means “Greek-like.”

Alexander’s empire broke into three main kingdoms in Macedonia, Egypt, and the Middle East. In these kingdoms, Greek culture mixed with local cultures. In Greece itself, some of the cities regained their independence or joined together in leagues.

Ancient Rome conquered all of Greece and the three Hellenistic kingdoms by 30 BC. Greece remained under the

Greenhouse Effect

The greenhouse effect is a warming of Earth's surface and the air above it. It is caused by gases in the air that trap energy from the sun. These heat-

Energy from the sun heats Earth's surface and atmosphere. Greenhouse gases keep much of this heat from reflecting back into space.

trapping gases are called greenhouse gases. The most common greenhouse gases are water vapor, carbon dioxide, and methane. Without the greenhouse effect, Earth would be too cold for life to exist.

Land, oceans, and plants absorb, or soak up, energy from sunlight. They release some of this energy as heat. Greenhouse gases absorb the heat and then send it back toward Earth. Without greenhouse gases, this heat would escape back into space.

Scientists believe that human activities are increasing the greenhouse effect. When people drive a car or operate a factory they burn coal, oil, and other fossil fuels. This adds extra greenhouse gases to the air, and the extra gases trap more heat. Many scientists think that this has led to global warming, or a steady rise in the average temperature of Earth's surface.

Greenland

Greenland is the world's largest island. It lies in the very cold northern part of the world. Greenland belongs to Denmark. The capital and largest town is Nuuk.

Geography

Greenland is in the northern Atlantic Ocean. The northern tip is less than 500 miles (800 kilometers) from the North Pole. A massive ice sheet, or glacier, cov-

Did You Know?

Greenland never was very green. Erik the Red gave that name to the island because he wanted people to move there.

ers most of Greenland. At its deepest point the ice is 10,000 feet (3,000 meters) thick. Mountains run along the island's east and west coasts. The coast-line is indented in many places by narrow strips of sea, which are called fjords.

People

The people of Greenland are mostly of Inuit (Eskimo) origin. Many of them also have some European roots. Most of the rest of the people are Danish (from

Denmark). The main languages are Greenlandic (an Inuit language), Danish, and English. Almost everyone lives in small towns along the coast.

Economy

Greenland relies on financial aid from the Danish government. The island's economy also depends on fishing. The part of the land that is not covered in ice is used mainly to raise sheep and reindeer for meat, milk, and wool. In the north people hunt seals, polar bears, and foxes for their meat and skin.

History

The Inuit probably crossed from North America to northwestern Greenland between 4000 BC and AD 1000. In AD 986 Erik the Red, a Viking from Norway, started a colony on Greenland. The colony lasted until the 1400s. No other Europeans lived on Greenland until the 1700s. In 1721 the combined kingdom

Greenland does not have many roads. Many people travel by dogsled.

of Norway and Denmark started a new colony. After the union of Norway and Denmark ended in 1814, Denmark kept Greenland as a colony. In 1979 Denmark gave Greenland the power to govern itself. But Denmark kept control of Greenland's foreign relations.

Green Revolution

Every year millions of people get sick or even die because they do not have enough to eat. Beginning in the 1940s scientists and governments started a movement called the Green Revolution to try to end this worldwide hunger. Its main goal was to end food shortages by improving agriculture, or farming.

Methods

The Green Revolution introduced new methods for growing, harvesting, and processing such crops as wheat, rice, corn, and potatoes. It brought modern machines and other technology to farming. As a result, farmers were able to produce more and better food.

Farmers in Mexico, India, Kenya, and many other countries began to grow new plant varieties created by scientists. They got larger crops as a result. Farmers also learned how to treat their crops with pesticides and fertilizers. These chemicals protected the plants from insect pests, weeds, and disease. Complex systems of irrigation, or watering,

U.S. scientist Norman Borlaug (standing at left) helped to start the Green Revolution. He explains new ways of growing wheat to farm leaders from all over the world.

also came into use. New machinery for plowing the soil and harvesting crops made farm work easier to do.

Mixed Results

Farmers still use the methods of the Green Revolution. One positive result of the movement was that many poor countries became able to grow enough food to feed their own people. This lowered the risk of famine, or a severe shortage of food.

However, the Green Revolution was not a complete success. Many of the pesticides and fertilizers were harmful to humans and polluted the land and water. Also, farmers had to buy the new seeds from other countries instead of using seeds from their own land. Finally, even though the movement produced more food, that food did not always reach the people who needed it.

Grenada

Grenada is a small island country in the eastern Caribbean Sea. Called the Isle of Spice, Grenada is known for growing nutmeg and other spices. The capital is Saint George's.

Geography

Grenada's territory includes the southern Grenadine Islands, which lie to the northwest of Grenada. (The northern Grenadines are part of the country of Saint Vincent and the Grenadines.) A ridge of mountains runs down the center of the island. Grenada has year-round warm weather and a long rainy season.

Plants and Animals

Rain forests of teak, mahogany, and other trees cover the mountains. Other plants include wild orchids and bamboo. Mona monkeys, agoutis (rabbit-sized rodents), mongooses, iguanas, land crabs, and rare leatherback turtles live on Grenada.

People

The majority of the population has black African or mixed African and European roots. There are also small groups of South Asians and whites. English is the main language. Most people are Christians, mainly Roman Catholics.

Economy

Grenada's economy depends on exports of nutmeg, fish, and cocoa. Grenada also grows sugarcane, coconuts, bananas, and other fruits and spices. Tourism is a very important industry.

History

The Arawak and later the Carib Indians were the earliest settlers of Grenada. In the 1600s the French took over the island and killed nearly all the Carib. The British captured Grenada in the 1700s. They brought slaves from Africa to work on sugarcane and spice plantations. The slaves were freed in 1833.

In 1974 Britain granted independence to Grenada. A dictator ruled until 1979, when a Communist party took over. In 1983 U.S. troops invaded Grenada and overthrew the Communist government. Grenada held democratic elections in 1984. In 2004 the island was seriously damaged by Hurricane Ivan.

Gretzky, Wayne

Wayne Gretzky skates with the Canadian hockey team at the 1998 Winter Olympic Games.

Wayne Gretzky played ice hockey in the National Hockey League (NHL). Many people think he was the best player in the history of the game. When he retired he held more than 60 NHL records. His nickname was the Great One.

Wayne Douglas Gretzky was born on January 26, 1961, in Brantford, Ontario. He started playing hockey at a very young age. At age 6 he played against 10- and 11-year-olds. In 1978 Gretzky became the youngest player ever in professional hockey when he joined the World Hockey Association (WHA).

Gretzky first played in the NHL in the 1979–80 season. As center and team captain, he led the Edmonton Oilers to four Stanley Cup championships. Gretzky was named the league's most

valuable player eight years in a row, from the 1979–80 through 1986–87 seasons.

After the 1987–88 season Gretzky was traded to the Los Angeles Kings. In the 1989–90 season he broke Gordie Howe's NHL career record of 1,850 points (goals and assists). Howe needed 1,767 games to score that many points. Gretzky broke the record in only his 780th game.

Gretzky played the last three years of his career for the Saint Louis Blues and the New York Rangers. He retired in 1999. His career totals included 2,857 points, 894 goals, and 1,963 assists. The NHL honored him by retiring his jersey number (99) after his final game. That means that no other NHL player will ever wear the number 99. Gretzky was elected to the Hockey Hall of Fame in 1999.

Grimké, Sarah and Angelina

The sisters Sarah and Angelina Grimké were born to slaveholders in the southern United States. But they became leaders of the abolitionist movement, which worked to end slavery. They also supported women's rights.

The Grimké sisters were born in Charleston, South Carolina. Sarah was born on November 26, 1792. Angelina was born on February 20, 1805. As chil-

Angelina Grimké (left) and Sarah Grimké

dren they came to hate slavery. In the 1820s both sisters moved to the North.

Both Sarah and Angelina wrote powerful letters and articles. They asked Southern women and Southern churches to turn against slavery. This made them unpopular in the South. In the North, though, they spoke to large audiences. Some people said that it was not proper for women to speak in public. The Grimké sisters then began to speak out for women's rights.

The Grimké sisters lived to see the end of slavery in the 1860s. Sarah died on December 23, 1873, in Hyde Park, Massachusetts. Angelina died in Hyde Park on October 26, 1879.

Grimm Brothers

The German brothers Jacob and Wilhelm Grimm collected some of the Western world's most popular stories.

They put together a famous book of folktales that has been published in at least 70 languages. The tales include such classics as "Snow White," "Rumpelstiltskin," "Rapunzel," "Cinderella," and "Little Red Riding Hood."

Jacob Ludwig Carl Grimm was born on January 4, 1785, in the German village of Hanau. Wilhelm Carl was born in Hanau on February 24, 1786. While in their 20s they began collecting folktales for a friend. The friend wanted to publish a collection of tales. The brothers wrote down tales that they heard storytellers tell out loud. The friend never used the tales, so the Grimms decided to publish them.

The Grimms sometimes changed the tales they heard. Sometimes they put their own views into the tales. Other times they combined several versions of a story into one.

Children follow the Pied Piper of Hamelin in a German illustration of the Grimm brothers' story.

The first volume of the tales was published in 1812. It was called *Children's and Household Tales*. Today the collection is commonly known as *Grimm's Fairy Tales*. The Grimms added to the collection for many years. Eventually it contained more than 200 tales.

Aside from collecting folktales, the Grimm brothers wrote books about the German language. They also worked for the government and as university professors and librarians. Wilhelm Grimm died on December 16, 1859, in Berlin, Germany. Jacob died there on September 20, 1863.

Gros Ventre

The Gros Ventre are Native Americans of northern Montana. Early French traders gave them their name, which means “big belly” in French. The name refers to the way the tribe was identified in Indian sign language. The traders mistakenly used the name Gros Ventre for the Hidatsa people as well. To help tell the tribes apart, the Gros Ventre are sometimes called the Atsina or the Gros Ventre of the Prairie.

The Gros Ventre traditionally depended on hunting bison (buffalo). Their main food was bison meat. They used bison hides to make clothing and to cover their tepees.

The Gros Ventre once may have lived near the Great Lakes as part of the

A photograph from the early 1900s shows a band of Gros Ventre on horseback.

Arapaho tribe. By 1700, however, they had become a separate tribe. In the middle of the 1700s European traders began coming to Gros Ventre territory. The tribe then lived on the plains of what is now southern Canada. The traders brought with them diseases such as smallpox. The diseases killed many Gros Ventre.

By the middle of the 1800s the Gros Ventre had been pushed south into northern Montana. In 1888 the U.S. government moved the Gros Ventre to the Fort Belknap Reservation. Later they had to share the reservation with the Assiniboin, who were their traditional enemies.

At the end of the 20th century there were about 3,000 Gros Ventre. Many made their living through farming and ranching.

Groundhog

The groundhog is a large rodent that belongs to the squirrel family. It is also called the woodchuck. The groundhog's scientific name is *Marmota monax*.

The groundhog lives in the United States and Canada. It can be found in meadows and forests.

The groundhog weighs about 4 to 13 pounds (2 to 6 kilograms). Not counting its bushy tail, the groundhog is about 13 to 20 inches (33 to 51 centimeters) long. Its fur is brown or reddish brown. The groundhog has strong legs and heavy claws that are good for digging.

The groundhog lives in a burrow, or hole. It eats grass and other plants. During the winter the groundhog hibernates in its burrow. It hardly moves or eats for months.

In the United States and Canada, February 2 is Groundhog Day. On this day people watch as a groundhog comes out of its burrow. If the animal sees its

Guadeloupe

A group of islands in the Caribbean Sea, Guadeloupe is an overseas department (a type of province) of France. The two largest islands are Basse-Terre (to the west) and Grande-Terre (to the east).

Guadeloupe lies north of the island country of Dominica. Basse-Terre is mountainous, while Grande-Terre is flatter. Smaller islands called Marie-Galante, La Désirade, the Saintes Islands, and Saint-Barthélemy also belong to Guadeloupe. In addition, the northern part of the island of Saint Martin is a part of Guadeloupe. Guadeloupe has warm weather year-round and a rainy season. The islands are sometimes struck by hurricanes.

Forests of mahogany, chestnut, and ironwood trees cover much of Basse-Terre. Grande-Terre's forests have been cleared. The islands' warm waters are home to lobsters, octopuses, parrot fish, and rays. Iguanas, raccoons, rodents called agoutis, and a variety of birds live on land.

Most Guadeloupeans are Creoles, or people with both African and European ancestors. Blacks and people with mixed French and East Asian roots

A woman sells items in a market in the town of Marigot on Saint Martin island, Guadeloupe.

form smaller groups. French is the main language. Most people are Roman Catholics.

Guadeloupe depends on money and food from France. Many people work for the government. Tourism is another major industry. Guadeloupe produces bananas, sugar, rum, and cement.

The Carib Indians drove the Arawak Indians off the islands before Christopher Columbus arrived in 1493. French traders set up a colony in the 1600s. The French defeated the Carib and brought Africans to the islands as slaves.

In 1946 France changed Guadeloupe from a colony to a department. Guadeloupe has its own legislature as well as representatives in France's legislature.

Guam

Guam is an island in the western Pacific Ocean. It is the largest and most populous island in the group called the Mariana Islands. Guam is a territory of the United States. It has important U.S. military bases.

Guam is a long, narrow island. The northern half is a plateau, or raised flat area, made of limestone. To the south are steep hills. Coral reefs and beaches line the shores. The weather is tropical.

The local people of Guam are called Chamorros. They are descendants of the island's early people, who came from Indonesia. The population also includes many Filipinos and other Asians, as well as U.S. military personnel and their families. Chamorro and English are the main languages. Most of the people are Roman Catholics.

U.S. military bases and tourism are the most important parts of Guam's economy.

People first arrived on Guam before 1500 BC. The first settlers probably were Indonesian. Europeans arrived on the island in the early 1500s. Spain claimed Guam in 1565. In 1898 the island was a battle site in the Spanish-American War. After the United States defeated Spain, Guam came under U.S. control. Today Guam governs itself, but it is still a U.S. territory.

Did You Know?

The people of Guam are U.S. citizens, but they cannot vote in U.S. presidential elections.

Guatemala

The Central American country of Guatemala was the center of the great civilization of the Maya. Modern Guatemala has experienced unstable governments and much violence. The capital is Guatemala City.

Geography

Guatemala is bordered by Mexico, Belize, Honduras, and El Salvador. It has coasts on the Caribbean Sea and the Pacific Ocean. Along the Pacific in the south is a fertile coastal plain. North of the plain is a row of volcanoes. The volcano Tajumulco, at 13,845 feet (4,220 meters), is the highest peak in Central America. Mountains rise in the middle of the country. In northern Guatemala is the Petén, a heavily forested area with few people. It is known for its Mayan ruins.

The low-lying coastal regions and the Petén are hot year-round, but tempera-

tures are cooler at higher elevations.

Most of the country has a dry season, but the Caribbean coast receives rain all year.

Plants and Animals

The tropical rain forests of the Petén are rich in fine woods and rubber trees. This region also has savannas, or grasslands with some trees. Oak and pine forests grow in the mountains. Mangrove trees grow in swamps near the Pacific.

Guatemala's wildlife includes jaguars, monkeys, and parrots. The rain forests are home to the brightly colored quetzal, which is the national bird of Guatemala.

People

More than half of Guatemala's people are Ladinos, who usually have both American Indian and Spanish ancestors. Most of the rest of the people are Mayan Indians, who follow their traditional way of life. There are also small numbers of blacks and whites. Spanish is the official language, but many Indians speak their own languages. The majority of the people are Roman Catholics. Many Indians combine Roman Catholicism with traditional Mayan beliefs.

Nearly half of Guatemalans live in cities or towns. The largest city, Guatemala City, lies in the central mountains. Most of the rest of the major cities are near the Pacific coast.

© 2006 Encyclopædia Britannica, Inc.

Economy

More than half of Guatemala's people work as farmers. The main food crops are corn, beans, and squashes. Commercial farms produce coffee, sugar, bananas, and livestock for export.

Manufacturing is another important part of the economy. Factories make food products, clothing and textiles, and metal goods. Guatemala also produces some petroleum (oil). Tourism is a growing industry.

History

The Maya developed an advanced civilization that spread through what are now Guatemala, southern Mexico, and northern Belize. Mayan culture reached its height between AD 250 and 900. In 1523 Spanish soldiers conquered the Maya. The Spanish forced the Indians to work on plantations and in mines. Many Indians died from European diseases.

Guatemala gained independence from Spain in 1821. Guatemala was part of the Mexican Empire until 1823. Guatemala then joined Honduras, El Salvador, Costa Rica, and Nicaragua in a union called the United Provinces of Central America. In 1839 Guatemala became an independent republic.

A series of dictators and military leaders ruled Guatemala for many years. Large landowners became wealthier while peasants became poorer. Beginning in the 1960s rebel groups attacked the government. More than 100,000 people died during the civil war, which ended in 1996. The military's control of politics also ended in the 1990s. Nevertheless, violence continued into the 21st century.

Guatemala City is the capital of the Central American country of Guatemala. It is the largest city in Central America.

Guatemala City is the center of culture and education in Guatemala. It is also the country's center of banking, business, industry, and transportation. Most of the country's manufacturing takes place in the Guatemala City area. Some factories in the city process oil. Other factories make tires, medicines, and fab-

rics. In addition, Guatemala City has an international airport.

In the 1500s Spain took control of Guatemala. For many years another city was the capital of Guatemala. In 1773 earthquakes nearly destroyed that city. Guatemala City was founded in 1776 to be the new capital.

Guatemala and other Central American colonies became free from Spanish rule in 1821. They joined together in a union. Guatemala City was the capital of the union. In 1839 Guatemala became an independent country with Guatemala City as its capital.

Earthquakes shook Guatemala City for six weeks in 1917 and 1918. Much of the city had to be rebuilt.

Guatemala

A cathedral towers above a public square in Guatemala City.

Guinea

The West African nation of Guinea has a largely poor, rural population. However, its rich mineral deposits could make it one of the wealthiest countries in the region. The capital is Conakry.

Geography

Guinea borders Guinea-Bissau, Senegal, Mali, Côte d'Ivoire, Liberia, and Sierra Leone. The Atlantic Ocean is to the west. The Fouta Djallon highlands cover much of central Guinea. West Africa's three major rivers—the Niger, the Gambia, and the Senegal—begin in the highlands. Guinea has a hot, humid climate with dry winters and wet summers.

Plants and Animals

Tropical rain forests of teak, mahogany, and ebony trees grow in the southeast. Grasses in northern Guinea may be 5 to 10 feet (1.5 to 3 meters) tall. Baboons, hyenas, and poisonous snakes are common.

People

Guinea's main ethnic groups are the Fulani, the Malinke, and the Susu. Each has its own language, though the official language is French. The majority of the people in Guinea are Muslims. Almost two thirds of the people live in rural areas.

Economy

Guinea's economy depends on agriculture and mining. Crops include cassava, rice, oil palm fruit, plantains, sugarcane, peanuts, and coffee. Guinea is one of the world's top producers of bauxite, which is used to make aluminum. Guinea also has reserves of iron ore, gold, and diamonds.

History

The Fulani dominated the Fouta Djallon region by the 1500s. By that time the Portuguese had already arrived on the coast. They developed the slave trade, which continued until the 1800s. By 1890 the French had made Guinea a colony. In 1895 it was made part of the colonial territory called French West Africa.

Guinea gained independence in 1958. The first president ruled as a brutal dictator. In 1984 the army took control of the government. Guinea held its first democratic elections in 1993. Military leaders were elected and remained in power into the 21st century.

Guinea-Bissau

The Republic of Guinea-Bissau lies on Africa's northwestern coast. It is one of the poorest countries in the world. The capital is Bissau.

Geography

Guinea-Bissau borders Senegal and Guinea. The Atlantic Ocean forms its western border. The country's territory includes the Bijagós Islands to the southwest. Guinea-Bissau has lowlands near the coast, a central plain, and highlands in the northeast. The climate is hot year-round, with heavy rainfall along the coast.

Plants and Animals

Mangroves and palm trees grow near the coast. The interior plain is heavily forested. The north is mainly savanna, or grassland with scattered trees. Wildlife includes crocodiles, snakes, gazelles, leopards, hyenas, apes, flamingos, and pelicans.

People

Guinea-Bissau's population includes about 20 ethnic groups. The largest are the Balante, the Fulani, the Mandyako, the Malinke, and the Pepel. Portuguese is the official language, but many people speak Crioulo, a mixture of Portuguese and African languages. Most of the people practice traditional religions or Islam. About one third of the people live in cities.

Economy

Guinea-Bissau's economy depends on farming. Crops include cashews, oil palm fruit, rice, cassava, sweet potatoes, coconuts, and cotton. Farmers also raise cattle, pigs, sheep, and goats. The main industries are wood and food processing, especially of fish. Cashews are Guinea-Bissau's most important export.

History

Farming peoples have lived in what is now Guinea-Bissau for more than 1,000 years. The Portuguese arrived in the 1440s and soon set up a slave trade. Portugal took control of the whole territory by 1915.

Guinea-Bissau won independence in 1974. During 1980–99 a military general ruled the country. In 1998 a civil war forced many people to leave. Political instability continued into the 21st century.

Guinea Pig

Some domestic guinea pigs are a combination of colors.

The domestic, or tamed, guinea pig is a small rodent that is popular as a pet. It is also used in medical research. Several other species, or types, of guinea pig live in the wild.

Guinea pigs have a stocky body, short ears, and no tail. They are about 8 to 16 inches (20 to 40 centimeters) long and weigh 1 to 3 pounds (0.5 to 1.5 kilograms). The front feet have four toes and the back feet have three. Each toe ends in a sharp claw.

Wild guinea pigs are found in South America. They live near forests and swamps and in grasslands and rocky places. They spend the day in underground holes called burrows. At night they come out to eat grass and leaves. They have long, rough gray or brown fur.

The domestic guinea pig can have long, short, silky, coarse, or smooth fur. It may be black, white, tan, cream, or

brown. Some have a combination of these colors. Like its wild relatives, the domestic guinea pig eats plants.

Gull

The waterbirds called gulls can be found nearly all around the world. They are commonly heard screaming and seen swooping over the water at seacoasts and lakeshores. Gulls can fly, swim along the water surface, and walk well.

There are more than 40 species, or types, of gull, including kittiwakes. Gulls belong to the scientific family Laridae, along with terns. Terns are similar to gulls in many ways. However, terns tend to be smaller and more slender than gulls. Terns also have shorter legs, longer wings, and straighter bills.

A group of gulls flies through the air.

Adult gulls are usually white or gray, sometimes with dark markings. They range in length from about 11 to 31 inches (28 to 79 centimeters). Their long wings help them glide. Wing-spreads range from about 24 inches (61 centimeters) in the little gull to about 65 inches (165 centimeters) in the great black-backed gull. A gull's bill is strong and slightly hooked. Its webbed feet help it swim.

A gull's favorite food is fish. Gulls can land on the water to feed or rest. These birds also eat a great variety of other foods, including shellfish, insects, worms, mice, birds' eggs, dead and rotting animals, and even garbage.

Gutenberg, Johannes

In the 1400s Johannes Gutenberg of Germany invented a new method of printing. It used movable type—metal letters that could be arranged and rearranged to form words. It also used a machine called a press. His method was so good that very few improvements were made to it for 400 years afterward.

Gutenberg was born in Mainz, Germany, in the late 1300s. Little is known about his life. As a young man he learned how to work with metal.

In about 1430 Gutenberg moved to Strassburg (now Strasbourg, France).

Scholars call Johannes Gutenberg's printed Bible the 42-line Bible because each page has 42 lines of printing. It was completed by 1455.

There he tried out new printing methods. At that time most books were copied by hand. That was a slow process. He wanted to find a way to copy books more quickly using a machine.

The solution that Gutenberg found was movable type. Gutenberg made metal molds of each letter. He poured liquid metal into the molds. When the liquid hardened it formed pieces of type. He removed the pieces from the molds. He then then arranged the pieces of type to form words, sentences, and paragraphs. Gutenberg also developed a printing press to hold the type in place and press paper against it.

By 1450 Gutenberg had returned to Mainz. The most famous book he printed there was a Bible. It is sometimes called the Gutenberg Bible. He died in Mainz in 1468.

Printing

Did You Know?

After the Bible, Gutenberg's second most famous book was a Psalter, or a collection of sacred songs.

Guyana

The only English-speaking country in South America is Guyana. Its name, meaning “Land of Waters,” refers to its many rivers. The capital is Georgetown.

Geography

Guyana borders Venezuela, Brazil, and Suriname. The Atlantic Ocean lies to the northeast. A narrow, fertile plain extends along the coast. Forested highlands cover most of the land. Guyana’s main rivers flow from the south into the Atlantic. Guyana is close to the equator and has a rainy, warm climate.

Plants and Animals

Tropical trees fill the huge rain forests of Guyana. Along the coast are mangrove trees and saltwater grasses. The southwest is grassland dotted with palm trees.

Tapirs, jaguars, monkeys, sloths, anteaters, and macaws live in the rain forests. Giant anacondas, the largest snakes in the world, also live in Guyana.

People

East Indians, or the Indo-Guyanese, make up about half of the population. Blacks, or the Afro-Guyanese, form the next largest group. There are smaller groups of American Indians, Portuguese, and Chinese. Guyana’s main language is English. Christianity and Hinduism are the most common religions. Most people live in villages near the coast.

Economy

Guyana is a poor country with an economy based on farming and mining. Major crops include rice, sugarcane, coconuts, cassava, bananas, and pineapples. Mines provide bauxite (used to make aluminum), gold, and diamonds. Shrimp and timber are other important products.

History

Arawak and Carib Indians originally lived in the Guyana region. The Dutch set up sugarcane plantations in the 1600s. The British later bought the land. They formed the colony of British Guiana in 1831. When the colony’s African slaves were freed, the British brought in workers from India.

Guyana gained independence in 1966. Since then Guyana has argued with Venezuela and Suriname over its borders.

Gymnastics

A rhythmic gymnast performs with a ribbon.

The sport of gymnastics tests an athlete's strength, grace, and body control. Gymnasts perform such acrobatic feats as somersaults, backflips, handstands, and cartwheels. Almost all gymnastic events are performed on special equipment, such as rings or bars. This equipment is called apparatus.

Gymnastics is a very popular sport at the Summer Olympic Games. Three types of gymnastic events are held at the Olympics. They are called artistic gymnastics, rhythmic gymnastics, and trampoline.

Artistic Gymnastics

Artistic gymnastics consists of six men's events and four women's events. The men's events are floor exercise, pommel horse, rings, vault, parallel bars, and horizontal bar. The women's events are floor exercise, vault, uneven bars, and balance beam.

Men's Events

The floor exercise is performed on a square, padded mat. The gymnast does acrobatic feats while moving around the mat. The feats include tumbling, leaps, and handstands.

The pommel horse is an apparatus that looks something like a horse's midsection. It has two curved handles, called pommels, on top. Gymnasts grip the pommels with their hands. They move their bodies, especially the legs, constantly around the pommel horse.

The rings (or still rings) are an apparatus made up of two small circles. The rings are attached to straps hanging from an overhead support. While grasping the rings, the gymnast performs a routine in midair. The routine combines swinging movements and the holding of certain positions.

In the event called the vault, the gymnast leaps over an apparatus called a vaulting table. A springboard is placed at one end of the vaulting table. The gymnast takes a running start and jumps off the springboard. Then the gymnast pushes off the vaulting table with the hands. Before landing, the gymnast performs such acrobatic feats as twists or cartwheels.

The parallel bars are two long bars raised 6.5 feet (2 meters) above the floor. A routine on the bars includes swings, handstands, and other feats.

The event called the horizontal bar (or high bar) has the gymnast perform on a

Men's Gymnastics

single bar. The gymnast performs acrobatic moves while swinging above and below the bar.

Women's Events

The women's floor exercise and vault are similar to the men's events. However, women gymnasts perform their floor exercise to music. The women's event highlights grace more than strength.

The women's competition called the uneven parallel bars is something like the men's parallel bar event. In the women's event, however, the two bars are not set at the same height. During the routine the gymnast swings from bar to bar.

The balance beam is a wooden beam that is only 4 inches (10 centimeters) wide. It is 4.1 feet (1.25 meters) above the floor. While balancing on the beam, the gymnast performs jumps, turns, flips, and other moves.

Rhythmic Gymnastics

Rhythmic gymnastics is a blend of ballet, acrobatics, and juggling. At the Olympics it is held for women only. The gymnasts perform to music while holding such items as ropes, hoops, balls, clubs, or ribbons. The gymnasts must display rhythm, grace, and flexibility.

Trampoline

A trampoline is a mat of stretchable material on a metal frame. Springs

Men's gymnastics events are floor exercise, horizontal bar, rings, parallel bars, pommel horse, and vault.

Did You Know?

The term gymnastics comes from the Greek word meaning "to exercise naked." In ancient Greece male athletes exercised unclothed in a gymnasium.

Women's Gymnastics

Women's gymnastics events are floor exercise, uneven parallel bars, balance beam, and vault.

attach the mat to the frame. Gymnasts bounce up and down on the trampoline. While in the air they perform acrobatic moves. At the Olympics the trampoline competition is held only for individuals, not teams. There are men's and women's trampoline events.

Gyroscope

A gyroscope is a device that can be used to tell when a moving object has changed direction. Gyroscopes are most useful in navigation. They help keep aircraft and ships on a steady course. The oldest type of gyroscope is a mechanical device. It has a wheel that spins in a special frame.

When a wheel spins, it has a kind of energy called angular momentum. This means that it will keep spinning in the same direction as long as it is spinning fast enough. The gyroscope's frame allows the wheel to keep spinning in the same direction even when the frame is moved. If the frame is attached to an object, such as a boat, sensors on the frame can tell when the object has changed direction. Other gyroscopes use beams of light instead of a wheel.

A mechanical gyroscope has a wheel set in a special frame. The frame includes a rod called an axle and two rings called gimbals.

Habitat

A habitat is the home of an animal or a plant. Almost every place on Earth—from the hottest desert to the coldest ice pack—is a habitat for some kinds of animals and plants. Most habitats include a community of animals and plants along with water, oxygen, soil or sand, and rocks. This community is known as an ecosystem.

Types of Habitats

The two main types of habitats are land habitats and water habitats. Among the many types of land habitats are rain forests, deserts, and mountains. Because of their moist climate, rain forests support more kinds of plant and animal life than any other habitat. In contrast, deserts support only animals and plants that can live without much water. Mountain habitats have thin soil and cold temperatures. Only hardy plants and animals live there. Other types of forests, grasslands, and tundras provide other land habitats.

A deer and her fawn stand in a forest. Forests provide habitats for many living things.

Water habitats may contain freshwater or salt water. Freshwater habitats include streams, rivers, swamps, marshes, ponds, and lakes. Saltwater habitats include oceans, seas, salt lakes, salt marshes, and saltwater swamps. Some animals and plants, such as fish and seaweed, live entirely in the water. Others, such as otters and riverweeds, live partly in and partly out of the water.

Adaptation

Over long periods of time animals adapt to fit their habitat. This means that they develop traits that help them to survive where they live. Animals adapt so that they can stay safe, travel well, and find food in their habitat.

Many animals that live in cold habitats grow thick coats of fur to keep them warm. Their fur may also be white so that their enemies cannot see them when the ground is covered with snow. The hard shell of the desert tortoise keeps in moisture and protects it from enemies. Dolphins have sleek bodies for swimming in the ocean. Giraffes have long necks so that they can nibble tender leaves from the tops of trees.

Hades

In ancient Greek mythology Hades was the god of the underworld, or land of the dead. He was one of the 12 main gods of Mount Olympus. The ancient Greeks also called him Pluto, which was his Roman name. Once people died and

In ancient Greek mythology the god Hades ruled the land of the dead. He kidnapped Persephone and made her his wife.

went to the underworld, they could not leave. For this reason Hades was often pictured holding a key. This represented his role as jailer of the dead.

According to legend, Hades was the son of Cronus and Rhea, king and queen of the Titans. The Titans were giants who ruled the world. Hades' brothers were the gods Poseidon and Zeus. The three brothers fought and won a long war against the Titans. The brothers then drew lots to decide how to divide up the world. Hades won command of the underworld.

The most famous story about Hades explains the change of seasons. Hades carried Persephone off to the underworld. She was the daughter of Demeter, the goddess of farming. Eventually, Persephone was able to leave the underworld. But she had to return there for part of every year. Demeter would not let anything grow when Persephone was away. This created winter.

Amsterdam is the official capital of The Netherlands. But the country's government and court meet in a city called The Hague. The International Court of Jus-

The Peace Palace is located in The Hague. It is the home of the International Court of Justice.

tice is also located in The Hague. It is the highest court of the United Nations. The Dutch royal family has a palace in The Hague as well.

The Hague is mainly a center of government and business headquarters. Trade, banking, and insurance are also important to the city's economy.

The Hague grew around a castle built in 1248. The castle buildings were home to the counts of the region called Holland. The government of Holland began meeting in the buildings in the late 1500s.

The region came under French rule in the late 1700s. The Netherlands became an independent country in 1815. Its government offices were then moved from The Hague to Amsterdam, the new capital. The government returned to The Hague in 1913.

During World War II (1939–45) German forces destroyed whole sections of

the city. The damaged areas were rebuilt after the war.

Haida

The Haida are a tribe of Native Americans who traditionally lived on the Queen Charlotte Islands off the coast of what is now British Columbia in Canada. In the early 1700s a small group of Haida moved to Prince of Wales Island in what is now Alaska.

The Haida were skilled in woodworking. They carved ceremonial masks and chests. They also made redwood canoes that they traded to other tribes. The Haida lived in large rectangular houses that they built from cedar planks. They

The Haida were excellent woodcarvers. They sometimes decorated their carvings with paint and seashells.

fished and hunted seals, sea lions, black bears, and deer for food.

In the late 1700s traders from Spain, England, Russia, and France began setting up posts in Haida territory. The Haida traded skins and furs in exchange for knives, metal pots, and other European goods. But the Europeans also brought diseases, such as smallpox, that killed many Haida. In addition, the Canadian and U.S. governments and Christian missionaries forced the Haida to give up some of their traditions.

In the early 21st century there were about 5,000 Haida. Some live in Canada and some live in the United States. The Canadian Haida live in two villages, Masset and Skidegate. Many of the Haida in the United States live in Hydaburg, a city at the southern end of Prince of Wales Island.

Hair

Hair is a thin, flexible structure that grows from the skin of every mammal. Like horns and nails, hair is made mainly of a protein called keratin.

Individual hairs have a shaft and a root. The shaft sticks out of the skin's surface. This part of the hair is dead. The root lies beneath the skin's surface in a pit known as a follicle. At the base of the root are living cells. As these cells multiply, they push old cells out of the skin. This is how hair grows.

The long hair on a horse's head is called a mane.

Hair growth varies widely among mammals. Many mammals, such as dogs and horses, have a coat of hair that covers most of the body. When the coat is thick and soft, as in rabbits, it is known as fur. Whales and hippopotamuses have only a few hairs.

Humans have less hair than most mammals. Usually, most of the hair on a human body grows from the scalp.

One of the main purposes of hair is to keep an animal warm. It also helps to keep moisture away from the skin. Whiskers are a type of hair that helps animals to feel things.

People make cloth from the hair of sheep, goats, camels, and other animals. They use the fur of mink, foxes, rabbits, and other animals to make coats and hats.

Did You Know?

People have about 100,000 to 150,000 hairs on their head.

Haiti

The Republic of Haiti is the only independent French-speaking country in the Americas. Haiti gained independence in 1804 after its slaves revolted against their French masters. The capital and largest city is Port-au-Prince.

Geography

Haiti occupies the western third of the island of Hispaniola in the West Indies. The Dominican Republic covers the rest of Hispaniola. The Atlantic Ocean is to the north, and the Caribbean Sea is to the west and south.

The land is mountainous. At 8,773 feet (2,674 meters), Mount la Selle in the south is Haiti's highest point. Between the mountains are fertile plains. The Artibonite is the longest of Haiti's many rivers. Haiti has a warm, humid tropical climate. Droughts happen occasionally, and hurricanes are common between August and November.

A Haitian man sells paintings of Haitian scenes.

Plants and Animals

Most of Haiti's original forests have been cut down. Some evergreen forests still exist in the mountains. Coconut, coffee, cacao, avocado, mango, lime, and orange trees grow wild. Dry areas have thorny scrub and cacti.

Haiti's wildlife is also limited. It includes flamingos and such reptiles as lizards and caimans, which are similar to alligators.

People

Nearly all the people of Haiti have African roots. Most of the rest of the people are mulattoes, or people with both white and black ancestors. Most people speak Haitian Creole, a mixture of French and African languages. French is also common. Most Haitians are Roman Catholics, but many Catholics also practice voodoo. Voodoo is a folk religion that combines African and Catholic beliefs.

A fortress called La Citadelle Laferrière stands on a peak near the city of Cap-Haïtien, Haiti. The fortress was built in the early 1800s.

The majority of Haitians live in rural areas. Haiti's cities are very crowded, however.

Economy

Haiti is the poorest country in the Americas. About 80 percent of the people live in poverty.

Services—including government work, tourism, shops, and restaurants—are the main economic activities. However, most people work in agriculture. Haitians raise goats, cattle, and pigs. Food crops include cassava, bananas, corn, yams, and rice. Cocoa, coffee, and mangoes are exported.

Many of Haiti's industries put together parts imported from the United States. They produce such goods as clothing and electronic components. Other manufactured products include flour, sugar, cement, cigarettes, and alcoholic beverages.

History

When the explorer Christopher Columbus arrived in Hispaniola in 1492, more than a million Arawak Indians lived on the island. Spanish settlers wiped out the Arawak by about 1600.

In 1697 Spain gave western Hispaniola to the French, who renamed it Saint-Domingue. People brought from Africa worked as slaves on sugar and cotton plantations. In 1791 the slaves began a revolution. They declared the independence of Haiti in 1804. The new country's name came from an Arawak word meaning "mountainous land."

As an independent country Haiti continued to face political problems. U.S. Marines occupied the country during 1915–34. Dictators and the military also ruled Haiti. The country held its first free presidential elections in 1990. In 1991, however, a military group overthrew President Jean-Bertrand Aristide. U.S. troops helped Aristide to return to office. In 2004, during Aristide's second term, rebels forced the president to step down once again.

Halloween

Halloween takes place on October 31. It is a time when people dress up in costumes, go trick-or-treating, and carve jack-o'-lanterns from hollowed out pumpkins. Ghosts and witches are popular costumes of the children who go from house to house saying, "Trick-or-treat!" The treat is usually candy. The origins of Halloween date back to several ancient festivals held in the autumn.

In ancient times, the holiday was marked by customs started by pagans. Pagans believed in many gods rather than a single god. It was believed that on the last night of October, the spirits of the dead roamed Earth. The holiday is also called All Hallows' Eve. In the Christian church, All Hallows' Eve is the night before All Saints' Day. On November 1, All Saints' Day honors all of the Christian saints. Gradually, Halloween became a nonreligious celebration.

Children in colorful costumes go trick-or-treating on Halloween.

Hamilton, Alexander

Alexander Hamilton

Alexander Hamilton was one of the youngest and brightest of the founders of the United States. He was the first secretary of the treasury. He worked to create a strong U.S. government.

Early Life

Hamilton was born on January 11, probably in 1755, in the British West Indies. He later went to school in New Jersey and New York. During the American Revolution Hamilton joined the military. From 1777 to 1781 he served with General George Washington. After the war Hamilton became a lawyer.

Political Career

Hamilton believed that the United States needed a strong national government. He supported the new U.S. Constitution because it set up such a government. Hamilton, James Madison,

and John Jay wrote a famous series of essays to explain the Constitution. Those essays were later called the Federalist papers.

In 1789 George Washington, now U.S. president, made Hamilton secretary of the treasury. Hamilton planned for a tax system and a national bank. His financial program strengthened the national government.

Thomas Jefferson, the secretary of state, disagreed with Hamilton. He believed that the states should have more power. The two men and their supporters started the first U.S. political parties. Hamilton led the Federalist Party, while Jefferson led the Republican Party.

Retirement

Hamilton resigned as secretary of the treasury in 1795. He stayed active in politics, however. Hamilton got involved in the presidential election of 1800. Jefferson and Aaron Burr were two of the main candidates. Hamilton and Burr did not like each other. Hamilton set aside his quarrel with Jefferson and helped him get elected.

In 1804 Hamilton supported Burr's opponent in the election for governor of New York. Angered once again, Burr challenged Hamilton to a duel. Burr shot Hamilton on July 11, 1804. Hamilton died the next day.

Hamster

Hamsters are small mammals that belong to the rodent family. Like mice, squirrels, beavers, and other rodents, they have large front teeth that they use for gnawing and nibbling. Hamsters are among the few animals born with developed teeth.

In the wild, hamsters live in dry areas in central Europe, the Middle East, and Asia. For shelter, hamsters dig burrows, or underground tunnel systems. They use these burrows for sleeping and for storing food.

Today many people in every part of the world keep hamsters as pets. The most common species, or type, of hamster kept as a pet is the golden hamster. Golden hamsters originally came from Syria.

Hamsters have a plump body and a short tail. Golden hamsters have yellowish or reddish brown fur and white bel-

Golden hamsters are popular pets. People often keep them in small cages.

lies. Other types of hamster have gray or black fur. Most adult hamsters weigh about 5 ounces (150 grams). They have poor eyesight but good senses of smell and hearing. Hamsters have large pouches in their cheeks to carry food.

Hamsters are nocturnal, or active at night. They sleep during the day. Hamsters eat almost anything, especially seeds and grains.

Most hamsters live for about three years. They begin having babies at about 2 months old. Female hamsters may have a new litter of babies every month. A litter may have one to 13 babies.

Hand

The hand is a part of the body that extends from the end of each arm. Hands are a feature of most primates, including humans, apes, and monkeys. The hand has a flat, wide palm. It also has five parts called digits—a thumb and four fingers. Bones and muscles inside the hand allow the digits to move in many useful ways.

Structure

The human hand contains 27 main bones. Each finger has three bones. The thumb has two. The palm of the hand has five bones. The wrist, which attaches the hand to the arm, has eight bones. There are also some small bones near the base of the digits.

The hand of a human and the hand of a gorilla are similar in shape. However, a gorilla's hand is much larger and is also used for walking.

The four fingers extend upward from the palm. The thumb extends from the side of the palm. The tip of each digit has a nail. Each digit also has a unique pattern of ridges called a fingerprint.

Different muscles control the movement of each digit. All five digits can fold inward. The thumb can move to a position opposite the fingers. This so-called opposable thumb is the mark of a true hand. Animals with paws do not have opposable thumbs.

Function

Hands can push, pull, pat, scoop, and carry. They can wave, point, and make

Did You Know?

Because human fingerprints are unique to each person, they are used for identification.

many other gestures, or signs. With the opposable thumb, a hand can pick up small objects and handle tools.

Hands are also important for their sense of touch. They are very sensitive to different textures and temperatures. Their creases and ridges help them to feel and to hold things.

Hands in Apes and Monkeys

Like humans, apes and monkeys have opposable thumbs. They use their hands to pick things up, gather food, and groom each other. Many apes and monkeys also use their hands for climbing and swinging. In some species, or types, the fingers are extra long. These long fingers help them to grip tree branches.

Hanoi

Population
(2004 estimate)
1,420,400

Hanoi is the capital of Vietnam, a country of Southeast Asia. It is a large city located on the Red River. The city is unusual in that it has many lakes.

Modern Hanoi is a mix of new and historical buildings. One important struc-

Hanoi has many historical and scenic places, including buildings called pagodas. Pagodas are a feature of many Buddhist temples.

ture is the tomb of Ho Chi Minh. Ho was a powerful Vietnamese leader.

Factories in Hanoi make food products, electrical machinery, cloth, and other goods. The city's economy also depends on tourism and other services.

People have lived in the Hanoi area since ancient times. The city has long been a center of government. It was the capital of Vietnam from 1010 until 1802. French troops took over Vietnam in the late 1800s. In 1902 the French made Hanoi the capital of all their colonies in Southeast Asia.

The French left Vietnam in 1954. Vietnam was then split into two parts—North Vietnam and South Vietnam. Hanoi was the capital of North Vietnam. The two parts of Vietnam fought the long Vietnam War. The United States helped South Vietnam. Hanoi suffered great damage from U.S. bombing. The war lasted until 1975.

In 1976 the two parts of Vietnam again formed one unified country. Hanoi became the capital of all of Vietnam.

Hanukkah

Hanukkah (also spelled Chanukah or Chanukkah) is a Jewish holiday that lasts for eight nights and usually occurs in December. It is also known as the Festival of Lights.

Hanukkah celebrates a military victory of the Jews over foreign rulers. The Seleucid kingdom from neighboring Syria took control of Jerusalem in about 198 BC. Some 30 years later the ruler Antiochus tried to force the Jews to give up their religious practices. When he

The most important custom during Hanukkah is the lighting of the menorah. A blessing is usually offered as the candles are lit.

also took over their Temple they rose up against him. The leader of the rebellion was named Judas Maccabeus. He soon defeated the Seleucids. The Jews then cleaned, rebuilt, and rededicated the Temple in 164 BC.

According to tradition, the Jews found only one small jar of lamp oil when they entered the Temple, enough for just one night. With the oil, they relit the Temple's lamps. Miraculously, the oil lasted for eight nights until more oil was obtained.

To celebrate the eight nights of Hanukkah people light candles on a branched candlestick called a menorah. They start with one candle and add a new candle each night. In addition, children receive gifts and money, which is often in the form of chocolate coins. Children also play a Hanukkah game with a four-sided top called a dreidel.

Hapsburgs

The Hapsburgs (or Habsburgs) were a royal German family that ruled Austria from the late 1200s until 1918. They ruled many other countries of Europe for shorter times. Those countries included Bohemia (now part of the Czech Republic), Hungary, and Spain. The family's name comes from the Castle of Hapsburg, or Hawk's Castle, in what is now Switzerland. Ancestors of the family built the castle in 1020.

Rise

The first Hapsburg ruler was Rudolf I. He was crowned king of Germany in 1273. A few years later Rudolf took control of Austria. From then on Austria was the center of Hapsburg power.

Frederick V was crowned emperor of the Holy Roman Empire in 1452. Then he was called Frederick III. The Holy Roman Empire included much of western and central Europe. Between 1452

A painting shows Rudolph I, a Hapsburg, riding into a city. The Hapsburgs began ruling Germany in 1273.

and 1806, all but one of the Holy Roman emperors were Hapsburgs.

A World Power

The power of the Hapsburgs was at its greatest in the 1500s under Charles V. Charles was Holy Roman emperor and the king of Spain. His lands included all of Europe except for England, France, and Russia. Across the Atlantic Ocean, Charles's armies conquered rich empires in Mexico and Peru.

Before his death, Charles divided his lands between his brother and his son. This created two Hapsburg branches. One branch ruled Spain until 1700. The other branch ruled the rest of the empire. Beginning in 1804 the land ruled by the Hapsburgs was called the Austrian Empire. In 1806 the Hapsburg emperor gave up the title of Holy Roman emperor.

Slide from Greatness

During the 1800s some national groups within the Austrian Empire wanted to be independent. Among these groups were the Hungarians. To satisfy them, the Hapsburg emperor divided his empire with Hungary in 1867. The new empire was called Austria-Hungary.

Austria-Hungary was on the losing side during World War I. When the war ended in 1918, the empire collapsed. Hapsburg rule was over.

Zimbabwe

Harbor

A harbor is a deep body of water that protects boats near land. High waves and strong currents usually do not reach harbors, so boats stay safe while anchored there. Some harbors are created by surrounding land, which keeps the water calm. They are called natural harbors. Artificial, or man-made, harbors are created by structures called seawalls or breakwaters.

Where Harbors Are Found

Harbors are found along coasts around the world. Harbors are always part of a larger body of water—for example, a lake or an ocean. Coastlines that curve inward make good places for natural harbors. This type of coastline is often called a bay. Barrier islands, which run along a coast, also create natural harbors. For example, New York Harbor lies between the coast of New York and Long Island.

Harbor Uses

Harbors are useful for many purposes. Many harbors are used as ports. The main purpose of a port is the loading and unloading of boats. People ship goods of all kinds to and from the ports of the world. People also travel by boat to and from these ports. For these reasons some of the world's major cities grew around busy ports. A lively shipping trade brings much money to the city where the port is located.

Harbors are not just for big shipping vessels and cruise ships. Ferryboats dock in harbors to pick up passengers for short journeys. For example, ferries bring people to nearby islands and back. People anchor small sailboats, yachts, and speedboats in harbors, too. From there they can take their boats out into the lake or the ocean for fishing, water-skiing, and other fun. Harbors also provide homes for many kinds of birds and fish.

ence Kling De Wolfe. The couple had no children.

Political Career

Harding became an Ohio state senator in 1898 and lieutenant governor in 1903. He ran for governor in 1910 but was defeated. In 1914, however, he was elected to the U.S. Senate.

TIMELINE

Harding is born near Corsica, Ohio.

November 2, 1865

Harding becomes lieutenant governor of Ohio.

1903

Harding is elected president.

1920

Harding's death makes Vice President Calvin Coolidge president.

August 2, 1923

Harding becomes an Ohio state senator.

Harding is elected to the U.S. Senate.

The United States and other countries agree to limit warships.

In 1920 Republicans chose Harding as their presidential candidate. Many voters were tired of President Woodrow Wilson and the Democrats' focus on international affairs. Harding promised to focus on the economy and other problems at home. He won the election easily.

Presidency

As president, Harding supported business and limited the number of immigrants allowed to enter the United States. During his term in office the United States also hosted an important international conference. Several countries agreed to reduce the number of warships that their navies would build. But Harding was not a strong leader. He appointed several dishonest men to government jobs. They took bribes, or illegal gifts, from companies and sold illegal liquor permits, among other things. Harding knew of some of those illegal activities but did not report them.

Death

By 1923 Congress was investigating the crimes of Harding's officials. Harding became ill, and on August 2 he died in San Francisco, California, from a heart attack or a stroke. Vice President Calvin Coolidge succeeded him as president.

Harpers Ferry

Harpers Ferry is a small town in the U.S. state of West Virginia. In 1859

An illustration shows U.S. Marines breaking into the arsenal at Harpers Ferry to capture John Brown.

Harpers Ferry was the site of a bloody raid in the movement to end slavery. The raid was one of the events that led to the American Civil War.

Harpers Ferry lies in the Blue Ridge Mountains where West Virginia, Virginia, and Maryland meet. At first the town was part of Virginia. It was named for Robert Harper. He settled there in 1734 and established a ferryboat service across the Potomac River. In the late 1700s the U.S. government set up an arsenal in Harpers Ferry. An arsenal is a place to make and store weapons.

On October 16, 1859, John Brown attacked the arsenal with a group of about 20 armed men. Brown wanted to end slavery. He believed that his raid would be the first battle in a slave rebellion. The raid was a failure. But it further divided the Northern and Southern states, which disagreed about slavery.

From 1861 to 1865 the North and the South fought each other in the Civil

War. The two sides fought many battles for control of Harpers Ferry. In 1863 the northwestern part of Virginia, including Harpers Ferry, became the new state of West Virginia. Today Harpers Ferry is part of Harpers Ferry National Historical Park.

Harrisburg

Population
(2000 census)
48,950; (2007
estimate)
47,196

Harrisburg is the capital of the U.S. state of Pennsylvania. The city lies on the Susquehanna River.

Many people in Harrisburg work for the government. The economy also depends on transportation and manufacturing.

The Harrisburg Symphony Orchestra plays for an audience on shore and in boats at a concert on the Susquehanna River.

Major highways and rail lines run through the city. Factories in Harrisburg produce steel, clothing, electronics, and machinery. The largest chocolate factory in the world is in nearby Hershey.

Harrisburg began as a trading post in about 1718. An Englishman named John Harris built the post to trade with the Susquehanna Indians. His son founded a town there in 1785. In 1812 Harrisburg became the capital of Pennsylvania. It soon developed into a transportation center. It became a stop on Pennsylvania's main railroad in 1847.

Harrison, Benjamin

Benjamin Harrison was the 23rd president of the United States. He won the 1888 election even though he got fewer votes than Grover Cleveland.

Early Life

Benjamin Harrison was born on August 20, 1833, in North Bend, Ohio. He was the son of John Scott Harrison, a farmer, and Elizabeth Irwin Harrison. His grandfather, William Henry Harrison, was the ninth U.S. president.

After graduating in 1852 from Miami University in Oxford, Ohio, Harrison studied in a law office in Cincinnati. In 1853 he married Caroline Lavinia Scott. The couple had two children.

Benjamin Harrison was the 23rd president of the United States.

Harrison moved to Indianapolis, Indiana, in 1854 to start his own law practice. He joined the new Republican Party and worked for the Indiana Supreme Court. During the American Civil War he fought for the Union.

Political Career

After the war Harrison returned to his law practice and his work at the Indiana

Supreme Court. In 1876 he ran unsuccessfully for governor of Indiana. Four years later he was elected to the U.S. Senate. He served there from 1881 to 1887.

In 1888 the Republican Party nominated Harrison for the presidency. His Democratic opponent was President Grover Cleveland. Harrison got about 100,000 fewer popular votes than Cleveland. However, Harrison won more votes in the electoral college, so he became president.

Presidency

As president, Harrison expanded the role and power of the United States. He made treaties with several countries. His secretary of state held the First International Conference of American States, a meeting of countries in the Western Hemisphere. Harrison also tried to make Hawaii a U.S. territory, but Congress refused.

TIMELINE

Harrison is born in North Bend, Ohio.

August 20, 1833

Harrison is elected president.

1888

Harrison is elected to the U.S. Senate.

1880

Harrison signs the Sherman Antitrust Act to promote free trade.

1890

First International Conference of American States is held in Washington.

1889-90

Harrison loses to Grover Cleveland in the presidential election.

1892

Harrison dies in Indianapolis, Indiana.

March 13, 1901

In addition, Harrison signed the Sherman Antitrust Act of 1890. This law encouraged free trade and outlawed monopolies, or industries controlled by one company.

Harrison ran for reelection in 1892, but he lost to former president Cleveland. During the campaign Harrison's wife died.

Retirement

In 1893 Harrison returned to Indianapolis and his law practice. In 1896 he married his wife's niece, Mary Lord Dimmick. They had one daughter. Harrison died on March 13, 1901.

• Harrison, William Henry • United States

William Henry Harrison was the ninth president of the United States.

At age 18 Harrison joined the U.S. Army. He fought against the Northwest Indian Confederation, a group of Native Americans fighting white settlement on their land. In 1795 Harrison married Anna Symmes. They had 10 children.

Political and Military Career

In 1798 President John Adams made Harrison secretary of the Northwest Territory, which became the states of Ohio, Illinois, Indiana, Michigan, and Wisconsin. After the Northwest Territory was divided, he governed the new Indiana Territory.

Between 1802 and 1809 Harrison made a number of treaties, or agreements, with Native Americans in the territory. The treaties gave millions of acres of land to the United States. Angered by the treaties, Tecumseh, a chief of the Shawnee, organized an uprising. In

Harrison, William Henry

After an Army career, William Henry Harrison became the ninth president of the United States in 1841. Harrison died after only one month in office.

Early Life and Career

William Henry Harrison was born on February 9, 1773, at his family's plantation near Richmond, Virginia. He was the third son of Benjamin Harrison, a signer of the Declaration of Independence, and Elizabeth Bassett Harrison. Harrison attended Hampden-Sydney College from 1787 to 1790.

TIMELINE

1811 Harrison defeated Tecumseh at the battle of Tippecanoe. Harrison then became known as Old Tippecanoe.

During the War of 1812 with Great Britain, Harrison commanded U.S. forces in the Northwest. In 1813 his troops defeated the British and their Native American allies at the battle of the Thames in Ontario, Canada.

After the war Harrison served in the U.S. House of Representatives, the Ohio state senate, and the U.S. Senate. In 1836 the Whig political party nominated him for the presidency, but he lost the election to Martin Van Buren.

Presidency

In 1840 Harrison ran again for president. John Tyler was the vice presidential candidate. Their campaign slogan was “Tippecanoe and Tyler too.” Harrison won the election and took office on March 4, 1841. That day he

caught a cold that turned into pneumonia. Harrison died in the White House on April 4.

Hartford is the capital of the U.S. state of Connecticut. The city has a port on the Connecticut River.

Hartford is a center of business and industry. It is sometimes called the Insurance City. That is because many

The state Capitol is a government building in Hartford, Connecticut. It has a dome that is covered in gold.

large insurance companies are based there. Banks, hospitals, and government offices also provide many jobs. Factories in the city make aircraft parts, guns, and tools.

English settlers founded Hartford in 1635. It became one of the two capitals of Connecticut in 1701. (New Haven was the other capital.)

A newspaper called the *Hartford Courant* was started in 1764. Today it is the oldest U.S. newspaper that is still in business. The city's insurance industry started in 1794.

In 1875 Hartford became the only capital of Connecticut. In the late 1800s the city was home to two famous writers—Harriet Beecher Stowe and Mark Twain. Today people can visit the writers' homes, which have been preserved as museums.

Hatshepsut

Hatshepsut was one of only a few women to rule ancient Egypt. Some 3,500 years ago she achieved rare power as a queen.

Hatshepsut's parents were King Thutmose I and Queen Ahmose. Hatshepsut married her half brother Thutmose II. This was a common practice in her day. Her father died in about 1482 BC. Hatshepsut and her husband then came to power. In 1479 BC her husband died. Thutmose III, her stepson, then became king. But he was too young to rule. So Hatshepsut governed for him.

Hatshepsut steadily gained in influence. She soon had herself crowned as pharaoh (the supreme ruler). To strengthen

A statue of Hatshepsut was carved nearly 3,500 years ago.

her image as ruler, she wore the traditional clothing of a pharaoh. She even wore the usual false beard.

The queen had a temple built in her honor near the city of Thebes. Paintings on the temple walls record major events of her reign. She also made an effort to expand Egypt's trading. She sent ships to the southern coast of the Red Sea. The ships returned with valuable goods including gold, ebony, animal skins, and spices.

As the queen and her supporters grew older and weaker, Thutmose III and his followers grew stronger. Hatshepsut died in about 1458 BC. Thutmose III then took power.

Havana

Population
(2006 estimate)
2,174,790

Havana is the capital of Cuba, an island country in the Caribbean Sea. It is the largest city in the Caribbean region. Havana is known for its many buildings from the time Cuba was a Spanish colony. The city lies on a bay with a protected harbor.

Havana is the island's main port. It is also Cuba's center of business and industry. Factories in the city build ships and make processed foods, cloth, and chemicals. Havana cigars are world famous. Tourism also brings money to the city.

Spanish conquerors took over Cuba in the early 1500s. They founded Havana in 1519. The city later became the center of Spanish government in Cuba. It was also the main base for Spain's navy in the Americas. In the 1700s and 1800s Havana grew into a major port for trade.

In 1898 Cuba became an independent country with Havana as its capital. The city was famous for its lively nightclubs and places to gamble. Until 1959 Havana was a popular vacation spot for wealthy people from Cuba and the United States.

In 1959 Fidel Castro took power in Cuba. The United States disapproved of Castro and the government that he established. People from the United States stopped traveling to Havana. Castro also focused on improving conditions in the countryside, instead of in Havana. The city began to decline.

In 1982 the United Nations named Old Havana, the most historic part of the city, a World Heritage site. Then the government began to restore Havana's historic buildings.

Hawaii

Hawaii is the only U.S. state that is made up entirely of islands.

Some of the area's first settlers came from a place called Hawaiki. It is believed that the state's name was formed from this word. According to legend, a man named Hawaii Loa discovered the islands. Hawaii is nicknamed the Aloha State. Aloha is a Hawaiian word with several meanings. It is often used to mean "welcome," "hello," or "good-bye." The capital of Hawaii is Honolulu.

Geography

Hawaii is made up of about 132 islands and islets. The island chain is located in the Pacific Ocean about 2,400 miles (3,860 kilometers) from the western coast of the U.S. mainland. The Hawaiian Islands were formed by volcanoes and were built up over millions of years. The eight main islands in the chain are Hawaii, Maui, Oahu, Kauai, Molokai, Lanai, Niihau, and Kahoolawe.

Steep cliffs in the U.S. state of Hawaii meet the deep blue waters of the Pacific Ocean. Tourists from all over the world visit Hawaii to see its great natural beauty.

The island of Hawaii is often called the Big Island. That is partly because it is the largest of the islands. The nickname also helps distinguish it from the state as a whole. Hawaii is the youngest of the islands. It includes Mauna Loa, the world's largest volcano, and Kilauea, one of the world's most active volcanoes. The island is still growing. As the lava from Kilauea cools, it hardens and adds to the land.

The entire state is known for its pleasant weather. Despite the state's tropical location, cooling ocean currents keep the climate mild.

People

Hawaii is the only state in which the majority of the population does not trace its heritage back to Europe. The first people to live in Hawaii were probably people who sailed from the Mar-

quesas Islands. The Marquesas are part of a region called Polynesia. The Polynesians arrived in Hawaii perhaps as early as AD 400. The current population includes whites, Japanese, Hawaiians, Filipinos, and Chinese. Many people are of mixed ancestry. Oahu has the largest population of all the islands. The city of Honolulu is on Oahu.

Economy

Tourism is the basis of Hawaii's economy. Almost 7 million tourists visit each year to enjoy the island scenery, mild weather, and beautiful beaches. Hawaii also has several military bases. Military spending plays an important role in the state's economy. Agriculture is another source of state income. Pineapples, sugarcane (for sugar), and macadamia nuts are major crops.

History

Hawaii was settled more than 1,500 years ago by people from Polynesia. The

first European to reach the islands was British explorer James Cook, who arrived at Kauai Island in 1778. At that time each island was ruled by its own individual chief. By 1810, however, King Kamehameha I had united all of the islands under his rule. Missionaries, traders, planters, explorers, and adventurers began arriving on the islands in the 1820s.

In 1858 the Kingdom of Hawaii asked to become part of the United States but was refused. In 1893 a revolution led to the end of the monarchy. The last queen was Queen Liliuokalani. The new government again tried to join the United States but was also turned down. Instead, the leaders of the government established a republic with a president in 1894. In 1898 Hawaii finally was accepted by the United States. It became the Territory of Hawaii in 1900.

On December 7, 1941, the Japanese airplanes attacked U.S. warships that were stationed at Pearl Harbor, near Honolulu. This action caused the United States to enter World War II.

In 1959 Hawaii became the 50th state in the Union. Led by a rush in tourism, the state made major economic gains after it attained statehood. Many tourists visit the wreck of the *Arizona*, a large ship that was sunk in the attack on Pearl Harbor. The ship was left in place to honor the people who died in the attack.

Hawk

Hawks are birds of prey, meaning that they hunt and kill animals for food. Hawks are closely related to eagles, kites, harriers, buzzards, and some vultures. Those birds are sometimes also called hawks because they are in the hawk family. There are about 50 kinds of “true” hawks. These include the sparrowhawks and the goshawks.

Two typical hawks are the sharp-shinned hawk and Cooper’s hawk. These hawks have a gray back and a rusty brown underside. The sharp-shinned hawk is about 12 inches (30 centimeters) long. The Cooper’s hawk is larger, with a length of about 14 to 20 inches (36 to 51 centimeters).

Hawks live in forests in most parts of the world. They usually have a long tail and short, rounded wings. These features allow them to fly fast and low in areas with bushes and trees. A hawk

The Eurasian sparrowhawk lives in forests in Europe and Asia. It also can be found in northwestern Africa.

often catches its prey by swiftly following the animal as it tries to escape. It uses its sharp claws and beak to catch and kill the animal.

Many people think hawks are harmful because some kinds eat songbirds and poultry. But most hawks are actually more useful to humans overall. They eat rodents, insects, and other pests. Hawks also eat other small animals such as squirrels and lizards.

Hawthorn

Hawthorns are trees and shrubs that are beautiful to look at but painful to touch. Like rose bushes, hawthorns have long, sharp thorns covering their branches. The thorns protect the plant from damage by animals. Hawthorns grow in cool-climate areas of Europe, Asia, and North America.

Hawthorns are usually small trees or large shrubs. Some hawthorns can grow to about 30 feet (9 meters) tall. They have scaly, gray bark. Their oval leaves have teeth or rounded sections along the edges. Hawthorns shed their leaves in the autumn. In late spring and early summer white or pink flowers bloom. When the flowers die, small red fruits appear.

A row of hawthorns planted together makes a good hedge. The sharp thorns prevent animals or intruders from passing through. Songbirds and small ani-

Hawthorn trees produce white or pink flowers once a year.

mals may also hide from predators among the sharp thorns. The fruit from hawthorns can be eaten fresh or made into jelly. Birds also eat the fruit. Hummingbirds and insects drink a sweet liquid called nectar from the flowers.

Hayes, Rutherford B.

Rutherford B. Hayes was the 19th president of the United States. He was elected in 1876. Many people argued about whether the election was fair.

Early Life and Career

Rutherford Birchard Hayes was born on October 4, 1822, in Delaware, Ohio. His father, farmer Rutherford Hayes, died before Rutherford was born. His mother, Sophia Birchard, educated him at home.

Hayes graduated from Kenyon College in 1842. After studying law at Harvard University, he started a law practice in Cincinnati. He also joined the new Republican Party. In 1852 Hayes married Lucy Ware Webb. They had eight children.

After fighting in the American Civil War, Hayes entered the U.S. House of Representatives in 1865. He was reelected to the House in 1866. Hayes then served three terms as governor of Ohio.

Election of 1876

In 1876 the Republicans chose Hayes as their candidate for president. His Democratic opponent was Samuel J. Tilden, governor of New York. Tilden won the popular vote, but the results in the electoral college were uncertain. The Republicans said the voting results from three Southern states were wrong. In

Rutherford B. Hayes

TIMELINE

Hayes is born in Delaware, Ohio.

October 4, 1822

Hayes is elected president.

1877

Hayes signs a law to allow women lawyers to practice before the Supreme Court.

1879

Hayes dies in Fremont, Ohio.

January 17, 1893

Hayes becomes governor of Ohio.

1868

Hayes ends Reconstruction in the South.

1877

Hayes retires from the presidency.

1881

January 1877 Congress set up a commission to decide the election. On March 2 the commission, made up of eight Republicans and seven Democrats, decided in favor of Hayes. The decision angered many Democrats.

Presidency

As president, Hayes ended the period known as Reconstruction. This was the period following the Civil War when the country worked to bring the Southern states back into the Union. He took U.S. troops out of the South. He gave Southern states control of their elections. He also appointed Southerners to government offices. Hayes's policies toward the South angered conservative Republicans known as the Stalwarts.

The Stalwarts also disagreed with Hayes's efforts to end the "spoils system." In that system the government gave out jobs as political rewards. Hayes wanted to give the jobs to people who

passed a test. Congress refused to change the system, but people became more aware of its problems.

Retirement

Hayes did not run for reelection in 1880. In retirement he was involved in several causes. Most notably he worked to improve prisons and to provide better education for African Americans in the South. He died in Fremont, Ohio, on January 17, 1893.

Heart

The heart is the organ, or body part, that pumps blood through the body. It is the main organ of the cardiovascular system. The cardiovascular system carries substances to and from all parts of the body in the blood.

Blood enters the right atrium of the heart. It flows into the right ventricle, through the lungs, and into the left atrium. Finally, it passes into the left ventricle and then leaves the heart.

The Human Heart

The human heart is pear-shaped and slightly larger than a fist. It is located high in the chest, slightly to the left. The heart of a grown-up person weighs about 8 to 12 ounces (230 to 340 grams).

The heart is made of very strong muscle. This muscle pumps blood by squeezing and relaxing in a regular rhythm. This rhythm is called the heartbeat. The heart

muscle beats an average of 70 times per minute. More than 4 quarts (3.8 liters) of blood pass through the heart every minute.

The human heart is divided into right and left halves. Each half is divided into two hollow sections called chambers. The upper chambers are called atria. (Each of these chambers is called an atrium.) The lower chambers are called ventricles.

Blood from the body flows into the right atrium. This blood carries a waste product called carbon dioxide. The blood then passes into the right ventricle. The right ventricle pumps the blood to the lungs. In the lungs, blood picks up oxygen and releases carbon dioxide. The oxygen-rich blood enters the heart's left atrium. The blood then passes into the left ventricle. The left ventricle pumps the blood throughout the body.

Problems with the heart include irregular heartbeat and heart disease. Irregular heartbeat is a heartbeat that is too slow,

A patient runs while a machine records his heartbeats. The machine tells doctors whether the patient's heart is healthy.

too fast, or unsteady. Heart disease happens when fatty substances build up inside blood vessels. The fatty deposits block blood from getting to the heart. Heart disease can lead to a heart attack. A heart attack happens when part of the heart muscle dies. Exercise and eating a healthy diet can help to keep the heart healthy.

The Hearts of Other Animals

Like the human heart, the hearts of mammals and birds have four chambers. The hearts of other animals are different. Amphibians and lizards have hearts with three chambers. Fishes' hearts are folded tubes, with three or four sections that are like chambers. Spiders and some worms have hearts that are straight tubes.

Heat

Heat is a form of energy. Heat flows from hot objects to cool objects. It flows from one object to another because of

The heat of a fire cooks peppers on a grill.

their difference in temperature. The cool object absorbs the energy and becomes warmer.

Objects are made of particles, or bits, called molecules. Molecules are always in motion. As an object is heated, the molecules in the object move faster. When this happens, the temperature of the object rises.

Heat travels in three ways: by conduction, by convection, and by radiation. Conduction is the flow of heat inside an object. It is also the flow of heat between objects in contact with each other. An example is the flow of heat from a hot frying pan to food placed on the pan to cook.
